

Progress Report at the JCSDA 08 Annual Meeting

**Evaluating the NCEP Global Forecast System
Cloud Vertical Structure against MODIS,
CloudSat/Calipso Retrievals**

Zhanqing Li
University of Maryland

Comparisons of High, Mid, Low Cloud Amounts

Data Sources

Three sources of cloud information used in this study:

- ❖ Official MODIS and our own MODIS products
- ❖ NCEP Global Forecast System model output
- ❖ CloudSat/CALIPSO merged radar/lidar product

*Years/Dates chosen for study: January, April, July, October
2006 and 2007*

Sampling: days 2, 6, 10, 14, 18, 22, 26, 30 in each month

Chang and Li (2005) Algorithm

novel approach toward retrieval of single-layer and overlapped clouds and optical properties using MODIS satellite data

- ❖ takes full advantage of multi-spectral channels available from the Moderate Resolution Imaging Spectroradiometer (MODIS) on the Terra and Aqua platforms
- ❖ combines the MODIS CO₂-slicing method with traditional IR and VIS techniques to overcome some limitations due to single-layer cloud assumptions used by conventional satellite cloud retrieval methods

NCEP Global Forecast System (grid 003)

- ❖ Global Latitude/Longitude 1 deg Resolution
- ❖ Control time chosen: 00Z
Forecast times chosen: 03, 06, 09, 12, 15, 18, 21, 24Z
- ❖ Variables extracted:
 - high, middle, and low cloud cover
 - cloud-top and cloud-base pressures
 - converted to km using relation:
 $44307.693 [1-(\text{pressure}/1013.25)^{0.190284}]/1000$
- ❖ Data availability (daily) : off-line Feb. 15, 2005 to May 31, 2007
on-line June 1, 2007 to current date

CloudSat/Calipso

- ❖ As part of the A-train constellation, CloudSat is the first satellite-based millimeter-wavelength cloud radar
 - 94-GHz nadir-looking
 - 4 km (along-track) by 1.4 km (cross-track) footprint
 - 0.5 km vertical resolution between the surface and 25 km
- ❖ Goal is to obtain cloud profile information, liquid & ice water content profiles and precipitation information to aid in the quantitative evaluation of global atmospheric circulation models
- ❖ In operation collecting data since May 2006

Cloud-Aerosol Lidar and Infrared Pathfinder Satellite Observations (CALIPSO)

Primary objective is to make a global survey of the vertical structure of clouds and aerosols and their physical properties

❖ Comprised of three instruments:

- Cloud-Aerosol Lidar with Orthogonal Polarization

provides information re: composition of clouds, abundance and sizes of aerosols, altitudes of cloud and aerosol layers

- Imaging Infrared Radiometer

measures outgoing radiation (at 8.65, 10.6, and 12.0 μm) to determine cloud emissivity and particle size

- Wide-Field Camera

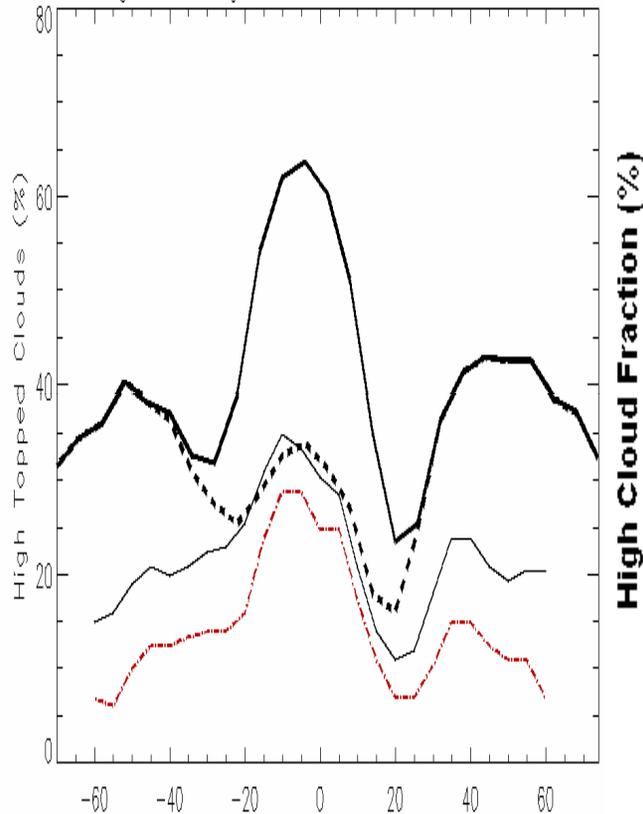

nadir-viewing, taking images of the region around the CALIOP and IIR measurements at 645nm

Overall Comparison

Comparison of High-Level Clouds

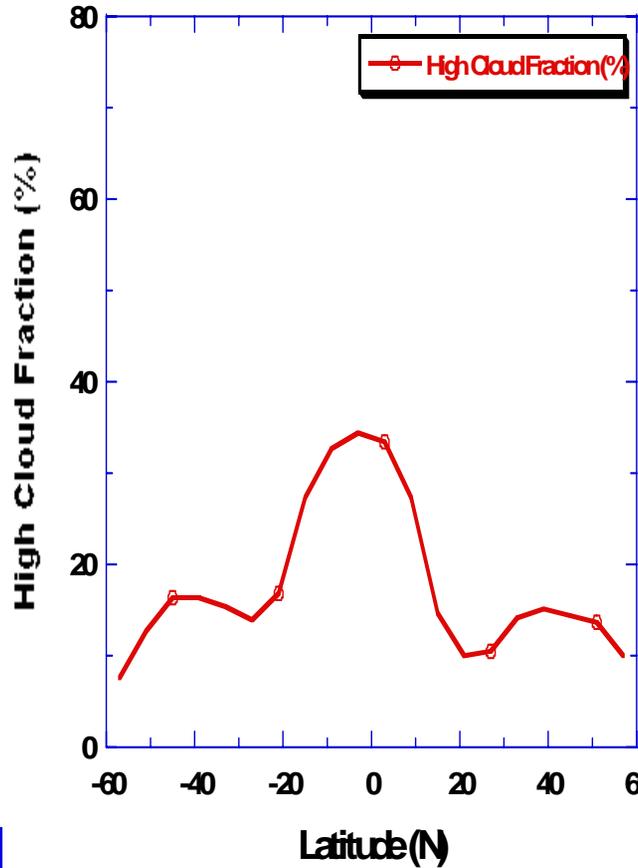

CloudSat + Calipso

High Topped (no TTL) Zonal Cloud Cover Comparison
CC-Solid (thick black), ISCCP-solid (thin black), CERES-Dash Dot (Red)
Avg Box: 6.0Degrees Lat For Period 200612-200702

Comparison of Mean Cloud Thickness between GFS and CC

Comparison of Median-Layer Thickness between GFS and CC

Major findings

- The spatial patterns and latitudinal variation of cloud from all three sources bear great resemblance
- Large discrepancies exist among all three products
- In general, the GFS modeled clouds are more similar to the MODIS retrieved clouds than to CC clouds
- The GFS model tends to generate less high clouds, more middle clouds and less low clouds than C-C clouds
- The GFS produces far less cirrus cloud in the tropics
- The GFS clouds are generally too thin by about 50%
- Many regional features are yet to be explored, e.g. too much clouds over deserts, too little over cold oceans, ...

Future plan

- We shall continue to validate MODIS clouds against CC clouds, and between the two MODIS-based products
- We shall continue to evaluate the GFS model to find any dependence of the discrepancies on atmospheric and surface environments and weather regimes
- We shall gain further insights into the causes of the discrepancies by working closely with the modelers
- We shall match and analyze more datasets to fully understand the problems.
- Finally, we shall take a little break especially for Maureen and Hyelim !
