Review Agenda
Part II – April 19th

- Ice Thickness/Age  8:30 am – 9:30 am  Wang
- Software Architecture & Interface  9:30 am – 10:10 am  Wolf
- Detailed Design  10:10 am – 10:30 am  Wolf
- Quality Assurance  10:30 am – 10:45 am  Wolf
- Algorithm Package  10:45 am – 10:55 am  Wolf
- Risks & Actions  10:55 am – 11:05 am  Wolf
- Summary and Conclusions  11:05 am – 11:30 am  Wolf
Outline

- Algorithm Package
- Quality Assurance
- Risks and Actions Summary
- Summary and Conclusions
Introduction

Presented by

Walter Wolf
Contents

• Project Objectives
• Stakeholders
• Teams
• Project Plan
• Entry and Exit Criteria
Project Background

- NWS requests continuity of NOAA products between current and future NOAA operational satellites
- Demonstration of cost effective processing for NOAA JPSS products
- Demonstration of NOAA’s goal of enterprise solutions by employing same algorithms for “POES” and “GOES”
- Supports NWS OS&T implementation strategy of multi-sensor algorithms and products
Disseminate JPSS/S-NPP Data Records to customers.

Generate and disseminate tailored JPSS/S-NPP Data Records (versions of JPSS/S-NPP Data Records in previously agreed alternative formats and views).

Generate and disseminate NOAA-unique products (augmented environmental products constructed from JPSS/S-NPP Data Records).

Deliver NOAA-unique products, product processing elements, and associated metadata to CLASS for long-term archiving.

Provide services to customers, including NDE product training, product enhancement, and implementation support across NOAA.

Provide software for JPSS/S-NPP Data Record format translation and other
Project Objectives

- Modification of the NOAA Heritage Cloud, Cryosphere, Volcanic Ash, and Aerosol algorithms to work on VIIRS data
- This will bring scientific consistency between the current operational products, GOES-R products and VIIRS products
- Run the product system within NDE
Products Objectives
Cloud Products

- Cloud Mask
- Cloud Top Phase
- Cloud Type
- Cloud Top Height
- Cloud Cover Layers
- Cloud Top Temperature
- Cloud Top Pressure
- Cloud Optical Depth
- Cloud Particle Size Distribution
- Cloud Liquid Water
- Cloud Ice Water Path
Aerosol Detection
Aerosol Optical Depth
Aerosol Particle Size
Volcanic Ash Mass Loading
Volcanic Ash Height
Products Objectives
Cryosphere Products

- Snow Cover
- Ice Concentration and Cover
- Ice Surface Temperature
- Ice Thickness/Age
JPSS Risk Reduction
Integrated Product Team

- IPT Lead: Walter Wolf (STAR)
- IPT Backup Lead: AK Sharma (OSPO)
- NESDIS team:
  - STAR: Andy Heidinger, Jeff Key, Shobha Kondragunta, Istvan Laszlo, Mike Pavolonis
  - OSPO: Gilberto Vicente, Hanjun Ding, Zhaohui Cheng
  - OSD: Tom Schott, Jim Silva, Geof Goodrum
  - NOAA JPSS: Mitch Goldberg
  - NIC: Sean Helfrich
  - Data Center: Lei Shi (NCDC)
  - Others: Shanna Sampson, Peter Romanov, Xingpin Liu, William Straka III, Ray Garcia
- User team
  - Lead: Kevin Schrab (NWS) Mike Johnson (NWS), John Derber (NWS/NCEP/EMC), Jeff Ator (NWS/NCEP/NCO), Lars Peter-Riishojgaard (JCSDA), Gary Hufford (NWS), VAACs
  - Others: International NWP users, NWP FOs, Climate Users
- Sounding Product Oversight Panel
- Other POPs involved: EPOP, ICAPOPOP, CAL/NAVPOP, ACPOP, SURPOP
Project Stakeholders

- OSPO
- STAR
- OSD
- NOAA National Weather Service
- Department of Defense
- Global NWP
Project Plan

- Year 1 – Design and Development (2012 – 2013)
  - Develop Requirements Document
  - Product leads to identify updates to the algorithms to work with VIIRS data
  - Identify ancillary data for the algorithms
  - Conduct CDR
  - Algorithm development
  - Implement algorithms within the Framework
  - Conduct TRR
Project Plan

• Transition to Pre-Operations (2014 – 2016)
  » Deliver initial DAP (Framework with pre-operational algorithms) to NDE
  » Conduct Software Review
  » Update algorithms
  » Transition and test system within the NDE environment
  » Perform test data flows
  » Conduct Algorithm Readiness Review
  » Deliver final DAP to NDE
Project Timeline
Year 2

Project Plan
Cryosphere Schedule

- Schedule (Milestones)
  » Project begins – 10/05/12
  » Requirements Review – 12/27/12 (10/31/12)
  » Critical Design Review – 04/05/13 (12/31/12)
  » Test Readiness Review – 10/31/13 (05/31/13, 08/30/13, 10/31/13)
  » Software Review – 02/28/14 (02/28/14)
  » System Readiness Review – 05/30/14 (05/30/14)
CDR Entry Criteria

- Reviewed Requirements Document

- Review of JPSS RRPS Project:
  - Requirements
  - Operations Concept
  - Algorithm Theoretical Basis
  - Software Architecture & Interfaces
  - Detailed Design
  - Algorithm Package
  - Quality Assurance
  - Risks and Actions
CDR Exit Criteria

- Critical Design Review Report
  - The CDR Report (CDRR), a standard artifact of the SPSRB Process Lifecycle, will be compiled before the TRR
  - The report will contain:
    - Actions
    - Comments
    - CDR presentation
Outline

- Introduction
- **Requirements**
- Operations Concept
- Snow Cover
- Ice Cover and Concentration
- Ice Surface Temperature
- Ice Thickness/Age
- Software Architecture and Interfaces
- Design Overview and System Description
- Algorithm Package
- Quality Assurance
- Risks and Actions Summary
- Summary and Conclusions
Requirements for JPSS Risk Reduction: Uniform Multi-Sensor Algorithms for Consistent Products

Presented by
Walter Wolf
All JPSS Risk Reduction System Project requirements are present in this section.

All JPSS Risk Reduction System Project requirements are documented in a single RAD located in the project repository at:

Basic requirements are shown in all yellow text on a single slide.
• **JPSS-PS-R 0.0:** The JPSS Risk Reduction Product System (JPSS RRPS) development project shall adopt the standard practices of the Satellite Product and Services Review Board (SPRB).

  » **Driver:** STAR Enterprise Product Lifecycle (EPL). The SPSRB process has been updated by incorporating aspects of the STAR EPL Process.
Basic Requirement 0.0

- **GOES-PS-R 0.1**: The JPSS RRPS development project practices shall be tailored from the SPSRB process.

  » This requirement should be met by following the SPSRB process, as long as the tailoring does not introduce an incompatibility.
Basic Requirement 1.0

- **JPSS-PS-R 1.0:** *The JPSS RRPS shall generate Global Cloud products.*

- **Driver:** SPSRB requirements:
  - 1107-0011: Gridded Cloud Products for NWP Verification
  - 0909-0018: CLAVR-x and GSIP cloud product composites over Alaska
Basic Requirement 1.0

• **JPSS-PS-R 1.1:** The Cloud products shall include Cloud Mask, Cloud Phase, Cloud Type, Cloud Top Height, Cloud Cover Layers, Cloud Top Temperature, Cloud Top Pressure, Cloud Optical Depth, Cloud Particle Size Distribution, Cloud Ice Water Path, Cloud Liquid Water.

  » Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.1.1:** The Cloud Mask Product shall have accuracy of 90% correct detection.

- **JPSS-PS-R 1.1.2:** The Cloud Phase Product shall have accuracy of 80% Correct Classification (5 phases).

- **JPSS-PS-R 1.1.3:** The Cloud Type Product shall have accuracy of 60% correct classification (7 categories).

» Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.1.4:** The Cloud Top Height Product shall have accuracy of 500 m for clouds with emissivity > 0.8.

- **JPSS-PS-R 1.1.5:** The Cloud Cover Layers Product shall have accuracy of 80% Correct Classification (Low, Mid, High).

- **JPSS-PS-R 1.1.6:** The Cloud Top Temperature Product shall have accuracy of 3 K for clouds with emissivity > 0.8.

» Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.1.7**: The Cloud Top Pressure Product shall have accuracy of 50 mb for clouds with emissivity $> 0.8$.

- **JPSS-PS-R 1.1.8**: The Cloud Optical Depth Product shall have accuracy of better than:
  - Liquid phase:
  - 20% error (Day), 20% (Night);
  - Ice phase:
  - 20% (Day), 30% (Night)
  - Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.1.9**: The Cloud Particle Size Distribution Product shall have accuracy of:
  - 4 µm for liquid phase
  - 10 µm for ice phase

- **JPSS-PS-R 1.1.10**: The Cloud Ice Water Path Product shall have accuracy of greater of 25g/m² or 30% error.

- **JPSS-PS-R 1.1.11**: The Cloud Liquid Water Product shall have accuracy of greater of 25g/m² or 15% error.
  
  » Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.1.12**: The Cloud Mask Product shall have horizontal resolution of 0.75 km.

- **JPSS-PS-R 1.1.13**: The Cloud Phase Product shall have horizontal resolution of 0.75 km.

- **JPSS-PS-R 1.1.14**: The Cloud Type Product shall have horizontal resolution of 0.75 km.

» Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.1.15**: The Cloud Top Height Product shall have horizontal resolution of 0.75 km.

- **JPSS-PS-R 1.1.16**: The Cloud Cover Layers Product shall have horizontal resolution of 0.75 km.

- **JPSS-PS-R 1.1.17**: The Cloud Top Temperature Product shall have horizontal resolution of 0.75 km.

» Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.1.18:** The Cloud Top Pressure Product shall have horizontal resolution of 0.75 km.

- **JPSS-PS-R 1.1.19:** The Cloud Optical Depth Product shall have horizontal resolution of 0.75 km.

- **JPSS-PS-R 1.1.20:** The Cloud Particle Size Distribution Product shall have horizontal resolution of 0.75 km.

» Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.1.21:** The Cloud Ice Water Pass Product shall have horizontal resolution of 0.75 km.

- **JPSS-PS-R 1.1.22:** The Cloud Liquid Water Product shall have horizontal resolution of 0.75 km.

» Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.2**: The Cloud Products shall have global coverage.
  - Current operational products, with upgraded capabilities.

- **JPSS-PS-R 1.2.1**: The Cloud Products shall have latency of 30 minutes after granule data is available.
  - Latency is defined as the interval from the last observation to when the product is available to users. Current capability is 60 minutes.
Basic Requirement 1.0

- **JPSS-PS-R 1.2.2**: The Cloud Products shall at least 90% coverage of the globe every 12 hours (monthly average).

- **JPSS-PS-R 1.2.3**: The Cloud Products shall have timeliness of ≤ 3 hours.

» Current operational products, with upgraded capabilities.
Basic Requirement 1.0

- **JPSS-PS-R 1.3**: The Cloud Products shall include quality information.
  
  » QC flags will be specified in the External Users Manual.

- **JPSS-PS-R 1.4**: The JPSS RRPS shall write Cloud Products files in NetCDF4 formats.
  
  » SPSRB requirement
• **JPSS-PS-R 1.5:** The JPSS RRPS developers shall perform validation and verification of the Cloud Products.

  » Validation tools will be based upon the GOES-R validation tools and/or the heritage validation tools

• **JPSS-PS-R 1.5.1:** The JPSS RRPS developers shall plot datasets for verification of the Cloud Products.
Basic Requirement 1.0

- **JPSS-PS-R 1.5.2:** The JPSS RRPS developers shall verify that Cloud Products files are generated correctly.
  
  » Will be included in the unit tests described in the UTR and the system test described in the SRR.

- **JPSS-PS-R 1.5.3:** The JPSS RRPS system shall perform routine data range checks to flag anomalous values in the input data.
  
  » Anomalous values will be flagged. These checks will be included in the code and described in the SRR.
Basic Requirement 1.0

- **JPSS-PS-R 1.5.4**: The JPSS RRPS system shall perform routine data range checks to flag anomalous values in the Cloud Products.
  
  » Out-of-range values will be flagged. These checks will be included in the code. UTR will address.

- **JPSS-PS-R 1.5.5**: The JPSS RRPS developers shall generate matchup datasets between Cloud Products retrievals and in situ measurements.
  
  » In situ data obtained from NCEP & ECMWF analysis, SURFRAD measurements, and CALIPSO data.
Basic Requirement 2.0

- **JPSS-PS-R 2.0:** *The JPSS RRPS shall generate Aerosol Products.*

**Driver:** SPSRB requirements:
- 1009-0016: Dust Aerosol Concentration Product
- 0707-0014: Support satellite-based verification of the National Air Quality Forecast Capability
Basic Requirement 2.0

- **JPSS-PS-R 2.1:** The Aerosol Products shall include Aerosol Optical Depth and Aerosol Detection.

- **JPSS-PS-R 2.1.1:** The Aerosol Optical Depth Product shall have accuracy based on Aerosol Optical Depth ranges:
  - Over land:
    - $< 0.04$: 0.06
    - $0.04 - 0.80$: 0.04
    - $> 0.80$: 0.12
  - Over water:
    - $< 0.40$: 0.02
    - $> 0.40$: 0.10

Current operational product, with upgraded capabilities.
• **JPSS-PS-R 2.1.2:** The Aerosol Detection Product shall have accuracy:
  » Dust: 80% correct detection over land and ocean
  » Smoke: 80% Correct detection over land; 70% correct detection over ocean

• **JPSS-PS-R 2.1.3:** The Aerosol Optical Depth Product shall have horizontal resolution of 0.75 km (nadir).

• **JPSS-PS-R 2.1.4:** The Aerosol Detection Product shall have horizontal resolution of 0.75 km.

» Current operational products, with upgraded capabilities.
• **JPSS-PS-R 2.2:** The Aerosol Products shall have global coverage.
  
  » Current operational products, with upgraded capabilities.

• **JPSS-PS-R 2.2.1:** The Aerosol Products shall have latency of 30 minutes after granule data is available.
  
  » Latency is defined as the interval from the last observation to when the product is available to users. Current capability is 60 minutes.
Basic Requirement 2.0

- **JPSS-PS-R 2.2.2**: The Aerosol Products shall have at least 90% coverage of the globe every 12 hours (monthly average).

- **JPSS-PS-R 2.2.3**: The Aerosol Products shall have timeliness of ≤ 3 hours.

  » Current operational products, with upgraded capabilities.
Basic Requirement 2.0

• **JPSS-PS-R 2.3:** The Aerosol Products shall include quality information.
  » QC flags will be specified in the External Users Manual.

• **JPSS-PS-R 2.4:** The JPSS RRPS shall write Aerosol Products files in NetCDF4 formats.
  » SPSRB requirement
Basic Requirement 2.0

• **JPSS-PS-R 2.5:** *The JPSS RRPS developers shall perform validation and verification of the Aerosol Products.*
  
  » Validation tools will be based upon the GOES-R validation tools

• **JPSS-PS-R 2.5.1:** *The JPSS RRPS developers shall plot datasets for verification of the Aerosol Products.*
JPSS-PS-R 2.5.2: The JPSS RRPS developers shall verify that Aerosol Products files are generated correctly.

» Will be included in the unit tests described in the UTR and the system test described in the SRR.

JPSS-PS-R 2.5.3: The JPSS RRPS system shall perform routine data range checks to flag anomalous values in the input data.

» Anomalous values will be flagged. These checks will be included in the code and described in the SRR.
Basic Requirement 2.0

- **JPSS-PS-R 2.5.4:** The JPSS RRPS system shall perform routine data range checks to flag anomalous values in the Aerosol Products.
  
  » Out-of-range values will be flagged. These checks will be included in the code. UTR will address.

- **JPSS-PS-R 2.5.5:** The JPSS RRPS developers shall generate matchup datasets between Aerosol Products retrievals and in situ measurements.
  
  » In situ data obtained from AERONET Measurements
Basic Requirement 3.0

- **JPSS-PS-R 3.0:** The JPSS RRPS shall generate Volcanic Ash Products.

- **Driver:** SPSRB requirements:
  0507-05: Polar/Geostationary Volcanic Ash Detection and Height on CLAVR-X
Basic Requirement 3.0

- **JPSS-PS-R 3.1**: The Volcanic Ash Products shall include Volcanic Ash Detection (Mass Loading) and Height.

- **JPSS-PS-R 3.1.1**: The Volcanic Ash Detection (Mass Loading) and Height Product shall have accuracy:
  - 2 tons/km², 3 km height.

- **JPSS-PS-R 3.1.2**: The Volcanic Ash Detection (Mass Loading) and Height Product shall have horizontal resolution of 0.75 km (nadir).
  - Current operational product, with upgraded capabilities.
Basic Requirement 3.0

- **JPSS-PS-R 3.2:** The Volcanic Ash Detection (Mass Loading) and Height Products shall have global coverage.
  - Current operational products, with upgraded capabilities.

- **JPSS-PS-R 3.2.1:** The Volcanic Ash Detection (Mass Loading) and Height Product shall have latency of 30 minutes after granule data is available.
  - Latency is defined as the interval from the last observation to when the product is available to users. Current capability is 60 minutes.
• **JPSS-PS-R 3.2.2:** The Volcanic Ash Detection (Mass Loading) and Height Product shall have at least 90% coverage of the globe every 12 hours (monthly average).

  » Current operational product, with upgraded capabilities.

• **JPSS-PS-R 3.2.3:** The Volcanic Ash Detection (Mass Loading) and Height Product shall have timeliness of $\leq 3$ hours.

  » Current operational product, with upgraded capabilities.
Basic Requirement 3.0

- **JPSS-PS-R 3.3:** The Volcanic Ash Detection (Mass Loading) and Height Product shall include quality information.
  
  » QC flags will be specified in the External Users Manual.

- **JPSS-PS-R 3.4:** The JPSS RRPS shall write Volcanic Ash Detection (Mass Loading) and Height Product files in NetCDF4 formats.
  
  » SPSRB requirement.
Basic Requirement 3.0

- **JPSS-PS-R 3.5:** The JPSS RRPS developers shall perform validation and verification of the Volcanic Ash Detection (Mass Loading) and Height Product.

  » Validation tools will be based upon the GOES-R validation tools

- **JPSS-PS-R 3.5.1:** The JPSS RRPS developers shall plot datasets for verification of the Volcanic Ash Detection (Mass Loading) and Height Products.
Basic Requirement 3.0

- **JPSS-PS-R 3.5.2:** The JPSS RRPS developers shall verify that Volcanic Ash Detection (Mass Loading) and Height Products files are generated correctly.
  
  » Will be included in the unit tests described in the UTR and the system test described in the SRR.

- **JPSS-PS-R 3.5.3:** The JPSS RRPS system shall perform routine data range checks to flag anomalous values in the input data.
  
  » Anomalous values will be flagged. These checks will be included in the code and described in the SRR.
• **JPSS-PS-R 3.5.4:** The JPSS RRPS system shall perform routine data range checks to flag anomalous values in the Volcanic Ash Detection (Mass Loading) and Height Products.

  » Out-of-range values will be flagged. These checks will be included in the code. UTR will address.

• **JPSS-PS-R 3.5.5:** The JPSS RRPS developers shall generate matchup datasets between Volcanic Ash Detection (Mass Loading) and Height Products retrievals and in situ measurements.

  » In situ data obtained from CALIPSO data.
Basic Requirement 4.0

- **JPSS-PS-R 4.0:** The JPSS RRPS shall generate Cryosphere Products.

  - *Driver:* SPSRB requirements:
Basic Requirement 4.0

- **JPSS-RRPS-R 4.1**: The Cryosphere Products shall include Ice Concentration, Ice Age, Ice Surface Temperature, and Snow Cover.
  - Continuity with GOES-R product, upgraded VIIRS capability

- **JPSS-RRPS-R 4.1.1**: The Ice Concentration Product shall have accuracy of 10% Uncertainty.
  - Continuity with GOES-R product, upgraded VIIRS capability
Basic Requirement 4.0

- **JPSS-RRPS-R 4.1.2:** The Ice Age Product shall have accuracy:
  - 80% correct classification (Ice free areas, First year ice, Older ice)
  - Continuity with GOES-R product, upgraded VIIRS capability

- **JPSS-RRPS-R 4.1.3:** The Ice Surface Temperature Product shall have accuracy of 1K.
  - Continuity with GOES-R product, upgraded VIIRS capability
• **JPSS-RRPS-R 4.1.4:** The Ice Snow Cover Product shall have accuracy of 90% correct classification.

  » Continuity with GOES-R product, upgraded VIIRS capability

• **JPSS-RRPS-R 4.1.5:** The Ice Concentration Product shall have horizontal resolution of 0.75 km.

  » Continuity with GOES-R product, upgraded VIIRS capability
Basic Requirement 4.0

- **JPSS-RRPS-R 4.1.6:** The Ice Age Product shall have horizontal resolution of 0.75 km.
  - Continuity with GOES-R product, upgraded VIIRS capability

- **JPSS-RRPS-R 4.1.7:** The Ice Surface Temperature Product shall have horizontal resolution of 0.75 km.
  - Continuity with GOES-R product, upgraded VIIRS capability

- **JPSS-RRPS-R 4.1.8:** The Snow Cover Product shall have horizontal resolution of 0.375 km.
  - Current operational product, with upgraded capabilities.
Basic Requirement 4.0

- **JPSS-RRPS-R 4.2:** The Cryosphere Products shall have **global coverage**.
  - Current operational products, with upgraded capabilities.

- **JPSS-RRPS-R 4.2.1:** The Cryosphere Products shall have **latency of 30 minutes after granule data is available**.
  - Latency is defined as the interval from the last observation to when the product is available to users. Current capability is 60 minutes.
Basic Requirement 4.0

- **JPSS-RRPS-R 4.2.2**: The Cryosphere Products shall have at least 90% coverage of the globe every 12 hours (monthly average).
  
  » Current operational products, with upgraded capabilities.

- **JPSS-RRPS-R 4.2.3**: The Cryosphere Product shall have timeliness of \( \leq 3 \) hours.
  
  » Current operational product, with upgraded capabilities.
Basic Requirement 4.0

- **JPSS-RRPS-R 4.3:** The Cryosphere Products shall include quality information.
  
  » QC flags will be specified in the External Users Manual.

- **JPSS-RRPS-R 4.4:** The JPSS RRPS shall write Cryosphere Products files in NetCDF4 formats.
  
  » SPSRB requirement.
Basic Requirement 4.0

- **JPSS-RRPS-R 4.5**: The JPSS RRPS developers shall perform validation and verification of the Cryosphere Products.
  
  » Validation tools will be based upon the GOES-R validation tools

- **JPSS-RRPS-R 4.5.1**: The JPSS RRPS developers shall plot datasets for verification of the Cryosphere Products.
**Basic Requirement 4.0**

- **JPSS-RRPS-R 4.5.2:** The JPSS RRPS developers shall verify that Cryosphere Products files are generated correctly.
  
  » Will be included in the unit tests described in the UTR and the system test described in the SRR

- **JPSS-RRPS-R 4.5.3:** The JPSS RRPS system shall perform routine data range checks to flag anomalous values in the input data.
  
  » Anomalous values will be flagged. These checks will be included in the code and described in the SRR.
Basic Requirement 4.0

- **JPSS-RRPS-R 4.5.5:** The JPSS PS developers shall generate matchup datasets between Cryosphere Products retrievals and in situ measurements.

  - In situ data obtained from NCEP & ECMWF analysis, AMSR-E products, Upward Looking Sonar data, Canadian Ice Service measurements and Buoy data.
• **JPSS-RRPS-R 5.0:** *The JPSS PS system shall have a data ingest capability.*

  » **Driver:** This basic requirement is traced to algorithm input needs, as documented in the Algorithm Theoretical Basis Documents (ATBDs).
Basic Requirement 5.0

- **JPSS-RRPS-R 5.1:** The JPSS PS system shall ingest NPP VIIRS L1 data.

  Required algorithm input. Ingest from the IDPS. Data link for development is established by NDE.
Basic Requirement 6.0

JPSS-RRPS-R 6.0: The JPSS RRPS developers shall modify the GOES-R algorithms to generate a retrieval of Cloud Products, Aerosol Products, Volcanic Ash Products, and Cryosphere Products.

Driver: This basic requirement is traced to user needs for Cloud Mask products.
Basic Requirement 6.0

- **JPSS-RRPS-R 6.1:** The JPSS RRPS Algorithms shall be implemented by processing codes written in C, C++ and Fortran 90.
  - Adaptation of current algorithm/framework code.

- **JPSS-RRPS-R 6.1.1:** The JPSS RRPS processing code shall be able to run in the Development Environment (Linux with 12 dual core 2.33 GHz CPUs).
  - S/W: Intel Compiler (C/C++/Fortran) and IDL for Validation
  - Storage: 100 TB
  - C code, C++ code, and Fortran code can run in this environment
Basic Requirement 6.0

- **JPSS-RRPS-R 6.1.2:** The JPSS RRPS processing code shall be able to run in the NDE Test Environment (Linux machine with 6 quad core 3.2 GHz CPUs)
  - S/W: Intel Compiler (C/C++/Fortran) and IDL for Validation
  - Storage: 30 TB
  - C code, C++ code, and Fortran code can run in this environment

- **JPSS-RRPS-R 6.1.3:** The JPSS RRPS processing code shall be able to run in the OSPO Operations Environment: (Linux machine with 6 quad core 3.2 GHz CPUs)
  - S/W: Intel Compiler (C/C++/Fortran) and IDL for Validation
  - Storage: 30 TB
  - C code, C++ code, and Fortran code can run in this environment
Basic Requirement 7.0

- **JPSS-RRPS-R 7.0**: The JPSS RRPS system shall generate metadata for each retrieved product.

  » **Driver**: Metadata will be used by the Product Monitoring Project
Basic Requirement 7.0

- **JPSS-RRPS-R 7.1:** *The JPSS RRPS system shall write a metadata text files associated with the retrieved products.*
  - Coordinate with the Product Monitoring Project.

- **JPSS-RRPS-R 7.1.1:** *The metadata shall include overall quality and summary level metadata.*
  - Coordinate with the Product Monitoring Project.
Basic Requirement 7.0

- **JPSS-RRPS-R 7.1.2**: The metadata shall include Granule metadata.
  » Coordinate with the Product Monitoring Project.

- **JPSS-RRPS-R 7.1.3**: The metadata shall include product specific metadata.
  » Coordinate with the Product Monitoring Project.
Basic Requirement 8.0

- **JPSS-RRPS-R 8.0:** The JPSS RRPS system shall have QC monitoring capability.

- **Driver:** This basic requirement is traced to an OSPO need for QC monitoring.
Basic Requirement 8.0

**JPSS-RRPS-R 8.1:** The JPSS RRPS Product files shall include overall quality control flags and quality summary level metadata.

» Needed for distribution, quality control and post-processing. JPSS PS code will generate metadata for this purpose.

**JPSS-RRPS-R 8.2:** The JPSS RRPS system shall be capable of monitoring input data latency and overall quality.

» Need to import metadata from input file and create code for generating metadata.
Basic Requirement 8.0

• **JPSS-RRPS-R 8.3:** The JPSS RRPS system shall be capable of monitoring product latency.
  
  » Run status file will include processing time.

• **JPSS-RRPS-R 8.4:** The JPSS RRPS system shall produce real-time imagery for visual inspection of output files.
  
  » Will be done with IDL.
Basic Requirement 8.0

• **JPSS-RRPS-R 8.5:** The JPSS RRPS system shall be capable of monitoring product distribution status to ensure that the data/products are successfully available for transfer to the user community.

  » A run status file will be produced. Work with OSPO to determine needs.

• **JPSS-RRPS-R 8.5.1:** Each run status file shall include all runtime error messages.

  » Error messages will include system messages and error conditions written by the code.
Basic Requirement 8.0

- **JPSS-RRPS-R 8.5.2**: Each run status file shall indicate whether or not the run was completed without error.
  
  Code will write this message. This indication will be the last message in the file, so that operators can find it easily.

- **JPSS-RRPS-R 8.6**: The JPSS PS system shall write a log file for each production run.
  
  Used by OSPO for QC monitoring and troubleshooting.
Basic Requirement 8.0

- **JPSS-RRPS-R 8.6.x**: Placeholder for TBD requirements for the log file.
  - Log file requirements will be specified at the UTR.
Basic Requirement 9.0

- **JPSS-RRPS-R 9.0**: The JPSS PS developers shall produce a fully functional pre-operational system in the STAR Development Environment.

  » **Driver**: This basic requirement is traced to an NDE need for a unit-tested, fully functional system delivered to its Test Environment.
Basic Requirement 9.0

- **JPSS-RRPS-R 9.1:** The Development Environment shall be capable of hosting the conversion of JPSS RRPS science code to JPSS RRPS pre-operational code.
  
  » See derived requirements 9.1.x.

- **JPSS-RRPS-R 9.1.1:** The Development Environment shall include the INTEL FORTRAN 90/95 compiler.
  
  » Needed for the Framework FORTRAN code. Development Environment servers have this.
Basic Requirement 9.0

- **JPSS-RRPS-R 9.1:** The Development Environment shall be capable of hosting the conversion of JPSS RRPS science code to JPSS RRPS pre-operational code.
  
  » See derived requirements 9.1.x.

- **JPSS-RRPS-R 9.1.1:** The Development Environment shall include the INTEL FORTRAN 90/95 compiler.
  
  » Needed for the Framework FORTRAN code. Development Environment servers have this.
Basic Requirement 9.0

- **JPSS-RRPS-R 9.1.2:** The Development Environment shall include the INTEL C compiler.

  » Needed for the Framework C code. Development Environment servers have this.

- **JPSS-RRPS-R 9.1.3:** The Development Environment shall include the INTEL C++ compiler.

  » Needed for the Framework C++ code. Development Environment servers have this.
Basic Requirement 9.0

- **JPSS-RRPS-R 9.1.4**: The Development Environment shall include Linux machine with 100TB of disk storage.
  
  » Development Environment servers have this.

- **JPSS-RRPS-R 9.2**: The Development Environment shall be capable of hosting unit tests and a system test.

  » Unit tests and system test required prior to delivery of pre-operational system to OSPO.
Basic Requirement 9.0

- **JPSS-RRPS-R 9.2.1**: The Development Environment shall have access to the OSPO DDS/PDA.
  - For ingest of VIIRS data and GFS data.

- **JPSS-RRPS-R 9.2.2**: The Development Environment shall have access to the OSPO DDS/PDA server.
  - For ingest of IMS daily snow cover data.
Basic Requirement 9.0

- **JPSS-RRPS-R 9.3**: The Development Environment shall host the pre-operational system.

  » For development and unit testing. Complete unit test of the pre-operational system is expected before delivery to NDE.

- **JPSS-RRPS-R 9.3.1**: The pre-operational system shall include all processing code and ancillary files needed to conduct unit tests.

  » Complete unit test of the pre-operational system is expected before delivery to NDE. The UTR will provide a detailed description of the source code units and ancillary files.
**Basic Requirement 9.0**

- **JPSS-RRPS-R 9.3.2:** The pre-operational system shall include all input test data needed to conduct unit tests.
  
  » Complete unit test of the pre-operational system is expected before delivery to NDE. The UTR will provide a detailed description of the unit test data.

- **JPSS-RRPS-R 9.3.3:** The JPSS RRPS pre-operational system baseline shall be established and maintained with the Clear Case CM tool.
  
  » CM of the pre-operational system is expected throughout its development.
Basic Requirement 10.0

• **JPSS-RRPS-R 10.0:** The JPSS RRPS integrated pre-operational system shall be transitioned from the STAR Development Environment to the NDE Test Environment.

  - **Driver:** This basic requirement is traced to an NDE need for a system-tested, integrated pre-operational system delivered to its Test Environment.
Basic Requirement 10.0

- **JPSS-RRPS-R 10.1:** The Development Environment shall host the JPSS RRPS integrated pre-operational system.
  
  » For system testing. A complete system test of the integrated pre-operational system is expected before delivery to NDE.

- **JPSS-RRPS-R 10.1.1:** The integrated pre-operational system shall include all processing code and ancillary files needed to conduct the system test.
  
  Complete system test of the integrated pre-operational system is expected. The SRR will provide a description of the processing software system and ancillary files.
Basic Requirement 10.0

- **JPSS-RRPS-R 10.1.2:** The integrated pre-operational system shall include all input data needed to conduct a system test.

  » Complete system test of the integrated pre-operational system is expected. The SRR will provide a description of the system test data.

- **JPSS-RRPS-R 10.1.3:** The integrated pre-operational system shall include all output data produced by the system test.

  » Needed by NDE to verify the system test in its Test Environment. Comparison of outputs from system test in STAR and NDE environments will be part of the NDE system test. Specific items will be listed in the SRR.
Basic Requirement 10.0

- **JPSS-RRPS-R 10.1.4:** The JPSS RRPS integrated pre-operational system baseline shall be established and maintained with the Clear Case CM tool.

  » CM of the integrated pre-operational system is expected throughout its development.
Basic Requirement 10.0

- **JPSS-RRPS-R 10.2:** The JPSS RRPS development team shall set up an internal FTP site for transferring the integrated pre-operational system to NDE as a Delivered Algorithm Package (DAP).
  
  » NDE needs to reproduce the system test in its Test Environment. [ftp.star.nesdis.noaa.gov](ftp.star.nesdis.noaa.gov) is a currently functioning site that will be used.

- **JPSS-RRPS-R 10.2.1:** The JPSS RRPS development team shall ensure that the NDE PAL has the information needed to acquire the JPSS RRPS DAP from the internal FTP site.
  
  » Use of [ftp.star.nesdis.noaa.gov](ftp.star.nesdis.noaa.gov) ensures this.
Basic Requirement 11.0

- **JPSS-RRPS-R 11.0**: *STAR shall deliver a JPSS RRPS document package to OSPO.*

  » **Driver**: This basic requirement is traced to an OSPO need for documentation to support operations, maintenance, and distribution.
Basic Requirement 11.0

- **JPSS-RRPS-R 11.1:** The JPSS RRPS document package shall include a README text file.

- **JPSS-RRPS-R 11.1.1:** The README file shall list each item in the final pre-operational system baseline, including code, test data, and documentation.

  » All required deliverable items must be correctly identified
Basic Requirement 11.0

- **JPSS-RRPS-R 11.2**: The JPSS RRPS document package shall include a Review Item Disposition (RID) document.

- **JPSS-RRPS-R 11.2.1**: The RID shall describe the final status of all development project tasks, work products, and risks.

  » Supports the final System Readiness Review Report (SRRR)
Basic Requirement 11.0

- **JPSS-RRPS-R 11.3:** The JPSS RRPS document package shall include an Algorithm Theoretical Basis Document (ATBD).
  
  » The ATBD will follow SPSRB Version 2 document standards

- **JPSS-RRPS-R 11.4:** The JPSS RRPS document package include a Requirements Allocation Document (RAD).
  
  » The RAD will follow document standards stated in EPL v3 process asset DG-6.2
Basic Requirement 11.0

• **JPSS-RRPS-R 11.5:** *The JPSS RRPS document package shall include a System Maintenance Manual (SMM).*
  
  » The SMM will follow SPSRB Version 2 document standards.

• **JPSS-RRPS-R 11.6:** *The JPSS RRPS document package shall include an External Users Manual (EUM).*
  
  » The EUM will follow SPSRB Version 2 document standards.
Basic Requirement 11.0

- **JPSS-RRPS-R 11.7:** The JPSS RRPS document package shall include an Internal Users Manual (IUM).
  
  » The IUM will follow SPSRB Version 2 document standards.

- **JPSS-RRPS-R 11.8:** The JPSS RRPS document package shall include a Critical Design Document (CDD).
  
  » The CDD will follow STAR EPL document standards in DG-8.2 and DG-8.2.A.
Basic Requirement 11.0

- **JPSS-RRPS-R 11.9:** The JPSS RRPS document package shall include a Code Test Document (CTD).
  - The CTD will follow STAR EPL document standards in DG-10.3 and DG-10.3.A.

- **JPSS-RRPS-R 11.10:** The JPSS RRPS document package shall include a System Readiness Document (SRD).
  - The SRD will follow STAR EPL document standards in DG-11.5 and DG-11.5.A.
Basic Requirement 11.0

- **JPSS-RRPS-R 11.11:** The JPSS RRPS document package shall include a System Readiness Review Report (SRRR).
  
  » The SRRR will follow document standards stated in EPL v3 process asset DG-11.6

- **JPSS-RRPS-R 11.11.1:** The SRRR shall document the approved readiness of the JPSS RRPS system for transition to operations.
  
  » This is an SRR exit criteria item
Basic Requirement 12.0

- **JPSS-RRPS-R 12.0**: The JPSS RRPS system shall undergo an OSPO Code Review Security for security compliance

  » **Driver**: OSPO Security
• **JPSS-RRPS-R 12.1:** The JPSS RRPS system shall comply with OSPO data integrity check list.

  » OSPO data integrity check list is part of the OSPO Code Review Security check lists.

• **JPSS-RRPS-R 12.2:** The JPSS RRPS system shall comply with OSPO development security check list.

  » OSPO development security check list is part of the OSPO Code Review Security check lists.
Basic Requirement 12.0

- **JPSS-RRPS-R 12.3**: The JPSS RRPS system shall comply with OSPO code check list.

  » OSPO code check list is part of the OSPO Code Review Security check lists.
Basic Requirement 13.0

- **JPSS-RRPS-R 13.0**: The JPSS RRPS developers shall specify IT resource needs for operations.

  » **Driver**: OSPO IT Capacity Planning
Basic Requirement 13.0

- **JPSS-RRPS-R 13.1**: The JPSS RRPS system shall run on Redhat Linux.
  » Servers are available.

- **JPSS-RRPS-R 10.2**: Operational server shall have 30 TB of disk space.
  » Available servers have this capability.

- **JPSS-RRPS-R 13.3**: Each operational server shall have 8 GB of RAM for each core.
  » Available servers have this capability.

The JPSS Risk Reduction System Requirements have been established.

The Requirements have been documented in the Requirements Allocation Document (RAD).

The Requirements are traceable to drivers (customer needs or expectations) and other requirements.
Outline

- Introduction
- Requirements
- Operations Concept
- Snow Cover
- Ice Cover and Concentration
- Ice Surface Temperature
- Ice Thickness/Age
- Software Architecture and Interfaces
- Detailed Design

- Quality Assurance
- Risks and Actions Summary
- Summary and Conclusions
Operations Concept

Presented by

A. K. Sharma
Identify intentions of the customers/users of the products

- Identify the SPSRB user requests
  - 1107-0011: Gridded Cloud Products for NWP Verification
  - 0909-0018: CLAVR-x and GSIP cloud product composites over Alaska
  - 0507-05: Polar/Geostationary Volcanic Ash Detection and Height on CLAVR-X
  - 1009-0016: Dust Aerosol Concentration Product
  - 0707-0014: Support satellite-based verification of the National Air Quality Forecast Capability
  - 0403-1: CrIS/ATMS Products for NWS

- Interact with the customers/users to produce an initial algorithm/system design that is consistent with their concept of operations
Operations Concept - Overview

- Review the answers to the following questions based on customer/user needs and expectations and production constraints
  - What is the product?
  - Why is this product being produced?
  - How will this product be used?
  - How should this product be produced (operational scenario)?

- The operations concept will be refined by the JPSS Risk Reduction Product Team (IPT), in consultation with customers/users, as the product solution and design are matured through the design development phase.
What is the Product?

- Cloud Mask
- Cloud Top Phase
- Cloud Type
- Cloud Top Height
- Cloud Cover Layers
- Cloud Top Temperature
- Cloud Top Pressure
- Cloud Optical Depth
- Cloud Particle Size Distribution
- Cloud Liquid Water
- Cloud Ice Water Path
What is the Product?

- Aerosol Detection
- Aerosol Optical Depth
- Aerosol Particle Size
- Volcanic Ash Mass Loading
- Volcanic Ash Height
What is the Product?

- Snow Cover
- Ice Concentration
- Ice Age
- Ice Surface Temperature

Why Are The Products Being Produced?

• NWS requests continuity of NOAA products between current and future NOAA operational satellites

• Demonstration of cost effective processing for NOAA JPSS products

• Demonstration of NOAA’s goal of enterprise solutions by employing same algorithms for “POES” and “GOES”

• Supports NWS OS&T implementation strategy of multi-sensor algorithms and products
How Will The Products Be Used?

- Gridded Cloud Products for NWP Verification
- CLAVR-x and GSIP cloud product composites over Alaska
- Polar/Geostationary Volcanic Ash Detection and Height on CLAVR-X
- Dust Aerosol Concentration Product
- Support satellite-based verification of the National Air Quality Forecast Capability
- CrIS/ATMS Products for NWS
How Should The Products Be Produced?

- Input Data Includes: NCEP/ECMWF forecasts, IMS
- Ancillary Data: Land Mask, Coast Mask, Desert Mask, Snow/Ice Mask, Digital Elevation Mask, NWP TPW, NWP Ozone, Surface pressure from NCEP forecast, Seebor Surface Emissivity, Surface Type, Surface Reflectance
How Should The Products Be Produced? Cont.

- There will be four distinct environments
  - Development Environment (STAR)
    - Development and testing of pre-operational codes on Redhat Linux OS
  - SADIE Development Environment (NDE)
    - Transition point for the Algorithm Package. Testing of Algorithm Package on Redhat Linux OS
  - Test environment (OSPO)
    - Pre-operational codes and documents (DAP) received from STAR will be implemented and tested on the designated Red Hat Linux machine by NDE and modified as needed before it is promoted to operation
  - Operation Environment (OSPO)
    - Operational DAP will be run on the designated Redhat Linux machine at ESPC and the products monitoring GUI will be posted on the intranet web server and accessed under ESPC VPN by the operators, PALS and maintenance programmers. Products will be distributed via NDE first, and then the PDA and OSPO ftp/http servers when PDA is available.
• Production and Delivery Scenarios
  » The ESPC Ingest Systems will handle all input satellite data and ancillary data
  » The JPSS RR product system will collect the satellite inputs and required ancillary data to run the OMPS LP algorithms
  » The product will be generated in NetCDF4
  » The JPSS RR metadata will be available for the Product Monitoring Tool system to use
  » The product users will be granted access to the ESPC distribution system (PDA, when available) through the data access request submission process.
  » Prior to PDA availability, NDE will distribute the JPSS RR products.
  » When PDA is available, ESPC will handle the distribution of JPSS RR products.
# Development and Operational System Environments

### Platform(s) and need dates

- **Research**: Linux (RHEL OS on x86-64 platform) with 12 CPUs (dual core) and 48 GB of memory. Dates: August 2013.
- **Production**: Linux (RHEL OS on x86-64 platform) with 6 CPUs (quad core) and 48 GB of memory. Dates: August 2013. (Purchased by NDE)

### Operating Systems

- **Research**: Linux (RHEL OS on x86-64 platform)
- **Production**: Linux (RHEL OS on x86-64 platform)

### Programming languages/compilers ***

- **Research**: Intel Compiler (C/C++/Fortran)
- **Production**: Intel Compiler (C/C++/Fortran) libraries

### Scripting languages

- **Research**: Perl (version 5.8 or higher)
- **Production**: Perl (version 5.8 or higher)

### Graphical/Imaging programs, COTS S/W, other tools, libraries, etc

- **Research**: IDL (version 7.0 or higher)
- **Production**: IDL (version 7.0 or higher)

### Helpdesk Monitoring Tool (standardized tool or customized tool?)

- **Research**: None
- **Production**: NPP Product Monitoring Tool (PSDI project)

### Other platforms needed for monitoring/imaging/graphics (specify platform & operating system)

- **Research**: None
- **Production**: None

### Other (tools, shareware, libraries, critical non-static ancillary data, etc)

- **Research**: Libraries: netCDF 4.0, HDF5, and BUFR Utilities: wgrib2
- **Production**: Libraries: netCDF 4.0, HDF5, and BUFR Utilities: wgrib2

Development and Operational System Maintenance Resources

- Walter Wolf, Andy Heidinger, Jeff Key, Shobha Kondragunta, Istvan Laszlo, Mike Pavolonis (STAR) and Peter Romanov (CREST) – Development Readiness and Quality Control support

- Shanna Sampson, Xingpin Liu (STAR), William Straka III, Ray Garcia (CIMSS) – Development support

- A. K. Sharma, Gilberto Vicente, Hanjun Ding, Zhaohui Cheng (OSPO), NIC – Operational Readiness and Quality control support
Distribution Environment – Capabilities and Resources

• NDE Data Distribution System

• Personnel
  » NDE Personnel
  » STAR Personnel
  » OSPO Personnel
Production Scenarios – Monitoring and Maintenance

• NDE, working with OSPO, will provide the system monitoring capability

• OSPO will provide the routine validation capability

• OSPO PAL, STAR, and NIC will perform routine validation of the VIIRS Risk Reduction products
Production Scenarios – Monitoring and Maintenance – cont.

- Production Monitoring and Maintenance Scenarios
  - The PAL and maintenance personnel at OSPO will monitor the system’s function and resolve the issues.
  - The maintenance personnel at OSPO will maintain and back up the database.
  - STAR personnel are available for operational science issues.
  - The JPSS Risk Reduction product files will have variables available for product monitoring.
The VIIRS Risk Reduction System Requirements have been established.

The Requirements have been documented in the Requirements Allocation Document (RAD).

The Requirements are traceable to drivers (customer needs or expectations) and other requirements.
The VIIRS Risk Reduction products will not be archived to CLASS / NCDC archive.
User Interaction

- The ESPC help desk will serve as the operational point of contact to provide 24/7 service support for users
  - Provides information about the VIIRS RR data products to the user community
  - Resolves user issues through coordination with the associated PALs
- The PALs will coordinate further with the STAR scientists for any product quality issue when identified and communicate with users.
The OSPO Ingest Systems will handle all input satellite data and ancillary data.

OSPO will run the VIIRS RR system.

OPSO PAL, STAR team and NIC team will perform product validation.

NCEP will use the associated products within their models and will provide the support for products testing and validation.

VIIRS RR products will be available to be sent to the Reformatting Toolkit project, the Product Monitoring project and CLASS.

Algorithm Theoretical Basis

Snow Cover

Presented by

Peter Romanov
Purpose: Provide reviewers and users with a theoretical description (scientific and mathematical) of the NPP-Suomi VIIRS Snow Cover algorithm

Will be documented in the ATBD of NPP-Suomi VIIRS Snow Cover Product
# Requirements

## Snow Cover

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Accurate, spatially detailed and timely information on the snow cover is needed in NWP, hydrological and climate models. VIIRS snow cover retrievals also play a critical role in the NOAA Unique VIIRS data processing system since many algorithms require information on the snow cover to derive other land surface and atmospheric parameters (aerosol and clouds).
Algorithm Objectives

- Meet the requirements for the snow cover EDR
- Provide quality indicators to snow cover products.
- Provide needed performance information
- Be computationally efficient
NOAA Unique VIIRS Snow Cover Algorithm

- Description: Discriminates between snow-covered and snow-free land scenes. Uses decision-tree threshold-based approach to classify satellite images. Performs additional tests (spatial consistency, climatology) to identify spurious snow.

- Heritage:
  - NASA MODIS and NPP VIIRS algorithm – D. Hall, 2003, RSE
  - NOAA AVHRR algorithm – Romanov, 2012

- GOES Imager and NOAA AVHRR algorithms are currently implemented operationally at NESDIS OSDPD as part of the Global Multisensor Snow and Ice Mapping System (Autosnow)

| Current Input | Expected Added Input |
NPP-Suomi VIIRS Snow Cover product requires for each pixel:

- VIIRS-observed calibrated surface reflectance and brightness temperature data
- Observation geometry (satellite zenith, solar zenith and relative azimuth angles)
- Geolocation (latitude, longitude)
- VIIRS SDR and cloud mask processing information (quality flags)

<table>

Two types of ancillary data needed:

**VIIRS Data:**
- Cloud mask (including cloud shadow flag if available)
- SDR quality flags

**Non-VIIRS Static Data:**
- Land/water mask
- Surface elevation
- Snow cover climatology
- Land surface temperature climatology (ISCCP)
- Algorithm control parameters (threshold values)

Visible /Near-Infrared/SWIR/IR, Justifications for Use:

- **Vis (I1, 0.64um) and SWIR (I3, 1.61um)**
  - Large difference between the scene reflectance in the visible and shortwave infrared spectral bands is the primary indicator of the presence of snow

- **Near-IR (I2, 0.86um)**
  - Helps to identify snow partially masked by vegetation (forest), used to calculate NDVI

- **IR (I5, 11.4um)**
  - Helps to discriminate snow cover from other land surfaces that “look” similar to snow in reflective bands but are typically warmer than snow (e.g., sand, salt)
Physical Description; Channel Choice (2/2)

- Mid-IR (I4, 3.7μm)
  
  » Justifications for Use:
    - May improve discrimination of snow from land surface types that exhibit a spectral response similar to snow in VIRS other reflective bands (e.g., sand, dry salt lakes)
    - This is an additional band inclusion
Snow has a specific spectral reflectance pattern: Snow reflectance drops from very high values in the visible and near-infrared to very low values in the shortwave and mid-infrared spectral range. This spectral pattern is different from spectral reflectance of most other natural land surface cover types.

However there is number of factors that complicate identification of snow in satellite imagery ....
Snow reflectance depends on physical properties of snow (e.g., grain size, impurities, forest litter)
Physical Description
Snow Reflectance (3/4)

Snow reflectance varies with the viewing and illumination geometry of observations.

Snow reflectance is larger in the forward scatter direction.
Reflectance of snow-covered land surface changes when snow is shadowed or masked by tree canopy

From Vikhamar & Solberg (2003)
IR brightness temperature of snow covered land scenes is typically low (below 273 K). However it may reach 285K and even higher values when the snow cover is not continuous or is masked by vegetation.

METOP AVHRR IR brightness temperature of snow covered land
Clouds are the major factor hampering snow cover identification in satellite imagery.

No cloud detection algorithm is perfect. Some clouds are always missed and some clear sky scenes are classified as “cloudy.”

Missed clouds are often interpreted as “snow” by the snow algorithm causing spurious snow cover in the snow product.
Approach to Snow Mapping with VIIRS Data

- Use daytime imagery. Accurate snow identification is not possible without the use of reflective bands data.

- Assume that the cloud detection algorithm is run prior to the snow algorithm. Therefore no general cloud identification procedure is needed.

- Perform preliminary identification of snow cover using spectral-based tests using VIIRS bands.

- Apply additional filters to identify spurious snow that may have occurred to the cloud mask leak. Use both VIIRS data and auxiliary information.
Current VIIRS Snow Cover Algorithm

- Decision-tree, threshold-based algorithm
- Almost identical to MODIS
- Applied to cloud clear land pixels (uses external cloud mask)
- Requires daytime observation conditions
- Uses
  Reflectance in VIIRS bands I1 (R₁), I2 (R₂), I3 (R₃)
  Brightness temperature in VIIRS band I5 (T₅)
- Calculates
  NDSI= (R₁-R₃)/(R₁+R₃) : Norm. Dif. Snow Index
  NDVI= (R₂-R₁)/(R₂+R₁) : Norm. Dif. Vegetation Index
Pixel is identified as snow-covered if

1. \( T_5 < 283K \)
   and
2. \( \text{NDSI} > 0.4 \)
   or
   \( 0.1 < \text{NDSI} < 0.4 \)
   and
   NDSI/NDVI values fit into the additional “snow” region

Additional “snow” region is defined as

\[
\text{NDVI} = a_1 + a_2 \times \text{NDSI}
\]

\[
\text{NDVI} = b + b_2 \times \text{NDSI} + b_3 \times \text{NDSI}^2 + b_4 \times \text{NDSI}^3
\]

: lower NDVI threshold

: upper NDVI threshold

from Klein et al, 1998
Current VIIRS Snow Cover Product

VIIRS snow cover, February 9, 2013

- snow
- land
- cloud
- No data / not processed
Current VIIRS Snow Cover Product Accuracy

Snow cover mapped in the current VIIRS snow product qualitatively agrees well to the snow cover mapped by human analysts within NOAA IMS system.
The current accuracy of VIIRS snow cover product is over 95% as compared to IMS snow maps. This high accuracy of the VIIRS snow product is partially due to a very conservative VIIRS cloud mask: The fraction of confidently cloud clear pixels in the VIIRS snow product is about 30% compared to 40% fraction of clear pixels in the MODIS snow product.
Conservatism of the cloud mask results in the cloud clear snow cover scenes frequently labeled as cloudy.

Clear sky, snow cover, interpreted as mostly cloudy area in the VIIRS snow product.
NDVI/NDSI in dense snow covered forests may fall beyond the VIIRS NDVI/NDSI snow test threshold values. As a result snow cover is missed.
Current VIIRS Snow Cover
Other Issues (2/4)

The algorithm frequently misses snow in the mountains.

Reason: too low temperature threshold ($T_5 < 283$K)

Yellow: Mapped snow with $T < 283$ K

A higher temperature threshold value for snow-covered scenes should be used.
Missed clouds are most often interpreted as snow and appear in the snow product as spurious snow.

The extent of spurious snow cover is small compared to the true snow. However these errors tend to accumulate in the VIIRS clear sky snow/ice composited images and affect other VIIRS products that rely on them (e.g., LST, NDVI, Albedo, etc).
Occasional failures to detect snow shadowed by clouds.

Cloud shadow mask may help
The current algorithm generally performs well but may be improved

Modifications to the algorithm are focused primarily at
- Snow misses in dense forests
- Misses of patchy snow cover (particularly in the mountains)
- False snow due to cloud misses

Modifications include
- Improved spectral-based snow identification tests
- Added consistency tests
  - Consistency with climatic information
  - Analysis of the spatial pattern of derived snow cover
VIIRS Snow Cover algorithm includes the following steps:

1. Read input data
2. Identify snow covered pixels based on the analysis of the scene’s spectral response
3. Identify “spurious snow” : examine pixels labeled as “snow” at the first step for possible misclassifications of clouds as snow.
4. Save output data
Mathematical Basis
Pixel-based processing

Retrieval algorithm

Read input data
Pixel-by-pixel snow detection
Consistency testing, filtering
Write out results

Loop Through Pixels

If water (not land)
If cloud obscured or cloud shadow
If insufficient illumination
Apply spectral tests

End Loop Through Pixels

Preliminary Output Data
Snow Cover Map (Granule)
Quality flags
Mathematical Basis
Spectral Tests

Pixel is identified as “potential snow” if

1. $T_5 < T_{5T}$ (“cold scene” test)
   and
2. $R_1 > R_{1T}$ (“bright scene” test)
   and
3. $R_3 > R_{3T}$ (“dark SWIR scene” test)
   and
4. $\text{NDSI} > \text{NDSI}_T$ (NDVI) (“snow” test)

$\text{NDSI}_T$ (NDVI) is defined as a 5 point broken line separating “snow” and “no snow” regions in the NDSI - NDVI feature space

$T_{5T}$, $R_{1T}$, $R_{3T}$ and $\text{NDSI}_T$ (NDVI) point coordinates are tunable parameters
Current VIIRS algorithm

New VIIRS algorithm

Change of the NDVI/NDSI test configuration should improve snow detection in forested regions and delineation of patchy snow cover in the plains.
The $T_5$ threshold is set to 290K to better reproduce snow cover in the mountains. The same value is used in the METOP AVHRR operational snow mapping system.
Mathematical Basis
“Bright Vis” and “Dark SWIR” Test

Snow-covered forest:

\[ R_1 > 0.1 \text{  } \&\text{  } R_3 < 0.25 \]

Other types of snow covered land surfaces exhibit larger \( R_1 \) and smaller \( R_3 \) reflectance.
Mathematical Basis
“Bright Vis” and “Dark SWIR” Test

Snow covered grassy plain area: \( R_1 > 0.1 \) & \( R_3 < 0.25 \) also work well
Analysis of the current VIIRS snow product has not revealed any strong effects of varying viewing-illumination geometry on the accuracy of snow retrievals.

Therefore in the current version of the new VIIRS snow algorithm angular correction of reflectance-based threshold values has not been assumed.
1. **Snow Cover Climatology Test**
   - Checks whether detected snow is climatically possible

2. **Surface Temperature Climatology Test**
   - Checks whether the brightness temperature of the “potential snow” pixel is consistent with the LST climatology

3. **Spatial Consistency Test**
   - Identifies individual “potential snow” pixels or small clusters of “potential snow” pixels inside extensive areas of continuous cloudiness

4. **Surface Temperature Spatial Uniformity Test**
   - Checks whether the spatial gradient of the temperature of pixels identified as “cloud clear” is realistic

Switches turning all tests on and off are tunable parameters

All tests have been implemented and are used with METOP AVHRR data within NESDIS Multisensor Snow and Ice Mapping System
Mathematical Basis
Snow Cover Climatology

- Derived from NOAA interactive snow charts for the period 1972-1998
- Defined on a weekly basis, covers Northern Hemisphere
- Resampled to lat-lon grid, 1/3° grid cell size (~30 km)

Weekly snow frequency of occurrence

Weekly snow occurrence categories of “persistent snow”, “snow possible” and “snow unlikely”
Test:
- Identify “potential snow” pixels within “snow unlikely” region
- Exclude elevated areas (H > $H_T$)
- Label all remaining “potential snow” pixels as “unconfirmed snow”
- Modify pixels’ QC flags accordingly

$H_T$ is a tunable threshold parameter (current value is 1000m)
The test is intended to identify false snow which occurred due to the cloud mask leakage.
Mathematical Basis
LST Climatology

- Provided by ISCCP (ftp://isccp.giss.nasa.gov/pub/data/surface/)
- Defined on a monthly basis, covers the globe
- Defined on a lat-lon grid, 5° grid cell size

ISCCP mean land surface (skin) temperature for the month of July
Test:

- Test compares $T_5$ with the multiyear mean value of the daytime land surface temperature ($T_{\text{clim}_{\text{LST}}}$) for the pixel location.
- If $T_5 < T_{\text{clim}_{\text{LST}}} - D T_T$, “snow” is rejected and the pixel is labeled “unconfirmed snow”.
- $D T_T$ is a tunable parameter. The current value is 20K.
- $D T_T$ is corrected for the surface elevation assuming 8K/km vertical temperature gradient.
Mathematical Basis
Spatial Consistency Issue

- Small clusters of “potential snow” pixels inside extensive areas of continuous cloudiness are often “false” snow resulting from the cloud mask leak.

VIIRS/IMS Overlay, January 19, 2013

VIIRS snow map errors:
- Omission
- Commission

False snow in the VIIRS snow map (blue)
- Moving window of $N \times N$ pixels is used to identify isolated small clusters of "potential snow" pixels fully enclosed by cloudy pixels.

- If the fraction of clear pixels is less than $\text{FC}(\%)$, pixels identified as "potential snow" are labeled as "unconfirmed snow”

- $N$ and $\text{FC}$ are tunable parameters. At this time $N=21$ and $\text{FC}=10\%$
Mathematical Basis
LST Spatial Uniformity Test

- Assumes LST max spatial gradient of ~10K/km.
- Checks each “potential snow” pixel and looks for much warmer pixels (dT) in the close proximity (within 51 x 51 grid cell area)
- If more than FW(%) of checked pixels are much warmer than the “potential snow” pixels, the latter is labeled as “unconfirmed snow”
- The test is not applied in high altitude areas (H < 500 m)
- dT and FW are tunable parameters. Current values are 20K and 5% respectively.
- This is a planned improvement
• Output data
  » Snow cover map
  » Quality flags

Proposed snow map coding: mostly follows MODIS snow product coding

255  Fill Data (no VIIRS coverage)
254  Bad or missing VIIRS sensor data
200  Snow
50   Cloud, no retrieval
39   Water
25   Snow-free land
11   Dark (insufficient daylight)
  2   Unconfirmed snow (did not pass any of consistency tests)
  1   Undetermined

Including water, cloud and other masks in the snow map makes it easier to apply and hence more attractive to potential user
Algorithm Summary

- Spectral threshold-based snow identification followed by consistency testing of identified snow
- Slightly modified spectral thresholds (as compared to current VIIRS and MODIS) to better identify and map patchy snow cover
- Consistency testing: attempt to identify “false snow” using auxiliary information
  - Verification against snow cover climatology (NH only)
  - Verification against land surface temperature climatology
The VIIRS snow cover algorithm is affected by the following practical consideration:

- Computational considerations
- Cloud masking considerations
- Constraints
Practical Considerations

- Computational Considerations

- The threshold-based tests do not require substantial computational resources. Spatial consistency tests are more time consuming.

- Spatial consistency tests may be modified to incorporate smaller area in the sliding window. This will cut the CPU time but may reduce the efficiency of the tests.
Practical Considerations

• Cloud Mask
  » Accurate cloud masking is critical for snow retrievals. Missed clouds may show up in the product as spurious snow cover.
  » Too conservative cloud masking improves the accuracy of snow/no snow discrimination, but increases cloud gaps in the product and hence reduces its value.
  » Particular algorithm threshold values should be tuned after the cloud mask is finalized.

• Land/water mask
  » Current VIIRS land/water mask needs improvement. Better land/water mask will help to better characterize small-scale features in the snow cover distribution and snow cover in the coastal region.
Practical Considerations

- **Constraints**
  - Proper snow identification is impossible
    - When clouds obscure the view
    - At night and at low solar elevation angles
Testing and Validation: Snow Cover Climatology Test

Snow climatology test
- Applied outside of mountainous areas (h<1 km)
- Identifies at least part of “false snow” which occurs due to the cloud mask leak
Testing and Validation: Temperature Climatology Test

Surface temperature climatology test
- Identifies at least part of “false snow” which occurs due to the cloud mask leak

Climatic LST is ~294K
$T_5$ threshold value is set to 274K

False snow?

VIIRS snow map

VIIRS T5 (K)

“Snow” pixels $T_5$ frequency distribution

Threshold value

Pink: Snow rejected by surface temperature climatology test
Detailed testing and validation of the snow algorithm has been performed with METOP AVHRR data in 2012-2013.

- In the Northern Hemisphere snow and ice is derived from METOP AVHRR data in the region above 25°N.
- Clouds and ice are mapped using a different (not VIIRS) algorithm.
Testing and Validation

Snow and ice in Antarctic

METOP AVHRR RGB false color image
Testing and Validation

Snow in South America

RGB false color image

Snow map

- Snow
- Ice
- No snow
- Cloud
Testing and Validation

- Good qualitative agreement between the two products.

METOP AVHRR snow map with IMS snow cover overlaid

- Snow, both METOP and IMS
- No snow, both METOP and IMS
- Cloud METOP
- Snow miss METOP
- False snow METOP
Testing and Validation

METOP snow agreement to IMS snow, Northern Hemisphere 2012-2013

METOP-IMS agreement on the snow cover distribution ranges within 96-99%
Testing and Validation

METOP snow agreement to IMS snow, Eurasia and North America
2012-2013

METOP-IMS agreement on the snow cover distribution ranges within 94-99%
Testing and Validation

METOP snow agreement to surface snow observations

Validation is limited to the CONUS region only since most WMO stations do not report "zero" snow depth.

Agreement ranges within 90-95% during winter months.

Feb 19, 2013
Snow identification has been developed for VIIRS

The algorithm includes a two-stage approach, the threshold-based spectral snow detection and consistency testing of snow retrievals

Algorithm testing and validation has been performed mostly with METOP AVHRR data. METOP retrievals were compared with

- IMS charts
- Surface observation data

Consistency checks have been tested with VIIRS data and demonstrated good performance

Retrieval accuracy is within specifications

- Above 95% as compared to IMS
- Above 90% as compared to in situ measurements
Snow Cover
Exception Handling

- Unavailable/bad input radiance data
  » Pixel is labeled as “missing data”
  » Processing of the granule continues

- Insufficient daylight conditions (SZA > 85°)
  » Pixel is labeled as “dark”
  » Processing of the granule continues

- Any of the required ancillary data file is not available
  » All pixels in current the granule are flagged as “undetermined”
  » Switch to processing of the next product
Snow Cover: Assumptions

- Assumptions
  - VIIRS observation data are within specifications
  - All ancillary static datasets are accurate
  - Snow is not extremely littered
  - Cloud mask accuracy is the same as the accuracy of the current VIIRS operational cloud mask
Snow Cover: Limitations

- Limitations
  - No retrievals in cloudy conditions and at night
  - Reduced performance of the algorithm should be expected at large solar zenith angles, over dense forests and rugged terrain
  - Scenes with small fractional snow cover on the ground may be interpreted as “snow-free”
  - Dry salt lakes at cold temperatures may be interpreted as snow cover
Snow Cover: Other Considerations

- Overall accuracy of the snow product depends on the accuracy and conservatism of the cloud mask. More conservative cloud mask → More pixels with intermittent snow cover are attributed to clouds → Better accuracy, but decreased effective coverage → Delay in detection of changes in the snow cover.

- Accurate land/water mask is needed to properly reproduce the snow cover distribution and accurately assess the snow extent. Current VIIRS operational land/water mask has problems.

- Accurate navigation and geographical registration of satellite data along with high accuracy of the surface elevation dataset is critical for mapping snow in the mountains.
Snow Cover: Preplanned Product Improvements

- Improvement of the snow cover climatology: incorporate 1998-2012 data, increase spatial resolution
- Tuning threshold values and other parameters controlling snow detection
- Implementing additional consistency tests (surface temperature gradient test)
- Incorporation of observation geometry-dependent threshold values (e.g., NDVI/NDSI, R1)
- Use of VIIRS 3.7 µm band data
- Adding snow fraction retrievals
  - Based on the VIIRS ch. 1 reflectance (Romanov et al, 2003)
  - Linear mixture approach
Snow Cover Risk

- **Risk 1** Algorithm has been developed and tested with the current VIIRS operational cloud mask. Algorithm will need tuning when the NOAA unique cloud mask is used

- **Risk Assessment:** Medium

- **Impact:**
  - Inaccurate cloud mask may lead to the snow cover not meeting requirements

- **Mitigation:**
  - Start testing and evaluating the new cloud mask as soon as it is available

- **Status:** Open

Preferred Solution

- **Daytime** (solar zenith angle less than 85 degree)
  - Combination of MODIS sea ice mapping algorithm and NPP/VIIRS ice algorithm
  - This algorithm updates the tests of the MODIS sea ice mapping algorithm, and uses the ice concentration retrieval results to further refine the ice mask.

- **Nighttime** (solar zenith angle larger than 85 degree)
  - Combination of ice surface temperature algorithm and NPP/VIIRS fresh water ice algorithm; further refines the ice extent from ice concentration.

- Designed for easy portability and adaptation
- Applicable to all water surface conditions
- Algorithm simple and fast
- For both day and night
- Consistent with the ABI algorithm
Ice Concentration and Ice Cover
Algorithm Objectives

- The JPSS VIIRS Ice Concentration and Ice Mask Product will be produced for each VIIRS image and will provide ice mask, and ice concentration over all water surfaces of the globe.

- The primary output consists of a map of ice concentration, ice mask, and corresponding quality control flags.

- Applications of ice mask and ice concentration include numerical weather prediction and data assimilation, hydrological modeling, climate modeling, transportation, recreation.

Ice Concentration and Cover Algorithm Input and Output

- JPSS VIIRS Ice concentration and mask Algorithm requires for each pixel:
  - Calibrated/Navigated VIIRS reflectance and brightness temperatures
  - Solar zenith angle and satellite viewing angle
  - Cloud mask and land mask
  - Longitude and Latitude
  - Imagery can be in native satellite projection or remapped projection

Ice Concentration and Cover Algorithm Description

- Procedures of ice concentration and cover algorithm

1. Use threshold tests to detect possible ice cover: Daytime and Nighttime

2. Use a tie-point algorithm to derive reflectance (temperature) for pure ice pixel, and then calculate ice concentration
   - Reflectance (temperature) of pure ice and pure water are tied to points in a frequency histogram, and the ice fraction in a pixel (ice concentration) is determined by linearly interpolating between these tie points

3. Ice pixels with retrieved ice concentration larger than 15% are identified as ice. Ice pixels with retrieved ice concentration smaller than 15% are not identified as ice
Ice Concentration and Cover Algorithm Processing Outline

High Level Flowchart of the ice concentration and cover algorithm

1. **step1**
   - Group-criteria detection

2. **step2**
   - Tie point algorithm
     - Ice concentration
       - Ice cover

3. **step3**
   - Ice concentration and cover algorithm begin
     - VIIRS channel radiance, satellite viewing angles, cloud mask, land/water mask
     - Ice concentration and cover algorithm end
Ice Concentration and Cover Algorithm Description

Step 1: Use threshold tests to detect possible ice cover

- **Daytime**
  - Normalized Difference Snow Index (NDSI) is the key index used to detect ice cover in sunlit conditions (“daytime”).
  - Reflectance at near infrared channel is another parameter considered.
Top of the atmosphere NDSI is defined as

\[ \text{NDSI} = \frac{R_{\text{vis}} - R_{\text{swir}}}{R_{\text{vis}} + R_{\text{swir}}} \]

- \( R_{\text{vis}} \) = visible (or near infrared) channel reflectance
- \( R_{\text{swir}} \) = short-wave infrared channel reflectance

Retrievals require
- Clear-sky conditions
- Enough daylight
Ice Concentration and Cover Algorithm Description

Reflectance means for samples of ice, clouds, and water (Riggs et al. 1999).

NDSI value:
- Water:  ~ 0.5
- New ice: ~ 1.0
- Snow ice: ~ 1.0
- Cloud:   ~ 0.0

Snow reflectance shows very high values at visible channels, but low values at short-wavelength channels longer than 1.4 microns. Clouds have high reflectance at both visible and near infrared channels. Water surface is dark at almost all wavelengths.
Ice Concentration and Cover Algorithm Description

- Pixels with both NDSI and reflectance larger than set thresholds is ice.

- Reflectance at near infrared channel, 0.865 µm
  - Threshold 0.08

- These thresholds are derived based on observed data, not directly derived from figure in the previous slide.
Ice Concentration and Cover Algorithm Description

Step 1: Use threshold tests to detect possible ice cover

- **Nighttime**
  - A pixel is identified as ice if the surface skin temperature is less than a threshold
  - Threshold 273.1 K
Ice/snow surface temperature is retrieved by the following equation (Key et al. 1997).

\[ Ts = a + b \ T11 + cT12 + d \ [(T11-T12)(\sec \theta -1)] \]

\( Ts \) = the estimated surface temperature (K)
\( T11 \) = the brightness temperatures (K) at 11 um
\( T12 \) = the brightness temperatures (K) at 12 um
\( \theta \) = sensor scan angle

\( a, b, c, d \) = coefficients, derived for the following temperature ranges:
\( T11 < 240K, 240K < T11 < 260K, T11 > 260K. \)
Ice Concentration and Cover Algorithm Description

Step 2a: Use tie point algorithm to calculate ice concentration

- The first step of tie point algorithm: determine reflectance (temperature) of pure ice in a search window.
  - In a 50 pixel by 50 pixel search window in JPSS VIIRS imager, there is only one predominant ice type.
  - The reflectance (temperature) of a pixel in this search window increases linearly with the increasing ice fraction.
  - In this search window covered by ice and water, pure ice pixels exist; the reflectance (temperature) of these pure ice pixels is determined.
In a search window, the reflectance (temperature) of pure ice is determined as the reflectance (temperature) with the maximum relative frequency.

Figure: Reflectance probability density distribution at 0.64 µm for ice cover over Lake Erie on Feb 24th, 2008 (left), and over Barents and Kara Seas on Mar 31st, 2008 (right). The ice tie points (0.6, 0.65) are indicated by the peaks in both plots.
Step 2b: Use tie point algorithm to calculate ice concentration

- The second step of tie point algorithm: calculate ice concentration for each pixel in a search window
  - Use visible reflectance at JPSS VIIRS Band M5 (I2) (0.64 μm) at daytime and derived surface skin temperature at nighttime. Reflectance at 0.64 μm is less sensitive to aerosols compared to other shorter wavelengths.
  - Window size is 50 pixel by 50 pixel.
  - Reflectance at JPSS VIIRS Band M5 (I2) (temperature) of pure water pixels is set to 0.05 (273.1 K), where water has a reflectance below that value.
Fractional ice concentration for each pixel ($F_p$) in a search window is then calculated as

$$F_p = \frac{(B_p - B_{\text{water}})}{(B_{\text{ice}} - B_{\text{water}})}$$

- $B_{\text{water}}$ = the reflectance/temperature (K) of a pure water pixel
- $B_{\text{ice}}$ = the reflectance/temperature (K) of a pure ice pixel
- $B_p$ = the observed reflectance/temperature (K) of the pixel.

- In this algorithm, reflectance at JPSS VIIRS Band M5 (I2) (0.64 \( \mu \text{m} \)) is selected in daytime, and surface temperature is selected in nighttime.
- The spatial resolution is 0.75 (0.375) km at 0.64 \( \mu \text{m} \) channel, and 0.75 km for surface temperature at sub-satellite FOV.
Step 3:

For final ice cover product:

- Ice pixels with retrieved ice concentration larger than 15% are identified as ice.
- Ice pixels with retrieved ice concentration smaller than 15% are not identified as ice.
Summary of Ice Concentration and Cover Algorithm

- Use threshold tests to detect possible ice cover in both daytime and nighttime.
- Use tie-point algorithm to determine pure ice reflectance and temperature; and calculate the ice concentration.
- Use the retrieved the ice concentration to refine the final ice extent.
- This algorithm is easily implementable, and effective.
- Suitable for routine processing of large image archives.
- Works in both daytime and nighttime.
Ice Concentration and Cover Practical Considerations

• Numerical Computation Considerations
This ice concentration and extent algorithm is implemented sequentially. The computation time is very economic.

• Programming and Procedural Considerations
This ice concentration and extent algorithm requires spatial information distributions in a search window. Temporal information is not necessary.
• Quality Assessment and Diagnostics

The following procedures are recommended for diagnosing the performance of this algorithm.

- Monitor the products with other products using different satellite input, and real time in-situ observations.
- Check input data, surface skin temperature, and reflectance for all pixels.
- Periodically image the individual test results to look for artifacts or non-physical behaviors.
- Maintain a close collaboration with the other teams using the output of this algorithm in their product generation.

• Exception Handling

This algorithm includes checking the validity of input data before running. This algorithm also checks for missing input variables values.
Ice Concentration and Cover Algorithm Verification

- **Truth Measurements and other products**
  - **Truth**
    - AMSR-E/Aqua Daily L3 12.5 km Sea Ice Concentration (pixel averaging of ABI ice fraction is needed because AMSR-E is lower resolution)
    - Ice chart from National Ice Center and Canadian Ice Service with 0.25 degree resolution (pixel averaging of ABI ice fraction is needed because AMSR-E is lower resolution)
  - **Verification (qualitative)**
    - MODIS true color imagery
Sea ice concentration (SIC) (%) retrieved from (a) MODIS Sea Ice Temperature (SIT), (b) MODIS visible band reflectance, and (c) from Advanced Microwave Scanning Radiometer - Earth Observing System (AMSR-E) Level-3 gridded daily mean from NSIDC on March 31, 2006.
Lake ice concentration (%) retrieved from (a) SEVIRI Surface Ice Temperature (SIT), (b) SEVIRI visible band reflectance (0.64 \( \mu \)m, and (c) satellite true color image over Caspian Sea on January 27th, 2006.
Lake ice concentration (%) with MODIS Aqua data (left), MODIS true color image (middle), and from AMSR-E (right) over Great Lakes on February 24, 2008.
Frequency distribution of ice concentration difference between AMSR-E sea ice concentration product and retrievals using this algorithm based on selected 20 clear day MODIS data from 2004 to 2008 in Great Lakes region.

Bias = -6.5%
Standard Deviation = 15.0%

Required accuracy: 10%
Frequency distribution of ice concentration difference between AMSR-E ice concentration product and retrievals using this algorithm based on selected 20 clear day MODIS data in 2007 over the Arctic Ocean.

Bias = 0.5%
Standard Deviation = 10.0%

Required accuracy: 10%
Ice Concentration and Cover Algorithm Performance Estimate

- Ice concentration retrievals meet the required accuracy 10%, in comparison with the AMSR-E product.
- Some tuning of the algorithm, including test threshold, and some constants, may be required.
- This algorithm works for any water surface, including lake, river, and ocean. More verification will be done over rivers.
- Quantitative validation of the product will be conducted by comparing the derived ice concentration and extent with ice chart product.
- Major risks are associated with
  - Inaccurate cloud identification
  - Inaccurate identification of cloud shadows
- **Sensor Performance**
  
  » All satellite channel calibration and navigation will be correct and uniform from image to image

  » Cloud mask eliminates all possible cloud contamination.

  » Land/sea mask is accurate

  » Changes of reflectance/temperature in each search window are mainly caused by difference in ice concentration.
• **Product improvements may result from these studies:**

  » Size of the search window will be tested to get the best results.
    - Current size of the search window is 50 pixel by 50 pixel

  » The tie point reflectance (temperature) is being evaluated to get the best result.

  » The instrument noise on the final retrieval results is being investigated.
Risk 2: Persistent cloud cover and false cloud detection in the polar regions

Risk Assessment: Medium

Impact:
- Persistent cloud cover and false cloud detection may lead to the ice concentration and cover failing to meet the requirements

Mitigation:
- Work closely with the cloud team to ensure accurate cloud classification
- Use alternate source of snow/ice information (GFS, IMS, Global Snow & Ice Mapping System) to flag persistent clouds

Status: Open
Ice Concentration and Cover Risk

- **Risk 3:** Lack of truth data for ice concentration and cover validation
- **Risk Assessment:** Medium
- **Impact:**
  - Without truth data, we may not know if the ice concentration and cover products meet the requirements
- **Mitigation:**
  - Work with the community to develop more truth data sites
- **Status:** Open

Ice Surface Temperature

Presented by

Yinghui Liu

UW-Madison CIMSS
The purpose of the JPSS VIIRS Ice Surface Temperature Algorithm ATBD is to provide programmers, reviewers and users with a theoretical description (scientific and mathematical) of this algorithm.

Information has been documented in the JPSS VIIRS ATBD.
## CDR Requirements

### Ice Surface Temperature

<table>

<td>Over specified geographic area</td>
<td></td>
</tr>
</tbody>
</table>
Ice Surface Temperature Algorithm Objectives

- The JPSS VIIRS Ice Surface Temperature Product will be produced for each VIIRS image and will provide values over all water surfaces of the globe.
- The primary output consists of a map of ice surface temperature, and corresponding quality control flags.
- Applications of ice surface temperature include numerical weather prediction and data assimilation, hydrological modeling, climate modeling, transportation, recreation.
### Instrument Characteristics

JPSS VIIRS Ice Surface Temperature Algorithm requires for each pixel:

- Calibrated/Navigated VIIRS brightness temperatures
- Satellite viewing angle
- Cloud mask and land mask
- Ice concentration and ice cover
- Longitude and Latitude
- Imagery can be in native satellite projection or remapped projection

• Procedures of ice surface temperature algorithm

1. Select pixels for IST retrieval: clear sky, ice pixels only. Daytime and nighttime.

2. Use a regression algorithm similar to the conventional split-window (infrared) sea surface temperature algorithms. IST is a simple calculation based on two channels with regression coefficients that are a function of temperature.
High Level Flowchart of the ice surface temperature algorithm

Ice surface temperature algorithm begin

VIIRS channel radiance, satellite viewing angles, cloud mask, land/water mask, ice concentration

step1

Group-criteria detection

Ice

step2

IST regression algorithm

Ice surface temperature

Ice surface temperature algorithm end
Ice/snow surface temperature is retrieved by the following equation (Key et al. 1997).

\[ Ts = a + b \ T11 + c \ T12 + d \ [ (T11 - T12)(\sec \theta - 1) ] \]

Ts = the estimated surface temperature (K)
T11 = the brightness temperatures (K) at 11 um
T12 = the brightness temperatures (K) at 12 um
\( \theta \) = sensor scan angle

a, b, c, d = coefficients, derived for the following temperature ranges:
T11 < 240K, 240K < T11 < 260K, T11 > 260K.
• **Numerical Computation Considerations**

This ice surface temperature algorithm is implemented sequentially. The computation time is very economic.
• **Quality Assessment and Diagnostics**

The following procedures are recommended for diagnosing the performance of this algorithm.

- Monitor the products with other products using different satellite input, and real time in-situ observations.
- Check input data for all pixels.
- Periodically image the individual test results to look for artifacts or non-physical behaviors.
- Maintain a close collaboration with the other teams using the output of this algorithm in their product generation.

• **Exception Handling**

This algorithm includes checking the validity of input data before running. This algorithm also checks for missing input variables values.
Ice Surface Temperature Algorithm Verification

- **Truth Measurements and other products**
  - **Truth**
  - In situ observations of ice surface temperature from field campaigns
  - Co-located ice surface temperature retrievals from MODIS
IST comparison along NASA P-3 flight track (March 2012) for one Ice Bridge flight. The operational VIIRS IST and MODIS IST are shown for comparison. Note that the IST algorithm to be used for this project is the MODIS algorithm with coefficients adapted to VIIRS (in progress), not the operational VIIRS algorithm.
Some tuning of the algorithm may be required

This algorithm works for any water surface, including lake, river, and ocean. More verification will be done over rivers.

Quantitative validation of the product will be conducted.

Major risks are associated with

» Inaccurate cloud identification
» Inaccurate identification of cloud shadows
Ice Surface Temperature Assumptions and Limitations

- **Sensor Performance**
  - All satellite channel calibration navigation will be correct and uniform from image to image
  - Cloud mask eliminates all possible cloud contamination
  - Land/Water mask is accurate
Ice Surface Temperature Risk

- **Risk 2:** Persistent cloud cover and false cloud detection in the polar regions
- **Risk Assessment:** Medium
- **Impact:**
  - Persistent cloud cover and false cloud detection may lead to the ice surface temperature failing to meet the requirements
- **Mitigation:**
  - Work closely with the cloud team to ensure accurate cloud classification
  - Use alternate source of snow/ice information (GFS, IMS, Global Snow & Ice Mapping System) to flag persistent clouds
- **Status:** Open

---
Ice Thickness and Age Algorithm Design

- One-dimensional Thermodynamic Ice Model (OTIM) algorithm design:
  - Solid physical foundation with all components of surface energy budget considered,
  - Capable of retrieving daytime and nighttime sea and lake ice thickness under both clear and cloudy sky conditions,
  - Very computationally efficient compared to more complex models such as NCAR’s Community Sea Ice Model (CSIM), and its sole objective of retrieving ice thickness and age makes it easy to implement with the application of satellite products,
  - Flexible, fast and easy to maintain and improve later with more and accurate satellite retrieved products like radiative fluxes, snow cover and snow depth over ice,
  - Independent of historical records for ice thickness and age estimation.
Ice Thickness and Age Observing System Overview

- **Products Generated**
  
  » Near real-time ice thickness and age estimates.

  » Ice thickness and age will be produced for each pixel observed by the VIIRS that is covered with ice.
Ice Thickness and Age Processing Overview

- **Top-Level Processing**

  OTIM and Ice age classification begin

  Surface air temperature, pressure, wind, and moisture

  Cloud mask, ice physical properties, snow cover, sea/lake mask

  Ice type

  For each pixel

  Surface albedo

  Surface temperature

  Surface radiative fluxes

  Surface heat fluxes

  One-dimensional Thermodynamic Ice Model - OTIM

  Sea/lake ice age classification

  For each pixel

  All-sky sea/lake ice thickness

  OTIM ice thickness/age classification end

  All-sky sea/lake ice thickness/age

VIIRS Channel Used: Retrieved products, e.g., cloud and IST

Algorithm Dependencies: See separate slide.

Ancillary Data Dependencies: NWP/NCEP/ECMWF, et al.

Products Generated: Ice thickness and age and associated quality flags.
Ice Thickness and Age
Algorithm Input

• No sensor input data, but retrieved products, are currently needed in the algorithm

• Three types of ancillary data needed:
  » **Static Non-VIIRS Data:**
     – Ice and snow microphysical properties
     – Surface land mask
  » **Dynamic Non-VIIRS Data:**
     – Surface air temperature
     – Surface wind speed
     – Surface air pressure
     – Surface air moisture
     – Snow cover and depth
Ice Thickness and Age
Algorithm Input

- Three types of ancillary data needed (cont.):

**VIIRS Channel Used:** Retrieved products, e.g., cloud.

**Algorithm Dependencies:** See separate slide.

**Ancillary Data Dependencies:** NWP/NCEP/ECMWF, et al.

**Products Generated:** Ice thickness and age and associated quality flags.
Ice Thickness and Age Algorithm Description

• Theoretical Basis

» Based on the surface energy balance at thermo-equilibrium, containing all components of the surface energy budget to estimate sea and lake ice thickness.

» Based on the estimated ice thickness and classification scheme, ice age will be determined.

» Analytical and numerical solution.
Ice Thickness and Age Algorithm Description

**One-dimensional Ice Model (OTIM)**

\[(1-\alpha_s) F_r - I_0 - F_l^{up} + F_l^{dn} + F_s + F_e + F_c = F_a \tag{1}\]

- \(\alpha_s\) is ice surface broadband albedo where ice may be covered with a layer of snow,
- \(F_r\) is downward solar radiation flux at the surface,
- \(I_0\) is the solar radiation flux passing through the ice interior,
- \(F_l^{up}\) is upward longwave radiation flux from the surface,
- \(F_l^{dn}\) is downward longwave radiation flux from the atmosphere towards the surface,
- \(F_s\) is turbulent sensible heat flux at the surface,
- \(F_e\) is turbulent latent heat flux at the surface,
- \(F_c\) is conductive heat flux within the ice slab,
- \(F_a\) is residual absorbed energy that contributes to melting at or near the surface.
Ice Thickness and Age Algorithm Description

- **One-dimensional Ice Model (OTIM) (Cont)**

\[
(1-\alpha_s) \, F_r - l_0 - F_{l_{up}} + F_{l_{dn}} + F_s + F_e + F_c = F_a
\]  

(1)

By the definitions of the terms in the equation (1), \(\alpha_s, F_r, l_0, F_{l_{up}}, F_{l_{dn}}\) should be always positive, and \(F_s, F_e, \) and \(F_c\) would be positive or negative in terms of the operational symbols used in the equation (1), and \(F_a\) is residual heat flux that would be zero in the absence of a phase change. The details of each term will be addressed in the following subsections.
Ice Thickness and Age Algorithm Description

Surface Net Solar Radiation = \( (1-\alpha_s) F_r \):

\[
\alpha_s = 1 - A \exp(-Bh) - C \exp(-Dh) \tag{2}
\]

where \( A, B, C, \) and \( D \) are the coefficients of which values can be determined from the Table on the next slide, and \( h \) is ice \((h_i)\) or snow \((h_s)\) thickness in meter.
Surface Net Solar Radiation = (1-α_s) F_r (Cont):

Ice Thickness and Age Algorithm Description

Surface Downward Solar Radiation Parameterizations = $F_r$:

Bennett (1982) scheme for the Arctic under clear sky condition:

$$F_r^{clr} = 0.72 S_0 \mu$$  \hspace{1cm} (4)

where $S_0$ is solar constant, and $\mu$ is cosine of solar zenith angle. This one is recommended for its simplicity and acceptable accuracy.

Bennett (1982) scheme for Arctic sea ice under cloudy sky condition:

$$F_r^{all} = F_r^{clr} (1 - 0.52 c)$$  \hspace{1cm} (5)

This one is recommended for its simplicity and acceptable accuracy for this study.
Ice Thickness and Age Algorithm Description

Surface Upward Longwave Radiation = $F_{\text{up}}^l$:

$$F_{\text{up}}^l = \varepsilon\sigma T_s^4 \quad (6)$$

- $\varepsilon$ is longwave emissivity of the ice or snow surface, default is 0.988,
- $\sigma = 5.6696 \times 10^{-8}$ $W \ m^{-2} \ deg^{-4}$ is the Stefan-Boltzman constant,
- $T_s$ is surface skin temperature in K.
Ice Thickness and Age Algorithm Description

**Surface Downward Longwave Radiation Parameterizations** = $F_i^{dn}$:

Ohmura (1981) scheme for the temperature range 243-289K under clear sky condition:

$$F_{i,clr}^{dn} = \sigma \ T_a^4 \ (8.733 \times 10^{-3} \ T_a^{0.788})$$  \hspace{1cm} (7)

where $\sigma$ is Stefan-Boltzman constant, $T_a$ is surface air temperature. This one is recommended for the simplicity and acceptable accuracy in this work.

Jacobs (1978) scheme for Arctic summer and winter under cloudy sky condition:

$$F_i^{dn} = F_{i,clr}^{dn} \ (1 + 0.26 \cdot c)$$  \hspace{1cm} (8)

where $c$ is fractional cloud cover. This one is recommended for the simplicity and acceptable accuracy in this work.
Surface Turbulent Sensible Heat Flux = \( F_s \):

\[
F_s = \rho_a \ c_p \ C_s \ u \ (T_a - T_s)
\]  \hspace{1cm} (9)

- \( \rho_a \) is the air density \( (1.275 \text{ kg}\cdot\text{m}^{-3}) \),
- \( c_p \) is the specific heat of air \( (1004 \text{ J}\cdot\text{Kg}^{-1}\cdot\text{K}^{-1}) \),
- \( C_s \) is the bulk transfer coefficients for heat and evaporation,
- \( u \) is surface wind speed,
- \( T_a \) is near surface air temperature at 2 m above the surface,
- \( T_s \) is surface skin temperature.
Surface Turbulent Latent Heat Flux = $F_e$:

$$F_e = \rho_a \ L \ C_e \ u \ (w_a - w_{sa})$$ (10)

- $\rho_a$ is air density (1.275 kg·m$^{-3}$),
- $L$ is latent heat of vaporization (2.5·10$^6$ J·Kg$^{-1}$),
- $C_e$ is the bulk transfer coefficients for evaporation,
- $u$ is surface wind speed,
- $w_a$ is surface mixing ratio,
- $w_{sa}$ is surface saturation mixing ratio.
Ice Slab Conductive Heat Flux = $F_c$:

$$F_c = \gamma (T_f - T_s)$$  \hspace{1cm} (11)

• $\gamma = \frac{(k_i k_s)}{(k_s h_i + k_i h_s)}$, $h_s$ is snow depth, and $h_i$ is ice thickness, $k_s$ is the conductivity of snow, $k_i$ is the conductivity of ice,

• $T_f$ is water freezing temperature,

• $T_s$ is ice/snow surface skin temperature in the unit of degree Celsius.
Ice Thickness and Age Algorithm Description

Relationship between Snow Depth and Ice Thickness

Doronin (1971) used the following relationship to estimate snow depth in terms of ice thickness, which was also used in Yu’s paper (1996):

\[
\begin{align*}
    h_s &= 0, & \text{for } h_i < 5 \text{ cm}; \\
    h_s &= 0.05 \cdot h_i, & \text{for } 5 \text{ cm} \leq h_i \leq 20 \text{ cm}; \\
    h_s &= 0.1 \cdot h_i, & \text{for } h_i > 20 \text{ cm}.
\end{align*}
\]

In reality, snow accumulation over the ice may not obey the relationship above, and most likely not be that simple. So we set snow depth as one input variable in the OTIM once climate data or measurements are available.
Ice Thickness and Age Algorithm Description

Relationship between Surface Skin Temperature and Ice Temperature

In general, we can obtain surface skin temperature $T_s$ through satellite retrieval techniques more or less directly, but not $T_i$ if the surface is covered with certain thick snow. Yu and Rothrock (1996) suggested that assuming $T_i$ equal to $T_s$ can cause 5% and 1% errors when ice is 5 cm thick and 100 cm thick, respectively. That assumption may hold valid when it is dark.

Relationship between Sea Ice Thickness and Sea Ice Salinity

Kovacs (1996) scheme:

$$S_i = 4.606 + 0.91603/h_i,$$

for $0.10 \text{ m} \leq h_i \leq 2.0 \text{ m}$.

Where $S_i$ is sea ice salinity (ppt), and $h_i$ is sea ice thickness.
Ice Thickness and Age Algorithm Description

Ice age determination strategy

• Generally speaking, older ice is thicker than younger ice. In essence, this assumption is valid as tested and verified by many other researchers (e.g., Tucker et al., 2001; Yu et al., 2004; Maslanik et al., 2007).

• There is an internationally accepted terminology for ice form and conditions, coordinated by the WMO.

• This terminology is used by the Canadian Ice Service as the basis for reporting ice conditions (refer to http://ice-glaces.ec.gc.ca/App/WsvPageDsp.cfm?ID=1&Lang=eng), and adopted here with minor modifications for classifying ice age in terms of ice thickness.
Ice Thickness and Age Algorithm Description

Ice age determination – Lake ice age

- **New**: Recently formed ice *less than 5 cm* thick
- **Thin**: Ice of varying colors, *5-15 cm* thick
- **Medium**: A further development of floes or fast ice, *15-30 cm* thick
- **Thick**: Ice *30-70 cm* thick
- **Very Thick**: Floes or fast ice developed to *more than 70 cm* thickness
Ice Thickness and Age Algorithm Description

Ice age determination – Sea ice Age

- **New**: New ice 0~10 cm thick. A general term for recently formed ice which includes frazil ice, grease ice, slush, shuga. And nilas. These types of ice include ice crystals which are only weakly frozen together (if at all) and have a definite form only while they are afloat, and a thin elastic crust of ice, easily bending on waves and swell and under pressure growing in a pattern of interlocking “fingers” (finger rafting).

- **Grey Ice**: Young ice 10-15 cm thick. Less elastic than nilas and breaks on swell. Usually rafts under pressure.

- **Grey-white Ice**: Young ice 15-30 cm thick. Under pressure it is more likely to ridge than to raft.

- **Thin First-year Ice**: First-year ice of not more than one winter's growth, 30-70 cm thick.

- **Medium First-year Ice**: First-year, ice 70-120 cm thick.

- **Thick First-year Ice**: First-year ice 120-180 cm thick.

- **Old Ice**: Sea ice which has survived at least one summer's melt. Generally *more than 180 cm* thick. May be subdivided into second-year ice and multi-year ice.
  - **Second-year Ice**: Old ice which has survived only one summer's melt.
  - **Multi-year Ice**: Old ice which has survived at least two summer's melt.
Ice Thickness and Age
Algorithm Processing Details

- Direct Solution from Conductive Heat Flux
  - Fresh Water Ice
    
    For fresh water or lake ice, \( S_w = 0, \ S_i = 0, \ T_f = 273.16K, \ k_i = k_0 \), therefore it is easy to reorganize equation (1) into the following form and get analytical solution for ice thickness \( h_i \):

    \[
    F_c = \frac{k_0 k_s}{k_s h_i + k_0 h_s} (T_f - T_s)
    \]
    
    \[
    h_i = \frac{k_0}{F_c} \cdot (T_f - T_s) - \frac{k_0}{k_s} \cdot h_s
    \]
Ice Thickness and Age
Algorithm Processing Details

- **Direct Solution from Conductive Heat Flux**
  - **Sea Ice**

  \[
  k_i = \frac{(k_0T_i - T_0k_0 + \beta S_0)h_i + \beta S_1}{(T_i - T_0)h_i}
  \]

  where \(S_0=4.606\), \(S_1=0.91603\), and \(T_0=273.15\).

  Let \(T_i - T_0 = u\), \(T_f - T_s = v\), \(F_c = f\), then from the Eq. (27) and (30) we have

  \[
  f = \frac{k_i k_s}{k_i h_i + k_s h_s} \cdot v
  \]

  and let \(a = f k_i u\), \(b = (k_0 u + \beta S_0)(f h_s - k_s v)\), \(c = \beta S_1\), \(h = h_i\), we have ice thickness monadic quadratic equation as \(ah^2 + bh + c = 0\), therefore when \(b^2 - 4ac \geq 0\), two real solutions exist as

  \[
  h_1 = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \quad \text{and} \quad h_2 = \frac{-b - \sqrt{b^2 - 4ac}}{2a}
  \]

  When \(b^2 - 4ac = 0\), \(h_1 = h_2\); and when \(b^2 - 4ac < 0\), no real solution for ice thickness.
**Ice Thickness and Age**

**Algorithm Processing Details**

- **Solving the OTIM for Ice Thickness**

The OTIM can be solved for ice thickness analytically or numerically in terms of input options and variable status as described in the following subsections. First let’s rewrite the Eq. (1) into the following form:

\[
(1 - \alpha)(1 - i)F_r + F_c + F = 0
\]

where \( F = -F_{l_{up}} + F_{l_{dn}} + F_s + F_e - F_a \), \( \alpha = \alpha_s \).

\[
\alpha = 1 - A_s e^{-B_s h} - C_s e^{-D_s h}, \text{ where } h \text{ is ice/snow thickness, and } A_s, B_s, C_s, D_s \text{ are coefficients to be determined from Table 2.}
\]

\[
i = A_i e^{-B_i h} + C_i e^{-D_i h}, \text{ where } i \text{ is ice transmittance, and } A_i, B_i, C_i, D_i \text{ are coefficients to be determined from Table 3.}
\]

\[
F_c = r(T_f - T_s), \text{ let } T_f - T_s = T_r, \text{ } T_i - T_0 = T_k, \text{ } S_i = S_0 + S_1 h, \text{ and } k_0 T_k + \beta S_0 = g, \text{ we have}
\]

\[
k_i = \frac{(k_0 T_k + \beta S_0)h + \beta S_1}{T_k h}, \quad r = \frac{k_s[(k_0 T_k + \beta S_0)h + \beta S_1]}{k_s(T_k h^2 + \beta S_1) + h_s(k_0 T_k + \beta S_0)h},
\]

\[
F_c = \frac{k_s T_r (gh + \beta S_1)}{k_s(T_k h^2 + \beta S_1) + h_s gh}.
\]
Ice Thickness and Age Algorithm Processing Details

- Solving the OTIM for Ice Thickness
  - Known Surface Albedo and Known Ice Transmittance

If the values of ice/snow surface albedo $\alpha$ and the ice slab transmittance $i$ are both known, let

$$(1 - \alpha)(1 - i)F_r + F = F_1,$$

then we have $F_1 + F_c = 0$, so

$$F_1 + \frac{k_s T_r (gh + \beta S_1)}{k_s (T_k h^2 + \beta S_1) + h_s gh} = 0.$$

$$F_1 k_s T_k h^2 + (F_1 h_s g + k_s T_r g) h + F_1 \beta S_1 + k_s \beta S_1 T_r = 0,$$

let $a = F_1 k_s T_k$, $b = F_1 h_s g + k_s T_r g$, and

$$c = F_1 \beta S_1 + k_s \beta S_1 T_r,$$

then $h = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$, when $b^2 - 4ac \geq 0$, there are real solutions.
Ice Thickness and Age Algorithm Processing Details

- Solving the OTIM for Ice Thickness
  - Known Surface Albedo and Unknown Ice Transmittance

If the value of ice surface albedo $\alpha$ is known or snow is present over the ice with known depth, but the ice slab transmittance $i$ is unknown, let $(1-\alpha)F_r = F_{ra}$, then $(1-i)F_{ra} + F_c + F = 0$. Let $F + F_{ra} = F_2$, then $F_c - iF_{ra} + F_2 = 0$, so we have

$$\frac{k_s T_r (gh + \beta S_1)}{k_s (T_k h^2 + \beta S_1) + h_s gh} - F_{ra} (A_i e^{-B_i h} + C_i e^{-D_i h}) + F_2 = 0,$$

after a series of derivation, we finally have

$$F_{ra} (A_i e^{-B_i h} + C_i e^{-D_i h}) (k_s T_k h^2 + h_s gh + k_2) - [F_2 k_s T_k h^2 + (g k_s T_r + F_2 g_2) h + T_r k_2 + F_2 k_2] = 0,$$

where $k_2 = k_s \beta S_1$, $g_2 = h_s g$. There is no analytical solution for this nonlinear equation, numerical approach must be applied to solve it for the ice thickness $h$. 
Solving the OTIM for Ice Thickness

**Unknown Surface Albedo and Known Ice Transmittance**

If the value of ice surface albedo \( \alpha \) is unknown, but the ice slab transmittance \( i \) is known, let \( (1 - i)F_r = F_{ri} \), then \((1 - \alpha)F_{ri} + F_c + F = 0\). We know \( \alpha = 1 - (A_s e^{-B_s h} + C_s e^{-D_s h}) \), therefore

\[
F_{ri} (A_s e^{-B_s h} + C_s e^{-D_s h}) + F_c + F = 0, \quad \text{and} \quad F_c = \frac{k_s T_r (gh + \beta S_1)}{k_s (T_k h^2 + \beta S_1) + h_s gh}.
\]

Finally, we have

\[
F_{ri} (A_s e^{-B_s h} + C_s e^{-D_s h})(k_s T_k h^2 + g_2 h + k_2) + Fk_s T_k h^2 + (k_s T_r g + F g_2)h + (1 + F)k_2 = 0,
\]

where \( k_2 = k_s \beta S_1 \), \( g_2 = h_s g \). There is no analytical solution for this nonlinear equation, numerical approach must be applied to solve it for the ice thickness \( h \).
Ice Thickness and Age
Algorithm Processing Details

- **Solving the OTIM for Ice Thickness**
  - Unknown Surface Albedo and Unknown Ice Transmittance

If the values of both ice surface albedo $\alpha$ and ice slab transmittance $i$ are known, we have

$$(1 - \alpha)(1 - i)F_r + F_c + F = 0, \alpha = 1 - (A_s e^{-B_s h} + C_s e^{-D_s h}), i = 1 - (A_i e^{-B_i h} + C_i e^{-D_i h}),$$

$$F_c = \frac{k_s T_r (gh + \beta S_1)}{k_s (T_k h^2 + \beta S_1) + h_s gh}, \text{ and } F = -F_{l_{up}} + F_{l_{dn}} + F_s + F_e - F_a. \text{ After a series of derivation,}$$

$$F_r (A_s e^{-B_s h} + C_s e^{-D_s h})(1 - A_i e^{-B_i h} - C_i e^{-D_i h})(k_s T_k h^2 + g_2 h + k_2) + F k_s T_k h^2 + (k_s T_r g + F g_2)h + (1 + F)k_2 = 0, \text{ where } k_2 = k_s \beta S_1, g_2 = h_s g. \text{ There is no analytical solution for this nonlinear equation, numerical approach must be applied to solve it for the ice thickness } h.$$
Solving the OTIM for Ice Thickness

» Nighttime and Hybrid Solution

For hybrid method, the term $F_a = (1-\alpha)(1-i)F_r + F_a$ is estimated by regression with surface and near surface atmospheric conditions.

At night, there is no need to consider solar radiation in the OTIM, so basically we can set $F_r = 0$, therefore from $(1 - \alpha)(1 - i)F_r + F_c + F = 0$, we have $F_c + F = 0$, and we know

$$F_c = \frac{k_s T_r (gh + \beta S_1)}{k_s (T_k h^2 + \beta S_1) + h_s gh}, \quad \text{so} \quad \frac{k_s T_r (gh + \beta S_1)}{k_s (T_k h^2 + \beta S_1) + h_s gh} + F = 0. \text{Finally we have}$$

$$F k_s T_k h^2 + (k_s T_r g + F g_2) h + (1 + F) k_2 = 0$$

Let $a = F k_s T_k$, $b = k_s T_r g + F g_2$, $c = (1 + F) k_2$, then we have $ah^2 + bh + c = 0$, so the solution for the monadic quadratic equation is $h = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$, and when $b^2 - 4ac \geq 0$, there are real solutions.
Ice Thickness and Age
Physical Description Summary

- The OTIM is based on the surface energy balance at thermo-equilibrium state that contains all components of the surface energy budget to estimate sea and lake ice thickness, and then based on the ice thickness, ice age is classified into new/fresh, grey, grey-white, first year thin, first year medium, first year thick, and multi-year ice.
Ice Thickness and Age Algorithm Practical Considerations

- **Numerical Computation Considerations**
  - The OTIM is implemented sequentially. Because ice thickness and age retrievals relies on the values of the ancillary data flags, the ancillary data flags need to be computed first.

- **Programming/Procedural Considerations**
  - Needs spatial information for accurate pixel geographic location and land mask information for identifying sea, lake, river, and et al.
  - Needs temporal information for each pixel regarding the solar radiation in case daytime algorithm is used.
  - The algorithm operates pixel by pixel.
### Quality Assessment and Diagnostics

- Monitor the percentage of pixels retrieved for ice thickness, and check the value uniformity over the small and smooth area without cracks and leads.
- Check input ancillary data such as surface skin temperature, air temperature, humidity, wind speed, and snow depth for all pixels of the OTIM. See how those ancillary variables changes affect ice thickness estimation.
- Periodically image the individual test results to look for artifacts or non-physical behaviors.
- Maintain a close collaboration with the other teams using the OTIM in their product generation.
Ice Thickness and Age Algorithm Practical Considerations

- **Exception Handling**
  - This includes checking the validity of input data before applying the OTIM and ice age algorithm.
  - The OTIM does check for conditions where the OTIM can not be performed. These conditions include missing input variables values and unsolvable numerical solutions. In those cases, the appropriate flag is set to indicate that no ice thickness and age are produced for that pixel.

- **Algorithm Validation**
  - Quasi-routine validation of the OTIM performance can be performed at several Canadian stations where the New Arctic Program of the Canadian Ice Service has been running since 2002.
  - Other occasional field experiments and submarine cruise measurements can also been used for validation purpose.

• Submarine Cruise Measurements

A program called Scientific Ice Expeditions (SCICEX) used U.S. Navy submarine for research. SCICEX data are not classified and do not have restrictions on reporting the precise location and date for the data; therefore the SCICEX ice draft data in this collection are reported with their date of acquisition, and position is reported to six decimal places, which make the SCICEX data suitable for scientific study. The U.S. Navy submarine track is shown on the right figure.
Comparison of ice thickness cumulative distribution retrieved by OTIM with APP-x data, measured by submarine, and simulated by Pan-Arctic Ice-Ocean Modeling and Assimilation System (PIOMAS) developed by Polar Science Center at University of Washington.
Comparisons of ice thickness values retrieved by OTIM with APP-x data, measured by submarine, and simulated by PIOMAS alone the submarine track segments.

• Station Measurements

The Canadian Ice Service (CIS) maintains archived Ice Thickness and On-Ice Snow Depth Measurements for Canadian Stations back as far as 1947 for the first established stations in the Canadian Arctic (Eureka and Resolute). But, unfortunately, By the beginning of 2002 most stations from the original Ice Thickness program had stopped taking measurements.
Ice Thickness and Age Algorithm Performance Estimate

Station Measurements

Fortunately, due to an increasing interest in updating this historical dataset to support climate change studies a new program was started in the fall of 2002, called New Arctic Program starting from 2002. Several stations in the Canadian Arctic were re-opened and started taking measurements. These New Arctic Program stations are listed in the Table on the right.

Ice Thickness and Age
Algorithm Assumptions and Limitations

- **Algorithm Performance**
  - The algorithm is executed in a completely automated fashion.
  - The algorithm is computationally efficient.
  - The algorithm is only used when the ice is identified with /without snow cover on it.
• Sensor Performance

» All satellite channel calibration will be correct and uniform from image to image for correct product retrievals to be called by this work, especially:
  - Surface skin and air temperature,
  - Surface radiation fluxes,
  - Surface air moisture, wind, and pressure.

» Satellite navigation errors are not present. Correct navigation is vital during automated processing for correct locations of ice and snow.
Ice Thickness and Age
Algorithm Assumptions and Limitations

- Assumptions and Proposed Mitigation Strategies
  - Atmospheric profile and wind speed data are available from NWP or other teams’ retrieved products. In case no profile data available, it is valid assumption as used by other researchers that surface air temperature generally is about 0.5 ~ 2 degree higher than surface skin temperature depending on the cloud condition, and relative humidity is about 90% over ice/snow, and wind speed of 10~20 m/s at night. But wind speed should be observed or simulated to guarantee to be realistic.

  - Radiation fluxes are available from NWP or other teams’ products, otherwise parameterizations will be used and assumed reliable, and accurate enough for each pixel. (*Use parameterization schemes over ice and/or snow surface from Bennett (1982), Ohmura (1981), Jacob (1978) as recommended.*)
Assumptions and Proposed Mitigation Strategies

» Snow maps and climatological depths are available from NWP or other teams’ products, or general assumption of 2~15 cm snow depth will be used over ice. (*Use snow information from NWP or elsewhere*).

» Land mask maps are also available to identify different surface types.

» All of the static ancillary data is available at the pixel level. (*Reduce the spatial resolution of the surface type, land mask and or coast mask*).
Ice Thickness and Age
Pre-Planned Improvements

• Algorithm Improvement
  » The OTIM serves other applications. Its development is closely tied to the development and feedback from the other team algorithms and ancillary data.

  » Improve and/or develop reliable and efficient parameterization schemes for ice/snow reflectance, transmittance, emissivity, conductivity, salinity, and et al.

  » Investigate modification to snow information on the ice, and radiation estimation over the ice.

Chernigovskiy, N.T., 1963, Radiation properties of the central Arctic ice cover, Trudy Arkticheskogo I Antarkticheskogo Nauchno-Issledovatel'skogo Instituta, Tom 253, 249-260.

Software Architecture
and Interfaces

Presented by
Walter Wolf
Software Architecture

- **Purpose:** Demonstrate that the algorithm process flow provides for an implementation that is consistent with the theoretical basis and meets requirements.
CDR Software Architecture

- A preferred solution has been selected for the Aerosol, Cloud and Cryosphere Products

- The software system is an integrated collection of software elements, or code, that implements the preferred solution, producing well-defined output products from a well-defined set of input data.

- The software architecture describes the structure of the system software elements and the external and internal data flows between software elements.
Software Architecture Levels

- **Context Level - 0**
  - External Interfaces

- **System Level - 1**
  - Flows Between Units

- **Unit Level - 2**
  - Flows Within Units

Software Architecture Levels

Context Level - 0
- External Interfaces

System Level - 1
- Flows Between Units

Unit Level - 2
- Flows Within Units

Sub-Unit Level - 3
- Flows Within Sub-Units
External Interfaces -- Definition

- An external input is defined as a data source needed by the system that is produced or made available by a process external to the system.

- An external output is defined as a product that is created by the system for an external user.
External Interfaces - Criteria

- Most input/output data files for the Aerosol, Cloud and Cryosphere algorithms will be in NetCDF4 format.
  » Exceptions:
    - NCEP model forecast data
    - CRTM coefficients
    - PCF file
    - Log file

- The data passed to the units and sub-units will be stored in arrays.
External Interface Design at CDR

AIT Framework
Purpose

- Purpose: Demonstrate that the AIT Framework provides an infrastructure that will enable the implementation of the Aerosol, Cloud and Cryosphere algorithms that meet the requirements.
The STAR AIT Framework is a main program designed to run any scientific algorithm.

- The Framework is a C++ program that interfaces with C++/C/Fortran 90/95 algorithms.
- The Framework is run by perl scripts.
- Production Control Files (PCF) determine what algorithms are run when the framework is executed.
STAR AIT Framework Details

- Common ancillary data is used across algorithms (where possible)
- Forward model is run once for all algorithms
- Satellite data and ancillary data is stored in memory for use by the algorithms
- Algorithms may be run in any order – determined by the PCF file
STAR AIT Framework

Algorithms

- Algorithms plugged into the framework are subroutine calls
- Data is not read within the algorithm, all input data is either passed into the algorithm or is read via a function call
- Readers and writers of all types of input and output data are treated as algorithms
The following slides show the data flow and interfaces in the framework.

Inputs

- PCF files

- Data
  - Common ancillary data
  - Radiance data
  - Specific algorithm data
• Production Control Files (PCF) contain the information required to run an algorithm
  » Algorithm dependencies to determine product precedence
  » Algorithm specific variables such as flags and thresholds
  » Framework loads the contents of the PCF file when the algorithm has been flagged to run in the configuration file or if it is needed by something that has been flagged to run in the configuration file.
PCF File: 3 Main Sections

- **DEPENDENCIES**
  - List the Type and PCF ID for each dependency the algorithm requires

- **OTHER**
  - This section contains algorithm specific variables such as thresholds, flags, etc that are flexible and can be changed at run time.

- **TEMPORAL**
  - This section dictates temporal needs for the algorithm if requested.
PCF Layout Example
(Default_PCF/MSG8/SEVIRI/AWG_Cloud_Mask.pcf)

```
# AWG_CLOUD_MASK

AWG_CLOUD_MASK  PCF ID indicates beginning of entry.

PRODUCT  PRODUCT or ANCILLARY

# Set flag for output
OUTPUT_TO_FILE: Y  Output result to file (Y/N)

# Dependencies
DEPENDENCIES:

"DEPENDENCIES" keyword indicates dependency section of the PCF.

SATELLITE_DATA:

SATELLITE_DATA dependency type doesn’t have a dependency below. The framework will look for what satellite data to use in the config file. This avoids tedious modification to each PCF.

LAND_MASK:  Dependency Type

LAND_MASK  Dependency PCF ID
```
COAST_MASK:
COAST_MASK_NASA_1KM

DESERT_MASK:
DESERT_MASK

SNOW_MASK:

SURFACE_ELEVATION:
SFC_ELEV_GLOBE_1KM

SURFACE_EMISSIVITY:
SFC_EMISS_SEEBOR
SFC_EMISS_CONSTANT

NWP_DATA:
NWP_GFS
Temporal data is special – has it’s own section that needs to be filled out if it is specified to run.

“TEMPORAL” keyword indicates temporal section. Only required for algorithms needing temporal data.

Timestep_Type: MSG_SEVIRI  
-1 = most recent previous time step

Actual_Time: -900.0  
Actual time difference in seconds. (-15 min)

Load keyword tells system the following list needs to be loaded into the system as temporal data.

AWG_CLOUD_MASK = /need/to/create/file  
PCF ID & Filename
# Settings

CldMask_Packed_Constant: 4
Flag_Constant: 24
Ancillary_Path: cloud_team_delivery_0/data_algorithms/
Ancillary_SubDir: baseline_cloud_mask/

END AWG_CLOUD_MASK

Keyword “OTHER” indicates algorithm variables/settings section.

AWG_CLOUD_MASK specific variables.

End of algorithm entry
Specific Algorithm Data

- Each algorithm currently reads its own specific ancillary data (such as coefficient files, look up tables, etc)

- See algorithm section for details
The following 6 slides show the ancillary data product precedence information:

- VIIRS SDR data
- Static Ancillary data
- Dynamic Ancillary data
- Radiative Transfer Model (RTM)

The full product precedence chart for the Aerosol, Cloud and Cryosphere algorithms is shown later in this section.

Output Files

- Output files are in NetCDF format
- See individual algorithms for details on the contents
STAR Hardware

- Rack of Linux Dell Processors (72 CPUs) for product development.

- 20 TB of disk space on the SAN for all simulated data, proxy data and products.
Software/Compilers

- Framework uses netCDF libraries
  - NetCDF 4
  - HDF 5 (required by NetCDF 4)
- Framework uses wgrib commands
- Perl scripts
  - Code generation
  - Standards checking
- Currently runs on Intel 12+ compilers
- ClearCase and ClearQuest used for version control
- Valgrind used to check for memory leaks

System Level Data Flow – Precedence

VIIRS Level 1B → Cloud Mask → Snow Cover

Ice Concentration/Cover And Ice Surface Temperature → Ice Thickness/Age
The framework reads in common datasets such as VIIRS SDR and ancillary data for all products. The following apply to Cryosphere products:

- VIIRS SDR
- Land/Coast Mask
- Surface Elevation
- NWP
The framework checks the precedence to produce cryosphere products. It will run the following products upstream:
» VIIRS Cloud mask

All the ancillary data including VIIRS SDR will be passed to the cryosphere algorithms through data structures.

Cryosphere algorithms read in their product specific inputs such as look up table and coefficient files.

Cryosphere product outputs will be sent back to the framework through data structures.

Detailed Design

Presented by

Walter Wolf
The design overview builds on the software architecture by providing a high level description of each system element that is defined in the software architecture.

The design overview describes the project system’s functionality and design characteristics at a high level that covers, for each system elements:

» Its purpose
» External interfaces
» Decomposition into sub-elements
» Functional sequence
» Design Language
» Input and Output File Descriptions
Design Overview

• Fully defines the structure and capabilities of the software product components.
  » Software architecture details are finalized
  » Software components are completely defined
  » Interfaces to software components are fully characterized
  » Connects the design to the allocated product-component requirements, architecture, and higher level designs
• Metadata design should respond to metadata requirements

• There is no archive requirement for this project, so the only metadata will be product level metadata for OSPO trending

• From our experience, the Cryosphere Team can populate the metadata from Snow Cover, Ice Cover & Concentration, Ice Age, and Ice Surface Temperature
Produce fractional snow cover, fractional grain size, fractional vegetation cover, fractional rock/soil cover, and fractional other (ice) with associated quality flags.

Interfaces
- VIIRS calibrated and navigated reflectance in bands I1, I2, and I3 along with solar and satellite view angles
- VIIRS Cloud Mask
- Land/water mask
- Surface elevation
- Snow cover climatology
- Land surface climatology
- Algorithm control parameters (threshold values)
Snow Cover Unit Description (2)

Retrieval algorithm

- Read input data
- Pixel-by-pixel snow detection
- Consistency testing, filtering
- Write out results

Loop Through Pixels

- If water (not land)
- If cloud obscured or cloud shadow
- If insufficient illumination
- Apply spectral tests

End Loop Through Pixels

Preliminary Output Data
Snow Cover Map (Granule)
Quality flags
Assumptions applied to the unit design:
» VIIRS observation data are within specifications
» Cloud mask accuracy is the same as the accuracy of the current VIIRS operational cloud mask

Limitations applied to the unit design:
» No retrievals in cloudy conditions and at night
Ice Concentration and Cover Unit Description (1)

- Produces ice concentration and ice cover with associated quality flags.

- Interfaces
  » VIIRS calibrated and navigated reflectance for channels I1, I2, and I3 with Brightness Temperature in Channel M5, M7, M10, M15 and M16 along with solar and satellite view angles
  » VIIRS Cloud Mask
  » Land/Water Mask
Ice concentration and extent algorithm begin

VIIRS channel radiance, satellite viewing angles, cloud mask, land/water mask

Group-criteria detection

Ice

Tie point algorithm

Ice concentration

Ice extent

Ice concentration and extent algorithm end
Design Language – FORTRAN 90/95

Assumptions apply to the unit design:
- VIIRS reflectance and brightness temperature data are within specs.
- Cloud mask eliminates all possible cloud contamination

Limitations apply to the unit design:
- Changes of reflectance/temperature in each search window are mainly caused by difference in ice concentration
• Produce ice surface temperature with associated quality flags.

• Interfaces
  » VIIRS calibrated and navigated Brightness Temperature in Channels M15 and M16 with solar and satellite view angles
  » VIIRS Ice Concentration & Ice Cover
  » VIIRS Cloud Mask
  » Land/Coast Mask
Ice Surface Temperature
Unit Description (2)

High Level Flowchart of the ice surface temperature algorithm

- **step1**
  - Group-criteria detection
  - Ice

- **step2**
  - IST regression algorithm
  - Ice surface temperature

1. **Ice surface temperature algorithm begin**
2. VIIRS channel radiance, satellite viewing angles, cloud mask, land/water mask, ice concentration
3. **Ice surface temperature algorithm end**
Design Language – FORTRAN 90/95

Assumptions apply to the unit design:
» VIIRS radiance data are within specs.
» Cloud mask eliminates all possible cloud contamination.

Limitations apply to the unit design:
» None
Produce ice age and ice thickness with associated quality flags.

**Interfaces**
- VIIRS Cloud mask and fraction
- VIIRS Surface skin temperature
- VIIRS Surface broadband albedo (daytime only)
- VIIRS Ice mask and concentration
- VIIRS Surface solar radiation
- VIIRS Surface thermal radiation
- VIIRS Navigation information
- Land Mask
- Ice and snow microphysical properties (coefficient file)
- Surface temp., press., moisture, wind speed, snow cover, snow depth from NWP
**Ice Thickness/Age Unit Description (2)**

**OTIM and Ice age classification begin**

- Surface air temperature, pressure, wind, and moisture
- Cloud mask, ice physical properties, snow cover, sea/lake mask

**Ice type**

- For each pixel

**One-dimensional Thermodynamic Ice Model - OTIM**

**Sea/lake ice age classification**

**OTIM ice thickness/age classification end**
Ice Thickness/Age Unit Description (3)

- Design Language – FORTRAN 90/95

- Assumptions that apply to the unit design
  » VIIRS radiance data are within specs.
  » NWP data is available
  » Land/Sea Mask is available
  » All static ancillary data is available at the pixel level

- Limitations that apply to the unit design
  » None

Algorithm Package

Presented by

Walter Wolf
The DAP shall contain:

- Science algorithm source code, including make files and scripts.
- Test plans, test description, test procedures, and detailed performance testing results.
- Test input data, temporary files, and expected output data.
- Coefficient files and/or look-up tables.
- Quality monitoring information (quality flags, quality flag values).
- Production rule-set definitions.
- Product file specifications – layout, content, and size.
- Data flow diagrams.
- List of exit codes and their associated messages.
- List of expected compiler warnings (see bullet 5 below).
- Estimates of resources required for execution.
- Algorithm Theoretical Basis Documents (ATBDs) or reference to where the ATBDs can be obtained.
- Delivery Memo.
- README text file.
Delivery memo will contain:
- Point(s) of contact for questions specific to the algorithm (include name, telephone, e-mail address).
- List of delivery contents.
- Purpose of the delivery, e.g. an initial release, modification, etc.
- Description of problem(s) resolved, if any, and method of resolution.
- Description of significant changes from previous version, if any.
- List of documents updated/added/superseded, if any.
- List of known remaining defects.

The README text file in the DAP must contain:
- Location of all required DAP contents.
- DAP version number.
- Supporting COTS/Open Source software package requirements.
- Target configuration for setup (directories and files after setup scripts have been executed). This is understood to be a list of where everything is located once the DAP has been unpacked.
- Other pertinent information as judged by the algorithm developer(s) (e.g. compiler settings, etc.).

Quality Assurance

Presented by

Walter Wolf
Quality Assurance
Background

- STAR has used the Capability Maturity Model Integrated (CMMI) to improve processes and practices for development and the transfer of research to operations.

- The Product Monitoring Project will follow the updated SPSRB process that has been influenced by the STAR EPL process.
• The Requirements Review (December 2012)
  » Will present the initial draft of the requirements and a Requirements Allocation Document (RAD) has been made available to the project stakeholders. It will be updated throughout the lifecycle of the project.

• The Critical Design Review (April 2013)
  » To finalize requirements and to verify that the chosen design is able to meet those requirements.

• A Test Readiness Review (Oct 2013)
  » Will present the unit tests to demonstrate that the system is ready to be run in the Test Environment.

• A Software Review (February 2014)
  » Will be conducted to ensure that the Product Monitoring software is able to fulfill the functional software requirements.

• The System Readiness Review (May 2014)
  » Will show that the Product Monitoring System is ready to be transitioned to operations.
• STAR CM Tool (IBM Rational ClearCase, Version 7.0)
  » Has been purchased and implemented in the Collaborative Environment.

• OSPO CM Tool – Subversion
  » Open source

• CM personnel have been identified.

• CM training:
  » Administrator training completed.
  » If required, developers will be trained by the CM administrator.
SPSRB Coding Standards

- Coding standards guidelines and quick references are available.
- Provide a common list of abbreviations.
- Adhere to the standards throughout the development life cycle.
- Have checklists available for developers to keep track of the delivery status of the code.
- Code is checked for compliance during the software review.
The JPSS Risk Reduction software will be delivered incrementally as part of the series of algorithm package deliveries.

This will allow system testing of the code within NDE.
Quality Assurance – Software

- All code development is being conducted on a platform that is nearly identical to the test and production target platforms using the same compilers and operating system.

- STAR code checking tools will be used to minimize coding bugs and to ensure that software meets the coding standards.

- The status of all system calls and intrinsic functions are checked.

- Unit tests will be conducted for each product individually.
  - The PALs will have access to test data products to verify that values appear reasonable.
Quality Assurance – Software

- An official algorithm package will be delivered:
  - All Product Monitoring code and system files
  - Test plans
  - Test data sets
  - Error messaging/handling
  - Configuration files
  - Production rules
  - Database specifications
  - Data flow diagrams
  - Estimates of resource usage
  - Delivery memo
Quality Assurance – Products

• JPSS Risk Reduction developers will work with:
  » The algorithm developers to ensure that the implemented algorithms are producing the correct results
  » The PALs to ensure that the system has been implemented correctly
  » The users to ensure that the products are what the users require
Quality Assurance – Archive and Maintenance

- Archive Plan
  » Currently no plan to archive any of the products

- Long Term Maintenance Plan
  » The Product Monitoring System will be maintained by the OSPO staff
  » STAR system developers will be available
Quality Assurance – Documentation and Metadata

- Documentation/Metadata Plan
  - The Documentation will include the SPRSB documents with the RAD and RID
  - Metadata associated with these products are the variables that may be used for product monitoring
Quality Assurance
Summary

- Quality assurance plan will consist of:
  » Project reviews at which stakeholders are encouraged to participate.
  » Ongoing interaction with algorithm developers, NDE and OSPO PALs.
  » Adhering to SPSRB software standards and use of standard libraries only.
  » Software unit tests shall be presented in the TRR.
  » Documentation of the code operation, production rules, and software tests will be in the algorithm package.
  » Documentation of requirements will be in the Product Monitoring RAD.
  » Early release of software will allow for early system implementation.

Risks and Actions

Presented by

Walter Wolf
Risk 1 Algorithm has been developed and tested with the current VIIRS operational cloud mask. Algorithm will need tuning when the NOAA unique cloud mask is used

Mitigation:
- Start testing and evaluating the new cloud mask as soon as it is available
Risk 2: Persistent cloud cover and false cloud detection in the polar regions

Mitigation:
- Work closely with the cloud team to ensure accurate cloud classification
- Use alternate source of snow/ice information (GFS, IMS, Global Snow & Ice Mapping System) to flag persistent cloud
• **Risk 3:** Lack of truth data for ice concentration and cover validation
  » **Mitigation:**
    - Work with the community to develop more truth data sites
Risk and Actions Summary

- There are currently 3 risks identified from the CDR

- All 3 risks remain open
  - With a severity of Medium
Outline

- Introduction
- Requirements

Summary and Conclusions

Presented by
Walter Wolf
Review Objectives Have Been Addressed

- The following have been reviewed
  - Requirements
  - Operations Concept
  - Algorithm Theoretical Basis
    - Snow Cover
    - Ice Surface Temperature
    - Ice Concentration and Cover
    - Ice Thickness and Age
  - The Software System Architecture
  - The Detailed Design
  - The Quality Assurance Plan
Next Steps

• Begin preparing the documentation

• Code Development phase
  » Develop and implement algorithms
  » Begin software deliveries to the AIT

• Test Readiness Review is the next major review for the Cryosphere products.
Open Discussion

- The review is now open for free discussion
