

## Table of Contents

The NOAA KLM User's Guide is a comprehensive document describing the orbital and spacecraft characteristics, instruments, data formats, miscellaneous but pertinent information of the NOAA-K,L,M,N,N' satellites, as well as, the Metop series satellites as it pertains to the NOAA instruments.

- **Cover Page:**
- **Disclaimer:** A disclaimer from the editor of the NOAA KLM User's Guide.
- **Acknowledgments:** A letter of thanks for all those who helped out.
- **Acronyms and Abbreviations:** A listing of acronyms and abbreviations used in the NOAA KLM User's Guide.
- **List of Figures:** A listing of all figures in the NOAA KLM User's Guide.
- **List of Tables:** A listing of all tables in the NOAA KLM User's Guide.
- **NOAA-N, -N' Supplement:** A Listing of links with specific changes for the NOAA-N and -N' spacecraft.
- **Amendments:** A listing of revisions made to the NOAA KLM User's Guide.

### Section 1:

- **Section 1.0:** Introduction to the NOAA KLM System
- **Section 1.1:** The NOAA KLM Concept
- **Section 1.2:** NOAA KLM Spacecraft Characteristics

### Section 2:

- **Section 2.0:** NOAA Polar Satellite Navigation and Earth Location
- **Section 2.1:** Navigating the Polar Satellites
- **Section 2.2:** Earth Locating the Polar Satellite Data
- **Section 2.3:** Navigation and Earth Location Processing Within NOAA
- **Section 2.4:** Interpolating the Level 1b Earth Location Data

### Section 3:

- **Section 3.0:** Description of the NOAA KLM Sensor Package

- **Section 3.1:** Advanced Very High Resolution Radiometer/3 (AVHRR/3)
- **Section 3.2:** High Resolution Infrared Radiation Sounder (HIRS)
- **Section 3.3:** Advanced Microwave Sounding Unit-A (AMSU-A)
- **Section 3.4:** Advanced Microwave Sounding Unit - B (AMSU-B)
- **Section 3.5:** Space Environment Monitor (SEM-2)
- **Section 3.6:** Data Collection System/2 (DCS/2)
- **Section 3.7:** Search and Rescue Satellite (SARSAT) Instrument
- **Section 3.8:** Solar Backscatter Ultraviolet Spectral Radiometer (SBUV/2)
- **Section 3.9:** Microwave Humidity Sounder (MHS) [For NOAA-N and -N' only]

#### **Section 4:**

- **Section 4.0:** Real-Time Data Systems for Local Users
- **Section 4.1:** HRPT System
- **Section 4.2:** APT System
- **Section 4.3:** Direct Sounder Broadcast (DSB)
- **Section 4.4:** Data Collection and Location System

#### **Section 5:**

- **Section 5.0:** Tracking Procedures for Directional Antennas used to Acquire Data From Real-Time Transmissions System Sensors
- **Section 5.1:** TBUS Bulletin
- **Section 5.2:** Alternate Sources and Forms of Satellite Prediction Position Information

#### **Section 6:**

- **Section 6.0:** Ingest and Pre-processing
- **Section 6.1:** Ingest
- **Section 6.2:** Pre-processing
- **Section 6.3:** Calibration
- **Section 6.4:** Monitoring and Quality Assurance

#### **Section 7:**

- **Section 7.0:** Calibration of NOAA KLM Instruments

- **Section 7.1:** AVHRR
- **Section 7.2:** HIRS/3
- **Section 7.3:** AMSU-A and AMSU-B
- **Section 7.4:** SBUV/2
- **Section 7.5:** SEM-2
- **Section 7.6:** MHS [For NOAA-N and -P only]

## **Section 8:**

- **Section 8.0:** Level 1b Database
- **Section 8.1:** Data Representation and Storage
- **Section 8.2:** Level 1b Data Set Names
- **Section 8.3:** Data Distribution Formats

## **Section 9:**

- **Section 9.0:** NESDIS Operational Products
- **Section 9.1:** Sea Surface Temperature (SST) Products
- **Section 9.2:** Mapped GAC Products
- **Section 9.3:** Radiation Budget Products
- **Section 9.4:** Sounding Products (ATOVS and AMSU-B)
- **Section 9.5:** NOAA CoastWatch Products
- **Section 9.6:** Snow and Ice Products
- **Section 9.7:** Ozone (SBUV/2) Products
- **Section 9.8:** Aerosol/Optical Thickness Products
- **Section 9.9:** Comprehensive Large Array-data Stewardship System (CLASS)

## **Appendices:**

- **Appendix A:** APT Predict (TBUS) Bulletin
- **Appendix B:** Using Brouwer-Mean Elements from the TBUS Bulletin
- **Appendix C:** Polar Stereographic Earth Location Routines
- **Appendix D:** Miscellaneous Parameters for the Polar Orbiter Satellites
- **Appendix E:** Index of Internet Resources

- **Appendix F:** Ordering Retrospective Data
- **Appendix G:** Data Changes and Problem Record
- **Appendix H:** Orbit Injection
- **Appendix I:** Formulation of a Generic Algorithm for Earth locating data from NOAA Polar Orbiter Satellites
- **Appendix J:** Instrument Scan Properties

- **Appendix K:** Conversion of Blackbody Temperatures to AVHRR Radiances
- **Appendix L:** References
- **Appendix M:** Implementation of AMSU-B Correction Algorithm
- **Appendix N:** Software for Converting IBM Floating Point Numbers to IEEE Numbers
- **Appendix O:** Procedure for Scheduling AVHRR LAC Data
- **Appendix P:** Fundamental Constants

# **NOAA KLM USER'S GUIDE**

**with NOAA-N, N Prime, and MetOp SUPPLEMENTS**

## **Disclaimer**

While every effort has been made to ensure that this documentation is accurate and reliable, NOAA cannot assume liability for any damages caused by inaccuracies in the NOAA polar orbiter data or documentation, or as a result of the failure of the data or software to function in a particular manner.

The maintenance of this document has historically focused primarily on assuring file format descriptions, platforms, and instrument descriptions are current. Information regarding ground system configurations, data production systems and other information not related to understanding and using of the datasets themselves may not be current.

Phone numbers, fax numbers, physical addresses, e-mail addresses and Internet Uniform Resource Locators (URLs) are subject to change. NOAA makes no warranty, expressed or implied, nor does the fact of distribution constitute a warranty.

## **Acknowledgments**

The original version of the NOAA KLM User's Guide is based on the work done by Katherine B. Kidwell and has been frequently updated to reflect instrument changes, new platforms, additional products, as well as, changes to the processing, data access and archive procedures. Many thanks to the dedicated people within the offices of NOAA and NASA and to the various stakeholders, who have made this document an essential resource of information to thousands of users worldwide.

Again I wish to thank Kathy for the fine work that she did in maintaining and enlarging this document and in the support she gave me when I assumed her responsibilities.

Jeffrey M. Robel

## Acronyms and Abbreviations

A/D	Analog/Digital
AC	Alternating Current
ACF	Albedo Correction Factor
ADACS	Attitude Determination and Control Subsystem
ADE	Array Drive Electronics
AELDS	Advanced Earth Location Data System
AFGWC	Air Force Global Weather Central
AFSCN	Air Force Satellite Control Network
AFTN	Aeronautical Fixed Telecommunications Network
AGC	Automatic Gain Control
AGS	Ascent Guidance Software
AIP	AMSU Information Processor
AKM	Apogee Kick Motor
AM	Amplitude Modulation
AMSAT	Radio Amateur Satellite Corporation
AMSU	Advanced Microwave Sounding Unit
AMSU-A	Advanced Microwave Sounding Unit-A
AMSU-B	Advanced Microwave Sounding Unit-B
APT	Automatic Picture Transmission
ARIA	Advanced Range Instrumented Aircraft
ARS	Archive Retrieval System
asc	Ascending
ASCII	American Standard Coded Information Interchange
ASE	Available Solar Energy
ASR	Available Solar Radiation
ATMS	Advanced Technology Microwave Sounder
ATN	Advanced TIROS-N
ATOVS	Advanced TIROS Operational Vertical Sounder
AVHRR/3	Advanced Very High Resolution Radiometer Version 3
BCA	Battery charge Assembly
BIP	Band Interleaved by Pixel
BM	Brouwer Mean
bps	bits per second
BRDF	Bidirectional Reflectance Distribution Function
BRU	Battery Reconditioning Unit
BT	Brightness Temperature
BTX	Beacon Transmitter
C	Celsius or Centigrade
CAC	Climate Analysis Center
CCR	Cloud Cover Radiometer Contractor Change Request
CCS	Command and Control Subsystems
CCT	Computer Compatible Tape

ccw	counter clockwise
CD	Coefficient of Drag
CDA	Command and Data Acquisition
CDEM	Continuous dynode Electron Multiplier
CEMES	Centre d'Etudes de la Meteorologie Spatiale (France)
CEMSCS	Central EnvironMental Satellite Computer System
CGMS	Coordination Group for Meteorological Satellites
ch	channel
CIU	Control Interface Unit
CLASS	Comprehensive Large Array-data Stewardship System
CLAVR-x	Clouds from AVHRR Extended
CLW	Cloud Liquid Water
cm	centimeter
CMMD VER	Command Verification
CNES	Centre National D'Etudes Spatiales (France)
CODATA	Committee on Data for Science and Technology (International Council for Science)
CPC	Controls Power Converter
CPIDS	Calibration Parameters Input Data Sets
CSP	Calibration Start Pulse
CU	Control Unit
cw	clockwise
D/A	Digital/Analog
DACS	Data Acquisition and Control Subsystems
DAU	Decryption Authentication Unit
dB	decibel
dBm	decibels per milliwatt
dBW	decibels referenced to a watt
DC	Direct Current
DCS/2	Data Collection System/2
DDS	Data Distribution Server
desc	descending
DHS	Data Handling Subsystem
DIGB	Digital "B"
DMSP	Defense Meteorological Satellite Program
DOD	Department of Defense
DPD	DCS/SAR Processor Diplexer
DPSS	Data Processing and Services Subsystem
DPU	Data Processing Unit
Dr	Data Record
DRU	Data Recovery Unit
DSB	Direct Sounder Broadcast
DSN	Digital Signal (level) N
DTR	Data Transfer Rate
EAA	Equal Areas/Equal Aspect

EBCDIC	Extended binary Coded Decimal Interchange Code
ECAL	Electronic Calibration
ECF	Earth Centered Fixed (coordinate system)
EDR	Environmental Data Record
ELM	Electronics Module
ELT	Emergency Locator Transmitters
EMI	ElectroMagnetic Interference
eof	end of file
eor	end of record
EPIRB	Emergency Position Indicating Radio Beacon (located by SARSAT)
ERBE	Earth Radiation Budget Experiment
ESA	Earth Sensor Assemble ElectroStatic Analyzers
ESM	Equipment Support Module
ETSR	Extraterrestrial Solar Spectral Irradiance
EU	Electronic Unit Engineering Unit
EUMETSAT	European Organization for the Exploration of Meteorological Satellites
eV	electron volts
FGGE	First GARPE Global Experiment
FIFO	First In First Out
FM	Frequency Modulation
FNMOC	Fleet Numerical Meteorology and Oceanography Center (Navy)
FOV	Field of View
FRAC	Full Resolution Area Coverage
ftp	file transfer protocol
FW	Filter Wheel
FWHM	Full Width at Half Maximum
GAC	Global Area Coverage
GARP	Global Atmospheric Research Program
GCMD	Global Change Master Directory
GDO	Gunn diode Oscillator
GHA	Greenwich Hour Angle
GHz	Gigahertz
GMS	Geostationary Meteorological Satellite
GOES	Geostationary Operational Meteorological Satellite
GRT	Ground Reference Time
GTS	Global Telecommunications Service
GUI	Graphical User Interface
HIF	Historical Instrument File
HIRS/3	High Resolution Infrared Radiation Sounder Version 3
HRPT	High Resolution Picture Transmission

HTML	Hyper Text Markup Language
HV	High Voltage
HVPS	High Voltage Power Supply
Hz	Hertz
I/O	Input/Output
ICE	Inductosyn Control Electronics
ICT	Internal Cold Target
IF	Intermediate Frequency
IFC	In-Flight Calibration
IFOV	Instantaneous field of View
IMP	Instrument Mounting Platform
IMS	Ice Mapping System
IMU	Inertial Measurement Unit
in	inch
IPD	Information Processing Division
IR	Infrared
IRR	InterRange Ratio
ITT-A/CD	International Telephone and Telegraph – Aerospace/Communications Division
IWT	Internal Warm Target
JIC	Joint Ice Center
K	Kelvin
ka	kilo ampres
kbps	kilobits per second
keV	kilo electron Volts
kg	kilograms
kHz	kilo Hertz
km	kilometer
kpps	kilo pulses per second
KWBC	National Weather Service Telecommunications Gateway
LAC	Local Area Coverage
lbs	pounds
LED	Light Emitting Diode
LIFO	Last In First Out
LOS	Line of Sight Loss of Signal
LRC	Longitude Rotation Convention
LS	Level Sensor
LSB	Least Significant Bit
LSE	Land Surface Emissivity
LSP	Least Significant Portion
LST	Local Solar Time Land Surface Temperature
LUT	Local User Terminals
LVPS	Low Voltage Power Supply

LW	Long Wave
MASS	Microwave and Antenna Subsystem
max	maximum
mb	millibars
mbps	megabits per second
MDD	Meteorological Data Distribution
MDE	Motor Drive Electronics
MEPED	Medium Energy Proton and Electron Detector
MeV	Milli electron volt
MFP	Major Frame Pulse
MHS	Microwave Humidity Sounder
MHz	Mega Hertz
mi	mile
MIRP	Manipulated Information Rate Processor
MIRS	Microwave Integrated Retrieval System
mm	millimeter
mps	meters per second
mr	milliradian
MSB	Most Significant Bit
msec	microsecond
MSP	Most Significant Portion
MSPPS	Microwave Surface and Precipitation Products System
MSU	Microwave Sounding Unit
MTF	Modulation Transfer Function
mux	multiplexer
MW	microwave
N/A	Not Available
NASA	National Aeronautics and Space Administration
NCDC	National Climatic Data Center
NCEP	National Center for Environmental Prediction
NE $\Delta$ N	Noise Equivalent Radiance
NE $\Delta$ T	Noise Equivalent Delta Temperature
NESDIS	National Environmental Satellite, Data and Information Services
NH	Northern Hemisphere
NIC	National Ice Center
NIST	National Institute of Standards and Technology
nm	nanometers
NMC	National Meteorological Center
NPP	NPOESS Preparatory Project
NPOESS	National Polar-orbiting Operational Environmental Satellite System
NOAA	National Oceanic and Atmospheric Administration
NOAASIS	NOAA Satellite Information System
NODC	National Oceanographic Data Center

NOHRSC	National Operational Hydrologic Remote Sensing Center
NORAD	North American Air Defense Command (currently USSC)
NRZ-L	Non-return to sea level
NRZ	Non-return to zero
NWS	National Weather Service
OIG	Orbital Interest Group
OLR	Outgoing Longwave Radiation
OOPS	Operational Ozone Product System
ORA	Office of Research and Applications (NOAA/NESDIS)
OSDPD	Office of Satellite Data Processing and Distribution (NOAA/NESDIS)
OSPO	Office of Satellite and Product Operations
OSO	Office of Satellite Operations (NOAA/NESDIS)
OT	Optical Thickness
PACS	Polar Acquisition and Control System
PC37DF	Primary Component 37 Day File
PCB	Printed Control Board
PDPS	Polar Data Processing System
PEU	Processing Electronics Unit
PH37DF	Primary Histogram 37 Day File
PHD	Pulse Height Discriminators
PLLO	Phase Locked Loop Oscillators
PM	Phase Modulation
PMF	Product Master File
PMT	Photo Multiplier Tube
PMW	Position Mode Wavelength
pn	pseudo noise
POES	Polar Operational Environmental Satellite
Pps	Pulses per second
PROM	Programmable Read-Only Memory
PRT	Platinum Resistance Thermistors
PSB	Product Systems Branch
PSE	Power Supply Electronics
PSG	Polar Stereographic
PSU	Power Supply Unit
PWR	Power
QC	Quality Control
RAM	Random Access Memory
RAOB	Radiosonde Observation
RBPGS	Radiation Budget Product Generation System
RCE	Reaction Control Equipment
RCS	Reaction Control System
REF	Reference
RF	Radio Frequency
RFI	Radio Frequency Interference

rms, RMS	Root Mean Squared
ROM	Read Only Memory
rpm	revolutions per minute
RPU	Receiving and Power Unit
RSS	Reaction Support Structure
RTOVS	Revised TIROS Operational Vertical Sounder
RTTY	Radio Teletype
RWA	Reaction Wheel Assemblies
RWM	Read Write Memory
s/c	spacecraft
S/N	Signal to noise ratio
SA	Solar Array
SAA	Satellite Active Archive Solar Azimuth Angle
SAD	Solar Array Drive
SAIP	Stored AMSU Ingest Processing
SAR	Search and Rescue
SARP-2	Search and Rescue Processor-2
SARR	Search and Rescue Repeater
SARSAT	Search and Rescue Satellite Aided Tracking
SATCU	Solar Array Telemetry Commutator Unit
SBA	Spin Bearing Assembly
SBUV/2	Solar Backscatter Ultraviolet Version 2
SCF	Satellite Control Facility (USAF)
SDEV	Standard Deviation
SDR	Sensor Data Record
SEA	Solar Elevation Angle
sec	second
SEC	Space Environment Center
SEM-2	Space Environment Monitor Version 2
SGP4	Simplified General Perturbation
SH	Southern Hemisphere
SLA	Search and Rescue L-Band Antenna
SM	Sensor Module
SMSO	Sweep Mode Solar Observations
SOA	S-Band Omni Antenna
SOCC	Satellite Operations Control Center
SPN	Shared Processing Network
SPU	Signal Processing Unit
sr	steradian
SRA	SAR Receiver Antenna
SSB	Satellite Services Branch (NCDC)
SSBUV	Space Shuttle SBUV
SSD	Satellite Services Division Solid State Detector

SSM/T2	Special Sensor Microwave/Water Vapor Profiler
SSM/T	Special Sensor Microwave/Temperature
SSM/I	Special Sensor Microwave/Imager
SSP	Sub-Satellite Point
SST	Sea Surface Temperature
SSU	Stratospheric Sounding Unit
STAR	Center for Satellite Applications and Research
STIP	Stored TIROS Information Processing
STU	Scan Timing Unit Standard Time Unit
STX	Station Transmission Assembly
SUBCOM	subcommutator
SW	Short Wave
SWE	Snow Water Equivalent
SZA	Solar Zenith Angle
TARM	TIROS Atmospheric Radiance Module
T/V	Thermal/Vacuum
TBD	To Be Determined
TBUS	TIROS Bulletin United States
TCE	Thermal Control Electronics
TCS	Thermal Control Systems
TDR	Temperature Data Record
TED	Total Energy Detector
TIP	TIROS Information Processor
TIROS	Television Infrared Observation Satellite
TLE	Two-line Element
TLM	Telemetry
TOVS	TIROS Operational Vertical Sounder
TPW	Total Precipitable Water
TU	Transport Units
UDA	UHF Data Collection System Antenna
UEF	User Ephemeris File
UHF	Ultra High Frequency
URL	Uniform Resource Locator
USAF	United States Air Force
USO	Ultra Stable Oscillator
USSC	U.S. Space Command (formerly NORAD)
UTC	Coordinated Universal Time (same as GMT)
UV	Ultraviolet
V/C	Vector Control
V	Volt
VAFB/WR	Vandenberg Air Force Base/Western Range
VCO	Voltage Controlled Oscillator
VDC	Volts DC
VHF	Very High Frequency

VHRR	Very High Resolution Radiometer
VIS	Visible
VPD	Vacuum Photo Diode
VRA	VHF Real-time Antenna
VS	Variable block Span (IBM)
VTF	Vacuum Test Fixture
VTX	VHF Real-time Transmitter
W	watts
WEFAX	Weather Facsimile (from meteorological satellites)
WLC	Wavelength Calibration
WMO	World Meteorological Organization
WR	Western Range Work Request
WWW	World Wide Web
XBT	Expendable Bathythermograph
XSU	Cross Strap Unit

## **NOAA-N, -N Prime Supplement**

**Below is a summary of format changes for the NOAA-N and N Prime spacecrafts.**

When NOAA-N (NOAA-18) was launched a number of changes were made to the data formats; necessitated by the replacement of AMSU-B with the Microwave Humidity Sounder (MHS), the replacement of HIRS/3 with HIRS/4, and changes in the direct readout formats. All effort was made to keep the changes to a minimum.

These changes to the NOAA Level 1b formats were implemented on January 25, 2005, and was applied to all satellite (NOAA-15, -16, -17, and 18) from that date forward. The format changes were known as version 3.

Part of the updates to the NOAA-N and N Prime Level 1b formats is the inclusion of additional or secondary header records. These header records contain ancillary dataset names and any metadata needed for data reprocessing. Software applications should use the "Count of Header Records in the Data Set" field, located in the first or primary header record to calculate the position of the first data record and skip the secondary header records.

The following sections in the NOAA KLM User's Guide provide the user with detailed information on the specific changes.

1) Microwave Humidity Sounder (MHS) instrument replaced the AMSU-B

Section 3.9 describes the MHS instrument

Section 7.6 describes calibration procedures for MHS

Section 8.3.1.9 describes the MHS Level 1b format

2) HIRS/4 instead of HIRS/3 instrument

Section 3.2 (originally describing HIRS/3 only) has been modified to accommodate HIRS/4 description.

Section 8.3.1.5 describes the Level 1b data set structure for HIRS/3 and HIRS/4.

3) AVHRR changes

Section 8.3.1.1 describes the Level 1b data set structure.

Section 8.3.1.3 describes the AVHRR/3 Level 1b dataset format for LAC/HRPT.

Section 8.3.1.4 describes the AVHRR/3 Level 1b dataset format for GAC.

4) Advanced DCS (A-DCS) changes

Section 3.6 (originally describing DCS) has been modified to include A-DCS for NOAA-N Prime.

5) Direct Readout formats

Section 4.1.2 describes the transmitter frequency and website which provides latest information on individual POES spacecraft.

Section 4.1.3.2 describes the HRPT Minor frame format for NOAA-N,-N Prime

## 1.0 INTRODUCTION TO THE NOAA KLM SYSTEM

The National Oceanic and Atmospheric Administration (NOAA) and the National Aeronautics and Space Administration (NASA) jointly administer the civilian polar orbiting spacecraft system for the United States. Upon successful achievement of orbit, NASA conducts an engineering evaluation and checkout of each satellite. During the instrument turn-on checkout period, the NASA team directs the satellite, and obtains and analyzes engineering data necessary to the evaluation. Upon completion of testing, the satellite is turned over to NOAA for routine operational control.

In the Spring of 1998, a new series of NOAA Polar Operational Environmental Satellites (POES) commenced with the launch of NOAA-K (NOAA-15) and ended with NOAA-N Prime (NOAA-19). This series, represented an improvement over the previous series of NOAA polar-orbiting satellites which began with TIROS-N (launched in October 1978), and continued with NOAA-6 through NOAA-14 (launched in December 1994).

In order to eliminate redundancy for NOAA's POES satellite data users, the documents *NOAA Polar Orbiter Data User's Guide*, the *NOAA Technical Memorandum NESS 95 (The TIROS-N, NOAA A-G Satellite Series)*, the *NOAA Technical Memorandum NESS 107 (Data Extraction and Calibration of TIROS-N/NOAA Radiometers)* and the *TIROS-N Series Direct Readout Services Users Guide* were combined into one document. The contents of this document, originally titled *NOAA KLM User's Guide* include information to the NOAA-K, -L, -M system with additions made as newer satellites were launched, namely, NOAA-N and NOAA-N Prime and the European Metop satellites, Metop-1 and Metop-2. These also carry the AVHRR and ATOVS instruments. The information within this document include descriptions of the spacecraft characteristics, orbital considerations, sensor package, calibration, and formats for Level 1b data and selected operational products. Due to limited resources in maintaining this large document over the years some of the information that is deemed not contingent to the understanding of the data and products themselves remains in its original form. This includes tracking procedures to acquire data from real-time transmission, systems sensors, ingest and preprocessing. Questions related to any information within this document should be directed to [NCDC.satorder@noaa.gov](mailto:NCDC.satorder@noaa.gov).

### 1.1 THE NOAA KLM CONCEPT

The NOAA KLM POES satellites began a new era of improved environmental monitoring in support of NOAA missions. The instrument payload has significant improvements and additions/deletions. The instrument changes have affected the spacecraft subsystems and data formats.

The NOAA KLM satellites include improvements to instruments that are evolutionary and significant. The initial concept was to add more passive microwave instruments and channels in place of the four channel Microwave Sounding Unit (MSU) and the three channel Stratospheric Sounding Unit (SSU). During the satellite system design process, it became evident that the increased size, fields of view, and power requirements for the new instruments would have significant impacts on the spacecraft power, data handling, and attitude control systems. The NOAA KLM spacecraft were significantly heavier than previous spacecraft (2231.7 kg versus 1712.3) and required a more powerful Apogee Kick Motor (AKM) solid rocket booster and expendable launch vehicle, TITAN-II, to obtain orbit. Combined with command system security and frequency changes, NOAA KLM satellites look very much like previous satellites to the casual observer, but have significant changes to essentially every subsystem. To meet the

increased power requirements, two additional solar panels have been added and the solar array has about 45% more output. The batteries, propulsion tank capacity, the size of the reaction wheels and magnetic coils used for momentum unloading and attitude control have also increased in capacity. The spacecraft structure has been stiffened primarily to support the heavier AMSU instruments and improve launch vehicle load margins. Several antennas have been relocated and/or built with new materials and processes to improve performance. Flight computer memory has been doubled and the flight software modified to meet new requirements.

The Advanced Microwave Sounding Units (AMSU-A1, AMSU-A2, and AMSU-B) are state-of-the-art passive microwave sounders that will significantly enhance NOAA's atmospheric sounding and non-sounding products suite. AMSU is expected to improve global sounding (especially in the presence of clouds), water vapor profiles and information on precipitation and ice. The AMSU instruments have better spatial resolution and upper atmospheric sounding capabilities than the previous MSU instrument flown on the TIROS-N series.

The Advanced Very High Resolution Radiometer (AVHRR/3) provides spectral and gain changes to the visible channels that will allow improved low energy/light detection and adds a sixth channel, called 3A, at 1.6 microns for improved snow and ice discrimination. Scan mechanism lifetime and jitter performance have been improved with changes to lubricants, motors and bearings. A fairly large external sun shield has been added to the AVHRR/3 scan motor housing to reduce sunlight impingement and associated calibration problems that have been briefly observed during some prior missions. Channel 3A will be time shared with the previous 3.7 micron channel, now called channel 3B.

The first half of the dynamic range for AVHRR/3 channels 1 and 2 represents 0 to 25% albedo while channel 3A has the first half of its dynamic range used for detection of albedo level changes from 0 to 12.5% albedo. These are referred to as dual slope or split gains. Previous AVHRR instruments used one linear calibration equation for each visible channel and now two are required for each visible channel. NOAA will be monitoring the dual slopes of the ramp calibrations more closely to assure that the linearity of the electronics and inflection points for the dual slopes do not change as the instrument ages or with other factors such as temperature, orbital or seasonal effects. The new visible channel ramp calibrations do not use the full dynamic range as was done previously and have been observed to change slightly as the instrument temperature changes.

The Automatic Picture Transmission (APT) user sees channel 3B as channel 6 using the wedge six grey scale modulation index.

The AMSU instruments required the addition of a new spacecraft data processing box called the AMSU Information Processor (AIP) and changes to the High Resolution Picture Transmission (HRPT), Local Area Coverage (LAC), and Global Area Coverage (GAC) formats to accommodate the new AMSU data. The AIP receives data from AMSU-A1, AMSU-A2, and AMSU-B at a combined data rate of 7.2 kbps and from the TIROS Information Processor (TIP) at 8.32 kbps. The AIP generates three data streams: (1) AMSU data only which is sent to the MIRP for merging into HRPT, Local Area Coverage (LAC) or recorded HRPT, and Global Area Coverage (GAC); (2) combined AMSU/TIP sent to the spacecraft Cross-Strap Unit (XSU) for tape recording if needed; (3) AMSU/TIP for direct transmission from the XSU. The HRPT is still broadcast at the old data rate of 665.5 kbps with the new AMSU data replacing what were previously spare words. Note that if the non-redundant MIRP was to fail, it would still be possible for NOAA to obtain global sounding data. Also note that Direct Sounder Broadcast (DSB) of TIP data does not include AMSU data. DSB users will have access to HIRS/3, DCS-2, SEM-2, and SBUV/2 data as defined in the new TIP format. Most of the previously used or spare TIP words now contain DCS-2 data to satisfy the growing needs of Data Collection System (DCS) users.

The High Resolution Infrared Radiation Sounder (HIRS/3) has spectral channel changes that were made primarily to improve soundings and to be congruent with the specifications developed for the GOES-I through -M Sounders. The HIRS/3 cooler set point was decreased to approximately 100K which will improve the two infrared detectors' performance. The HIRS/3 scan profile was also changed to eliminate the viewing of the second/cold blackbody internal calibration target from the automatic calibration sequence and to use the additional time to perform another scan (38 total scans per calibration sequence) of the earth. It was cost effective to leave the second calibration target in the instrument and leave its viewing as a commandable option. The HIRS/3 instrument has been improved for longer lifetime and produces lower noise levels (better NEDN performance).

The Space Environment Monitor (SEM-2) has improved calibration and particle detection capabilities. The Total Energy Detector (TED) measures to a lower energy of 0.05 KeV and the TED integral F (ALPHA) has two ranges of 0.05 to 1 and 1 to 20 KeV. The Medium Energy Proton and Electron Detector (MEPED) has a fourth Omni directional proton measure at 140 MEV. The MEPED has a new fixed mounting on the spacecraft and the TED has also been relocated to maximize particle detection abilities.

The Solar Backscatter Ultra Violet Spectral Radiometer (SBUV/2) has undergone relatively modest improvements. Its Programmable Read Only Memory (PROM) will be changed to a Random Access Memory (RAM) due to parts obsolescence and to provide more operational flexibility. The grating drive system has been improved to provide more torque margin. The diffuser angle was changed 9 degrees to improve the accuracy of radiometric data in the Irradiance mode. Range 3 data is provided from the PMT anode. The SBUV/2 is planned for afternoon missions only and is not presently planned for flight on NOAA-K although NOAA-K was tested with it and can be launched into either orbit.

The Data Collection System (DCS) data rate increased from 1200 to 2560 bps and the number of Data Recovery Units (DRUs) doubled from 4 to 8. DCS-2 bandwidth increased from 24 KHz to 80 KHz.

The Search and Rescue Processor (SARP-2) Data Recovery Units increased from 2 to 3 to handle more global distress messages and to better detect interfering signals. SARP output message formats are significantly different and commandable capability exists to issue pseudo messages for improved isolation of interfering signals from the ground.

Efforts have been made to improve reliability and performance while minimizing cost and impacts to users of POES satellite data. While the POES satellites may superficially appear to be production line copies, they have all been uniquely different. NOAA KLM era marked significant evolutionary and revolutionary improvements to NOAA's abilities to satisfy its multifaceted environmental monitoring and prediction missions.

## 1.2 NOAA KLM SPACECRAFT CHARACTERISTICS

The primary mission was to design, fabricate, integrate, test and launch five operational NOAA polar-orbiting satellites into Sun-synchronous orbits. These satellites are designated NOAA-K, L, M, N, N'. NOAA KLM mission characteristics are shown in Table 1.2-1.

<b>Table 1.2-1. Mission Characteristics.</b>	
<b>Item</b>	<b>NOAA KLM Specifications</b>
Launch Date	NOAA-K (NOAA-15): May 13, 1998 NOAA-L (NOAA-16): September 21, 2000 NOAA-M (NOAA-17): June 24, 2002 (mid morning orbit) NOAA-N (NOAA-18): May 20, 2005 NOAA-N' (NOAA-19): Feb 6, 2009
Mission Life	2 years minimum required
Orbit	Sun-synchronous, 833 ± 19 km or 870 ± 19 km
Launch Vehicles	U.S. Air Force (USAF) Titan II
<b>Spacecraft – Operational</b>	
Mass	1478.9 kg on orbit/2231.7 kg at launch
Length/Diameter	4.18 m / 1.88 m
Propulsion	Mono propellant hydrazine, GN <sub>2</sub> and AKM
Attitude Control	3-axis stabilized
Power	Direct energy transfer
Thermal	Passive and active controls
<b>Data Rates -Real Time</b>	
TIROS Information Processor (TIP)	8.32 kilobits per second (kbps) includes low rate instrument (except AMSU) and spacecraft housekeeping and can be recorded
High Resolution Picture Transmission (HRPT)	665.4 kbps includes all instrument data and spacecraft housekeeping and can be recorded.
Automatic Picture Transmission (APT)	Approximately 2 kHz medium resolution imagery from two selected AVHRR sensor channels.
<b>Data Rates – Recorded</b>	
Global Area Coverage (GAC)	665.4 kbps include low-rate instrument, spacecraft housekeeping and medium resolution imagery.

Local Area Coverage (LAC)	665.4 kbps HRPT except the data field is randomized to record.
Playback	2.66 Megabits per second (mbps) during normal operations.
<b>Ground System*</b>	
Operation Control	NOAA/SOCC CDA stations at Wallops and Fairbanks. DSN 26-m and AFSCN for contingency support.
Forward Data Link	S-band command uplink encrypted.
Return Data Link	Housekeeping telemetry from HRPT and GAC downlinks.
Science Data Capture	Tape playback direct to CDA (typically eleven 12-minute contacts per day), relayed to the NOAA/DDS in Suitland, MD.
Science Data Processing	NOAA/DDS, Air Force Global Weather Central (AFGWC), International Weather Services and ARGOS

\*at time of NOAA-K launch

The spacecrafts were all launched from the Vandenberg Air Force Base in California using modified, standardized Titan and Delta II launch vehicles and each spacecraft mission was required to be compatible with the existing NOAA ground system.

Reliability and continuous high performance were of utmost importance during the design process for the NOAA KLM satellites, and, just as importantly, the KLM satellites were required to provide continuity to the NOAA polar-orbiting observing system to ensure continuity in the extending the essential climate records for long term climate change studies.

Each spacecraft was designed to meet all on-orbit performance requirements for a minimum period of two years.

NASA played an important role in the design and build out of each satellite. Upon successful achievement of orbit, NASA conducted engineering evaluation and checkout of each satellite. Upon completion of testing, each satellite was turned over to NOAA for routine operational control. During the NOAA operational period, the POES Project's responsibility was limited to investigation of spacecraft on-orbit anomalies upon NOAA's request. Figure 1.2-1 provides a NOAA KLM System Functional Diagram.

### 1.2.1 SPACECRAFT STRUCTURE

The NOAA KLM spacecraft structure, based on the NOAA-H, I, J integrated structure, is designed to support a complete meteorological payload plus the necessary support subsystems to meet all interface and system requirements. The structure comprises four major assemblies: the Instrument Mounting Platform (IMP), the Equipment Support Module (ESM), the Reaction Control Equipment (RCE), Reaction Support Structure (RSS), and the Solar Array (SA) assembly. Figure 1.2.1-1 provides a line drawing of the NOAA KLM spacecraft and Table 1.2.1-1 summarizes the primary physical characteristics.

Figure 1.2-1. NOAA KLM System Functional Design

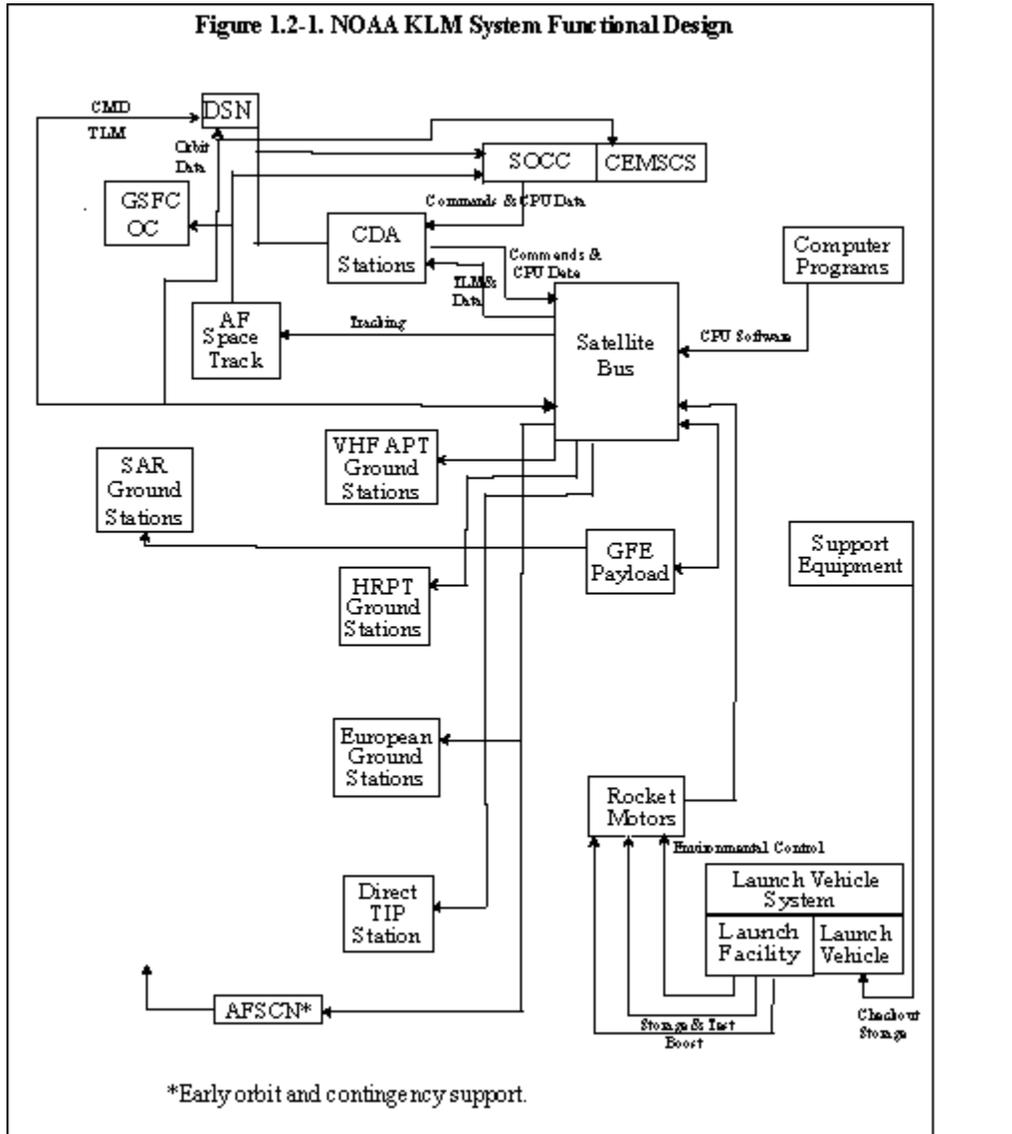

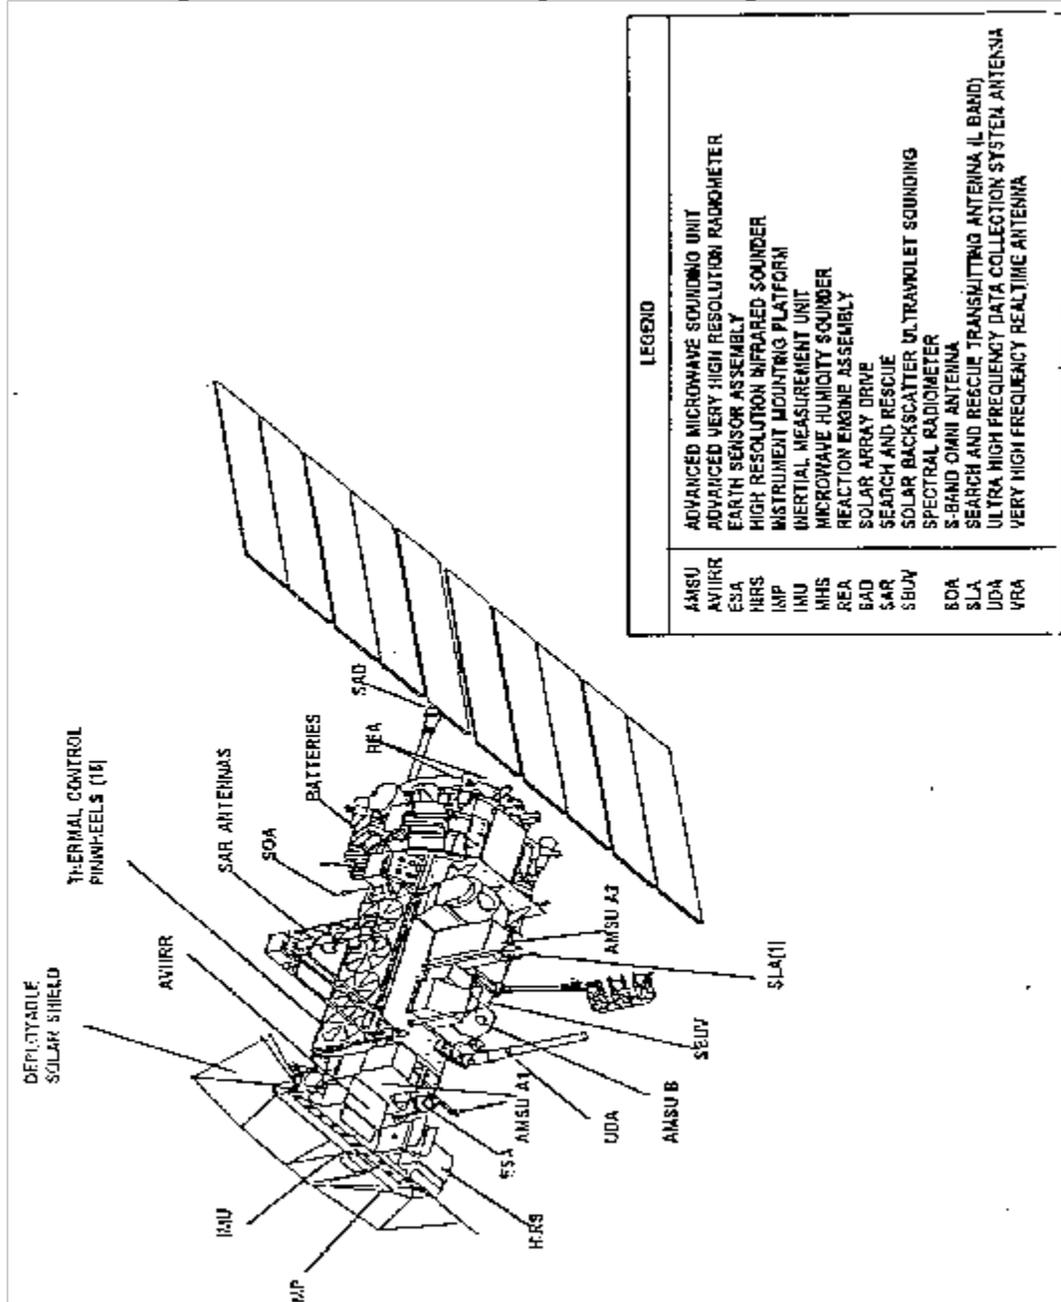

Figure 1.2.1-1 NOAA KLM Spacecraft Configuration.

<b>Table 1.2.1-1. NOAA KLM Physical Characteristics.</b>	
<b>Parameter</b>	<b>NOAA KLM Characteristics</b>
<b>General</b>	
Configuration	3-axis body stabilized
Mission	2-years
Launch Vehicle	Titan II
<b>Spacecraft Size</b>	
Launch Configuration Envelope Expendable Launch Vehicle Static Envelope	2540 mm (100 in)
Fairing Diameter	3048 mm (120 in)
<b>On-Orbit Configuration</b>	
Main Body Length	4.2 m (13.75 ft)
Main Body Diameter	1.88 m (6.2 ft)
Array to Body	3.2 m (10.5 ft)
Overall Length	7.4 m (24.2 ft)
<b>Spacecraft Mass (Titan II)</b>	
Dry Satellite	1478.9 kg (3260.3 lb)
Propellant and pressurant	752.8 kg (1659.7 lb)
Total Deployment Weight	2231.7 kg (4920 lb)

#### 1.2.1.1 Instrument Mounting Platform

The HIRS and AVHRR instruments are mounted on the Instrument Mounting Platform (IMP) because of stringent pointing requirements and/or the need for an uninterrupted view of space for detector-cooling purposes. The IMP also supports the primary attitude-sensing equipment: namely, an Earth horizon sensor, an inertial measurement unit and a Sun sensor. Overall, the approach achieves an instrument optical-axis pointing accuracy of better than 0.2 degrees relative to the local vertical. The surface of the IMP is the primary thermal control surface for the instruments. It houses an array of thermal control louvers, protected from solar illumination in mission orbit by a sunshade.

#### 1.2.1.2 Equipment Support Module

The ESM contains the majority of the satellite electronic support equipment. It is pentagonal in cross section but asymmetric to provide a large Earth-viewing face upon which lower pointing accuracy instruments and antennas are mounted. Internal of the ESM are mounted most of the components contained in the data handling, attitude determination and control, communications, and command and control subsystems, as well as the SARR, SARP, and DCS instruments. External to the ESM, on the Earth facing surface, are mounted the AMSU-A1, AMSU-A2, AMSU-B, SBUV, as well as the communication system antennas. One segment of the mounting area, at the lower end of the module, is primarily dedicated to SAR equipment. Thermal control of the ESM itself is provided by thermal blankets and pinwheel louver assemblies integral to the side panels.

1.2.1.3 Reaction Control Equipment Support Structure

The RSS is a circular cylinder, which primarily supports a solid rocket AKM plus the Reaction Control Equipment (RCE) components consisting of two nitrogen tanks, two hydrazine tanks, four hydrazine thrusters, and eight nitrogen thrusters along with the valves and manifolding required to inter-connect the system. In addition to the propulsion equipment, the RSS supports the satellite batteries, battery charge controllers (for thermal reasons these items are outside the

<b>Table 1.2.1.3-1. Government-furnished Satellite Equipment List.</b>

SARR	X	X	X
SBUV/2		X	
AMSU-A1	X	X	X
AMSU-A2	X	X	X
AMSU-B	X	X	X

#### 1.2.1.4 Solar Array

The SA consists of ten reinforced honeycomb panels, which are hinged to each other along their long edges. When deployed, the array is approximately 6.15 m (242 in) long by 2.73 m (107.5 in) wide. During launch, solar array panels are stowed on the ESM back apex panels. During mission mode, the array is supported from the RSS through the long boom, the solar array drive, the short boom and the mast. The array is canted 22 or 36 degrees from the short boom via the cant-deployment mechanism, located between the short boom and the mast.

#### 1.2.1.5 Spacecraft/Launch Vehicle Interface

The NOAA KLM spacecraft used modified, standardized Titan II launch vehicles. A two-piece conical ring (the payload adapter), furnished by the spacecraft contractor, provided the mechanical interface between the spacecraft and the launch vehicle.

### 1.2.2 INSTRUMENT PAYLOAD (GENERAL DESCRIPTIONS)

#### 1.2.2.1 Earth Imaging

The AVHRR/3, a six-channel scanning radiometer, views the same Earth area with each channel. The data acquired during each scan allows, after ground processing, multispectral analysis of hydrologic, oceanographic, land use and meteorological parameters. Data from channels 1, 2, and 3A are used to monitor reflected energy in the visible and near-IR portions of the electromagnetic spectrum. These data provide means to observe vegetation, clouds, lakes, shorelines, snow, aerosols and ice. Data from channels 3B, 4 and 5 are used to determine the radiative energy from the temperature of the land, water, and sea surface as well as the clouds above them. Only five channels can be transmitted simultaneously, channels 3A and 3B being respectively switched for day/night operation and as determined by operational requirements for the afternoon satellite, while 3B will be on continuously for the morning satellite mission. For the first time, Channels 1, 2 and 3A on these spacecraft have incorporated the low light split-gain provision, providing better resolution in a portion of the radiance range. The Automatic Picture Transmission (APT) mode, using two selected channels, produces a more geometrically linear scan line but at the reduced resolution of 4 km. Table 1.2.2.1-1 lists the six channels and their required spectral, spatial and thermal resolution (where appropriate). For more information on the AVHRR/3 instrument, see

Section 3.1.

<b>Table 1.2.2.1-1. AVHRR/3 Channels</b>			
<b>Channel</b>	<b>Spectral Bandpass (micrometers)</b>	<b>Spatial Resolution at nadir (km)</b>	<b>Signal to Noise (S/N) or Noise Equivalent Delta Temperatures (NEAT)</b>
1 (Visible)	0.580 - 0.68	1.1	9:1 at 0.5% Albedo
2 (Near IR)	0.725 - 1.00	1.1	9:1 at 0.5% Albedo
3A (Near IR)	1.580 - 1.64	1.1	20:1 at 0.5% Albedo
3B (IR-Window)	3.550 - 3.93	1.1	0.12 K at 300 K
4 (IR-Window)	10.300 - 11.3	1.1	0.12 K at 300 K
5 (IR-Window)	11.500 - 12.5	1.1	0.12 K at 300 K

1.2.2.2 Atmospheric Sounding Instruments

Three instruments are used to determine radiance needed to calculate the atmospheric temperature and humidity profiles from the earth's surface to the stratosphere. These instruments are the High-Resolution Infrared Sounder/3 (HIRS/3), the Advanced Microwave Sounding Unit-A (AMSU-A) and the Advanced Microwave Sounding Unit-B (AMSU-B) for NOAA KLM.

The HIRS/3 has twenty spectral bands, nineteen in the IR band and one in the visible band. This instrument is basically the same as the instrument flown on earlier spacecraft, except for five spectral band changes to improve sounding parameter accuracy. The instrument measures scene radiance in nineteen channels to permit calculation of the vertical temperature profile from the Earth's surface to about 40 km. The instrument scans  $\pm 49.5$  degrees, having a ground resolution (nadir) of 17.4 km, 56 instantaneous fields of view (IFOV) for each 2250-km scan line at 6.4 seconds per scan line and 42 km between IFOV's along-track (nadir). See Section 3.2 for the required wavelength, half-power bandwidth and noise power requirements for the HIRS/3.

The AMSU-A is a total power radiometer and a line scan instrument designed to permit the calculation of the vertical temperature profile from the Earth's surface to about a 2-millibar pressure height 45 km (28.0 mi). Vertical profiles are obtained through the measurements of scene radiance in fifteen channels, ranging from 23.8 to 89 GHz. The instrument has an instantaneous field-of-view of 3.3 degrees at the half-power points. The antenna provides a cross-track scan, scanning  $\pm 50$  degrees from nadir with a total of 30 Earth fields of view per scan line. Each Earth field of view is separated from the adjacent cell along the scan direction by  $3\frac{1}{3}$  degrees. Spatial resolution at nadir is nominally 50 km (31.0 mi). See Section 3.3 for more details on AMSU-A.

The AMSU-B is a line scan instrument designed to allow the calculation of the vertical water vapor profiles from the Earth's surface to about a 20-millibar pressure 12 km (7.5 mi). Vertical profiles are obtained through the measurements of scene radiance in five channels, ranging from 89 to 183 GHz. AMSU-B, like the AMSU-A, is a total power radiometer and uses two target temperatures to provide for accurate radiance calibration with each scan. The instrument has an

instantaneous field-of-view of 1.1 degrees at the half-power points. The antenna provides a cross-track scan, scanning of  $\pm 49.5$  degrees from nadir with a total of 90 Earth fields of view per scan line. Each Earth field of view is separated from the adjacent cell along the scan direction by 1.1 degrees. Spatial resolution at nadir is nominally 16.7 km (10.4 mi). AMSU-B contains four water vapor channels (channels 17 through 20 inclusive) and one window channel (channel 16). AMSU-A channel 15 and AMSU-B channel 16 share the same atmospheric window band. See Section 3.4 for more details on AMSU-B.

### 1.2.2.3 Solar Backscatter Ultraviolet Radiometer (SBUV)

The SBUV/2 is a non-spatially scanning, spectrally scanning sounding radiometer. It is designed to measure scene radiance and solar spectral irradiance in the spectral range from 160 to 406 nanometers (nm). In the discrete mode, measurements are made in 12 spectral bands from which the total ozone and vertical distribution of the ozone are deduced. The sweep mode provides a continuous spectral scan from 406 to 160 nm that is used primarily for solar spectral irradiance measurements. The half power FOV is 11.33 degrees or 172 km (106.9 mi). Spectral characteristics are described in Table 1.2.2.3-1.

<b>Table 1.2.2.3-1. SBUV/2 Spectral Characteristics (Discrete Mode)</b>		
<b>Step Number</b>	<b>Central Wavelength (nm)</b>	<b>Bandwidth (nm)</b>
1	252.00 $\pm 0.05$	1 + 0.2, -0
2	273.61 $\pm 0.05$	1 + 0.2, -0
3	283.10 $\pm 0.05$	1 + 0.2, -0
4	287.70 $\pm 0.05$	1 + 0.2, -0
5	292.29 $\pm 0.05$	1 + 0.2, -0
6	297.59 $\pm 0.05$	1 + 0.2, -0
7	301.97 $\pm 0.05$	1 + 0.2, -0
8	305.87 $\pm 0.05$	1 + 0.2, -0
9	312.57 $\pm 0.05$	1 + 0.2, -0
10	317.56 $\pm 0.05$	1 + 0.2, -0
11	331.26 $\pm 0.05$	1 + 0.2, -0
12	339.89 $\pm 0.05$	1 + 0.2, -0

Cloud Cover Radiometrics	379.00 ±1	3 + 0.3
--------------------------	-----------	---------

#### 1.2.2.4 Space Environment Monitor (SEM)

The SEM-2 provides measurements to determine the intensity of the Earth's radiation belts and data on charged particle precipitation phenomena in the upper atmosphere resulting from solar activity. It provides warnings of solar occurrences that may impair long-range radio communication or high-altitude manned operations.

The SEM-2 consists of two separate sensor units and a common Data Processing Unit (DPU). The sensor units are the Total Energy Detector (TED) and the Medium Energy Proton and Electron Detector (MEPED). Performance characteristics are given in Table 1.2.2.4-1.

The TED uses eight programmed swept electrostatic curved-plate analyzers to select particle type and energy and Channeltron detectors to sense and quantify the intensity in the sequentially selected energy bands. The particles of interest have energies ranging from 50 electron volts (eV) to 20 KeV.

The MEPED senses protons, electrons and ions with energies from 30 KeV to several tens of MeV. The MEPED is a collection of four directional solid-state detector telescopes and four "generally omnidirectional" sensors.

Accumulators are located in the DPU to sort and count the events. The processed data are multiplexed and fed to the satellite telemetry system.

The SEM-2 data are separated from the other data by NOAA/NESDIS and, along with orbital element data, are sent to the Space Environment Center (SEC) in Boulder, Colorado for processing.

<b>Table 1.2.2.4-1. SEM-2 Characteristics.</b>			
<b>SEM-2 Units</b>	<b>Performance Requirements</b>	<b>Energy Levels</b>	<b>Field of View</b>
TED	Determine heat energy input into upper atmosphere from absorption of electrons, protons and positive ions.	Electrons: 0.05 KeV to 20 KeV Protons: 0.05 KeV to 20 KeV	Two at 15 degrees full angle, -x, -x + 30 degrees

MPED	Same as TED	Electrons: 30 keV V to 700 keV V Protons: 30 keV V to 6900 keV V Above ?16, >35, >70, >140 MeV	15 degrees full angle -x, -x +90 degrees 15 degrees full angle -x, X + 90 degrees 120 degrees full angle, -x
DPU	Combine outputs into a 2-second, 40 word format. Provide command, calibrate and timing interfaces.		
Summary (Maximums)	Mass: 5 kg Power: 10 watts Volume: 0.0186 m <sup>3</sup> Telemetry: Two (8-bit) words/TIP minor frame		

#### 1.2.2.5 Search and Rescue Satellite Aided Tracking System

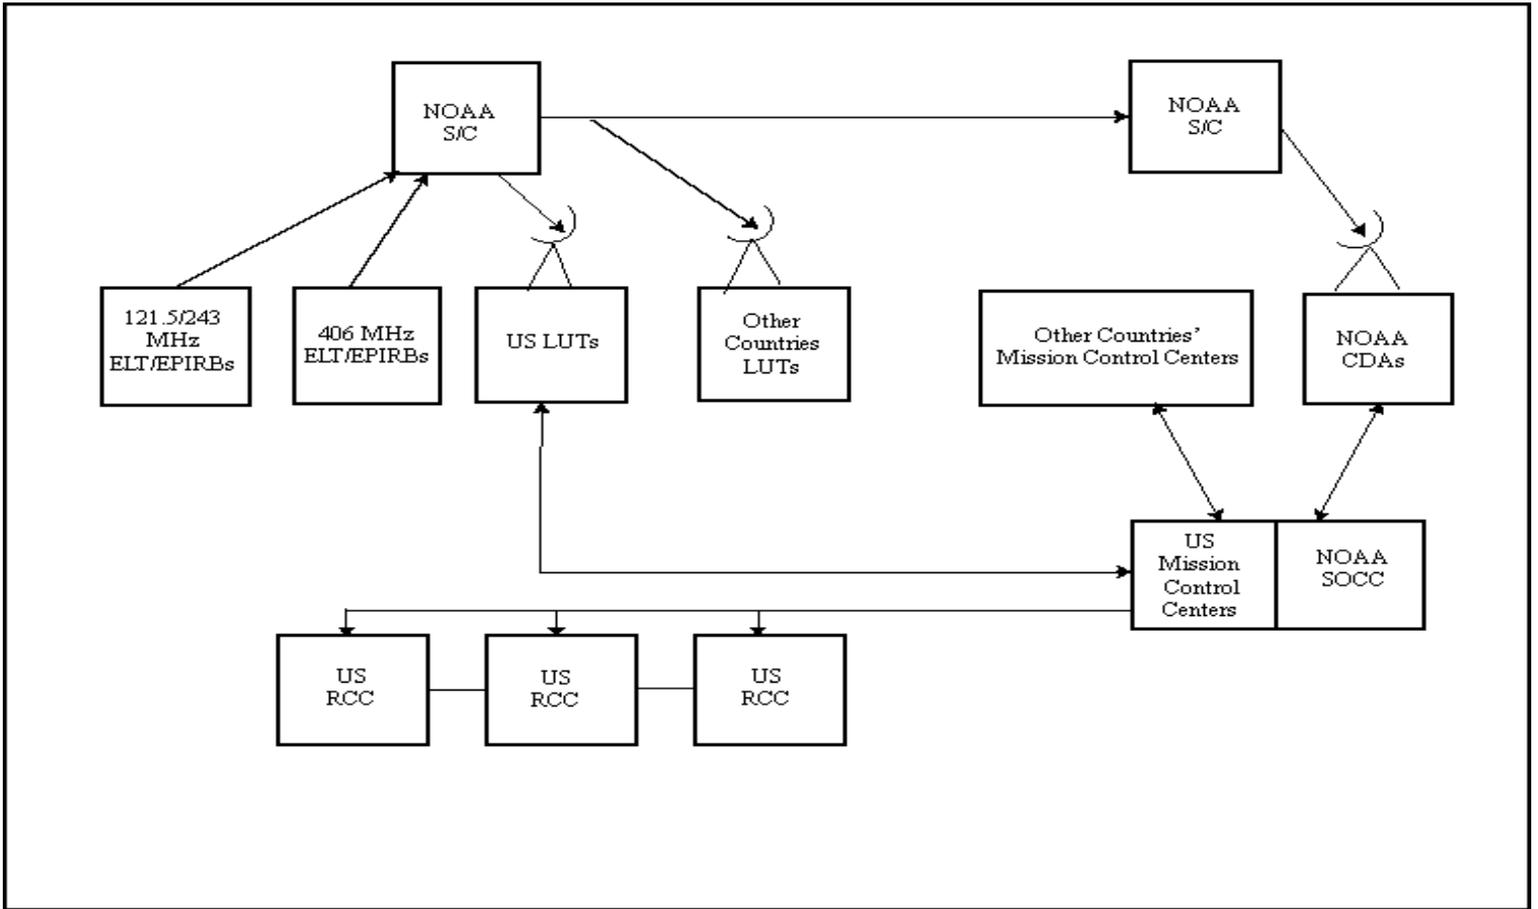

The SARSAT system is designed to detect and locate Emergency Locator Transmitters (ELTs) and Emergency Position-Indicating Radio Beacons (EPIRBs) operating at 121.5, 243, and 406.05 MHz. Figure 1.2.2.5-1 illustrates the SARSAT concept.

The SAR instrumentation on the NOAA KLM satellites comprises two elements, the SARR and the SARP-2. Table 1.2.2.5-1 summarizes the SARSAT instrumentation characteristics.

<b>Table 1.2.2.5-1. SARSAT Subsystem Characteristics.</b>	
<b>Spacecraft Repeater (121.5, 243 and 406 MHz):</b>	
<b>Parameter</b>	<b>Specification</b>
<b>Bandwidths (Doppler shift + drift + tolerance + guard band)</b>	
121.5 MHz	25 kHz
243 MHz	46 kHz
406.050 MHz	100 kHz
Transmitter Power (1,544 MHz)	8 W decibels referenced to a watt (dBW)
<b>Physical Characteristics:</b>	

Weight	24 kg
Size	0.034 m <sup>3</sup>
Power	53 W
<b>Spacecraft 406 MHz Processor:</b>	
Maximum Bandwidth	80 kHz
Storage Capacity	324 kb
Output Data Rate (via Telemetry)	2.4 kbps
<b>Physical Characteristics:</b>	
Weight	27.5 kg
Size	0.034 m <sup>3</sup>
Power	33 W

Figure 1.2.2.5-1. SARSAT Concept.

### 1.2.2.6 Data Collection System

The DCS-2 collects global telemetry data using a one-way radio frequency (RF) link 401.65 MHz from data collection platforms in the form of buoys, free-floating balloons, and remote weather stations and processes these inputs for on-board storage and subsequent transmission from the satellite. For free-floating telemetry transmitters, the system determines the location within 5 km to 8 km root mean square (rms) and velocity to an accuracy of 1 meter per second (mps) to 1.6 mps rms. Other characteristics are shown in Table 1.2.2.6-1. Measurements of environmental data are telemetered to the satellite for collection. The DCS-2 supplements the GOES data collection system in collecting both the information from the more-northern and more-southern latitudes and the location data on free-floating transmitters.

<b>Table 1.2.2.6-1. DCS-2 System Characteristics.</b>	
<b>Parameter</b>	<b>Characteristic</b>
Minimum satellite elevation angle from platform	5 degrees
Number of platforms requiring location/velocity measurements visible in a 5 degree -visibility circle	Capacity: 230
Total number of such platforms over the globe	Capacity: 4100
Percentage of platforms with six good Doppler measurements per day	85%
Platform transmission repetition period	Approx. 60 sec
Message length	0.3 to 0.9 sec
Expected location accuracy	5 km to 8 km rms
Expected velocity accuracy	1 to 1.6 mps

For the incoming signals, the DCS-2 measures frequency and relative time. The formatted data are stored in the satellite for transmission to the CDA station. The DCS-2 data are stripped from the GAC data by NOAA/NESDIS and transmitted to the ARGOS center at the Centre National d'Etudes Spatiales (CNES) in Toulouse, France, for processing, distribution to users and storage for archival purposes. Alternatively, there is an operational feature that allows the stored data to be acquired directly by a European ground station.

### 1.2.3 PROPULSION AND REACTION CONTROL SUBSYSTEM

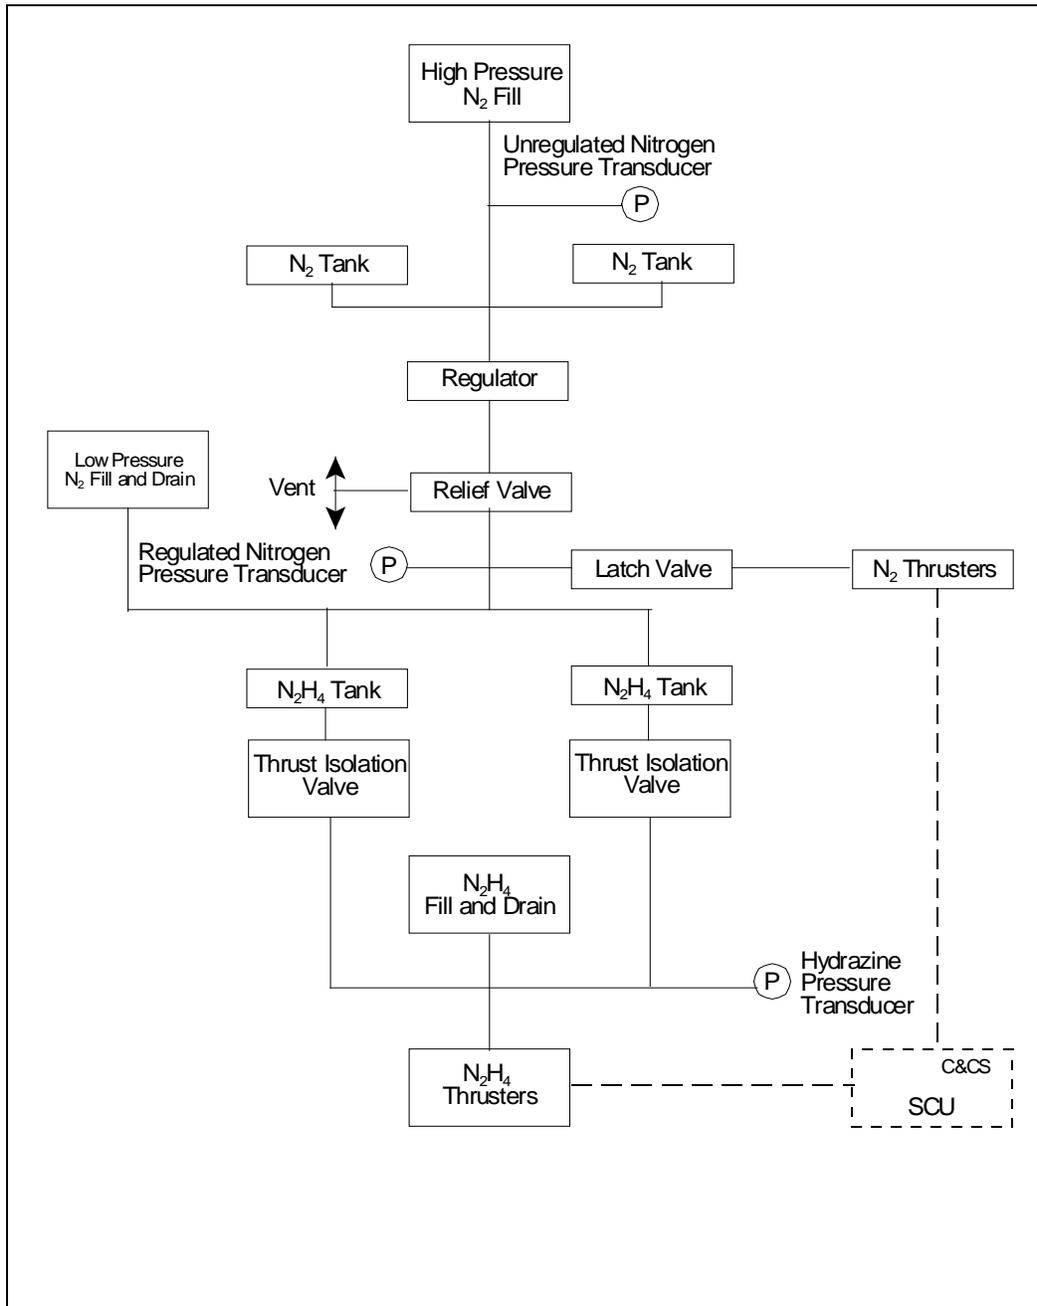

The Propulsion and Reaction Control Subsystem is a hybrid solid/ liquid/cold-gas system consisting of a solid propellant for orbit (apogee) injection and a dual Reaction Control Equipment (RCE) system using both pressure-regulated cold-gas nitrogen thrusters and hydrazine monopropellant thrusters. This subsystem primarily provides separation from the Titan II booster, ascent-phase attitude control (three-axis stabilized) and orbital velocity trim for

the satellite. Figure 1.2.3-1 provides a functional schematic of the RCE.

The hydrazine RCE consists of four thrusters and two spherical storage tanks. The hydrazine thrusters are used for maneuvers requiring large control torques and for all velocity change maneuvers, i.e., spacecraft separation from the booster and orbit circulation trim, as well as pitch and yaw control during the AKM burn. After completion of the orbital velocity trim burn, pyrotechnic valves at the outlet of each hydrazine propellant tank may be fired to isolate the hydrazine thrusters from the propellant tanks and render the system inoperative.

The cold-gas nitrogen RCE consists of eight thrusters and two spherical storage tanks of usable nitrogen. The nitrogen thrusters are used for three-axis control during ascent (except during AKM burn), Earth acquisition after handover and as a backup for momentum unloading in normal orbit mode control. Four of the thrusters provide roll control through Ascent Guidance Software (AGS), and are operated, under software control, in coupled pairs. The remaining four thrusters are operated individually to provide AGS pitch and AGS yaw control.

**Figure 1.2.3-1. RCE Functional Schematic.**

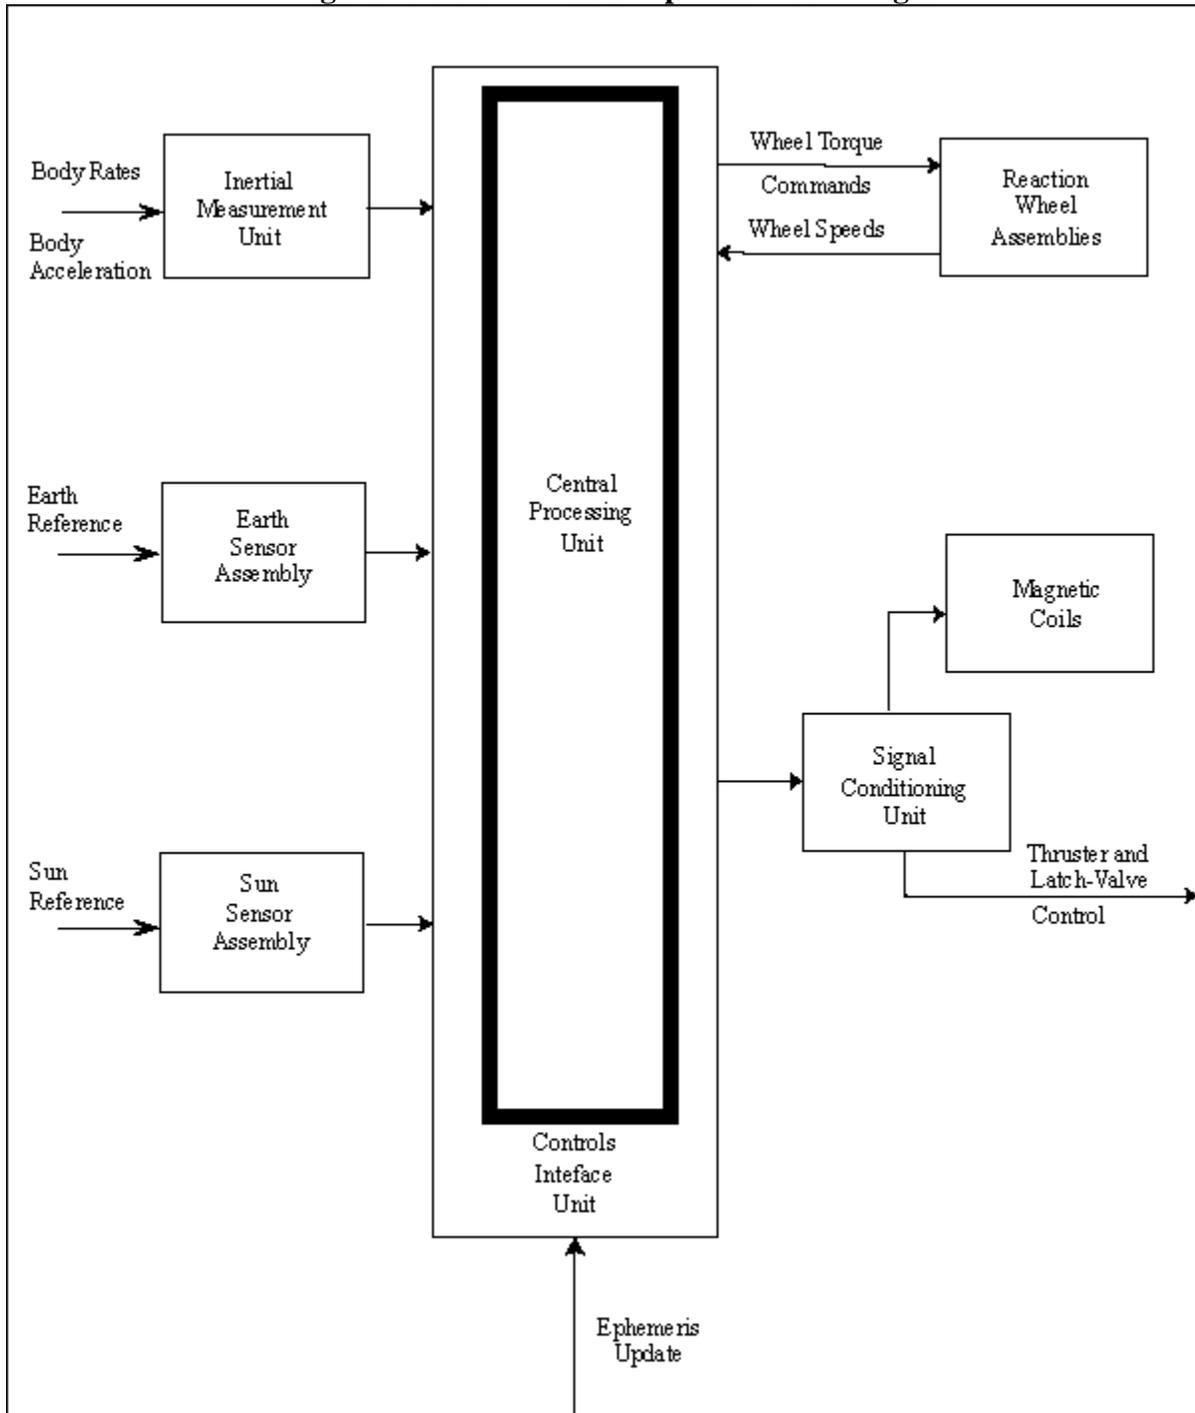

#### 1.2.4 ATTITUDE DETERMINATION AND CONTROL SUBSYSTEM

The Attitude Determination and Control Subsystem (ADACS) provides, in conjunction with the RCS and Command and Control Subsystems (CCS), the functions of the on-orbit attitude control and ascent guidance. It is a zero-momentum system consisting of reaction wheels and Earth,

Sun, and inertial reference sensors. Figure 1.2.4-1 provides a simplified block diagram of the subsystem.

**Figure 1.2.4.1. ADACS Simplified Block Diagram**

In the subsystem's attitude-control mode, the Earth Sensor Assembly (ESA) and the Sun sensor, together with rates derived from the Inertial Measurement Unit (IMU), furnish the primary attitude reference. Control torquing is accomplished by an orthogonal set of Reaction Wheel Assemblies (RWA's) backed up by a fourth skewed reaction wheel. The momentum accumulation in the wheels is unloaded by means of magnetic coils, which, in turn, are backed up by the RCS cold-gas thrusters. The subsystem requires ephemeris data for orbital operation, and this typically can be satisfied with a ground update once per week. In all other respects, the subsystem is autonomous, including the capability for Earth acquisition and reacquisition.

The IMU, which provides yaw, pitch, and roll rate information in orbital mode, is the key component in the ascent guidance phase. The same closed-loop guidance scheme previously used on TIROS-N and ATN missions will be retained. The IMU will furnish a navigation reference from liftoff until orbit insertion and closed-loop guidance for all satellite maneuvers following separation from the launch vehicle.

Satellite attitude-control accuracy in mission orbit is +0.2 degrees with respect to the local geodetic reference frame; knowledge of attitude is obtainable through on-ground processing to an accuracy of  $\pm 0.10$  degrees in all axes. Attitude rates do not exceed 0.035 degrees per sec in pitch and yaw and 0.015 degrees per sec in roll. Attitude determination with a maximum 3-sigma variation better than 0.14 degrees is provided onboard the satellite.

## 1.2.5 MISSION DATA ACQUISITION AND FORMATS

### 1.2.5.1 Environmental Data Formats

No significant changes were proposed in the method of mission data handling and acquisition from that developed for previous satellites in the TIROS-N/ATN series, but a sixth data format was added for AMSU data handling. These six basic data formats are generated onboard the satellite, each associated with one or more of the acquisition modes (stored or real-time, very high frequency (VHF) or S-band transmission). These formats are as follows:

- TIROS Information Processor (TIP) Data

Under routine mission-orbit operations, the TIP output contains low-rate instrument data multiplexed with satellite housekeeping data. It contains all environmental instrument information except that from the AVHRR and the AMSU. It is available in real-time and as stored data.

Low rate instrument data are included every minor frame. Real-time TIP data are normally available through the VHF beacon link. See Section 4 for more information.

For early orbit support and maintenance operations, the TIP has three other operating modes: boost, dwell and satellite computer memory dump.

- High Resolution Picture Transmission (HRPT) Data

HRPT comprises full-resolution data from the AVHRR multiplexed with TIP and AMSU data. HRPT is dedicated to real-time transmissions and is available to local users in split-phase format via either of two S-band communications links with the option of transmission from a third with left circular polarization rather than right circular polarization, which the other two provide. An HRPT major frame comprises three minor frames. One minor frame will contain TIP data, one will contain AMSU data and one will contain backfill data. See Section 4 for more information.

- Local Area Coverage (LAC) Data

The LAC data are essentially the stored version of HRPT, played back at either two or four times the real-time rate, and are made available for centralized processing. They are not intended for local users. LAC data storage is scheduled via the stored command table to provide up to 10 minutes of coverage per tape transport. See Section 4 for more information.

- Global Area Coverage (GAC) Data

GAC data contains TIP, AMSU and reduced resolution AVHRR data. The overall data rate is one-tenth of the LAC data rate, allowing over 100 minutes of data to be stored on one tape transport. Record-to-playback ratio is either 20:1 or 40:1. The GAC stream is for stored data only and is used to develop global data sets for centralized processing and analysis. It is not intended for local users. The reduced resolution of this format allows 100% recovery of the data even under worst-case blind-orbit conditions. See Section 4 for more information.

- Automatic Picture Transmission (APT) Data

APT data are specifically tailored for low-cost VHF local-user ground stations. Again, it is derived from AVHRR video data but at medium resolution. Any two of the five AVHRR channels provided to the MIRP can be selected and processed as "Video A" and "Video B."

One APT line, consisting of one line of Video A and one line of Video B, is output every third AVHRR scan. Ancillary AVHRR data appear at one edge of each line and their 64-second repetition period defines the APT frame length. The resulting line rate is two per second.

APT data are transmitted continuously over a dedicated VHF link as an analog signal consisting of an amplitude-modulated 2400 Hz subcarrier frequency modulating the RF carrier. Table 1.2.5-1 gives the APT line characteristics.

- AMSU Information Processor (AIP) Data

AMSU data is available as part of a low-rate data format. This format contains both standard TIP data and AMSU sensor data. The primary use of this 16 kbps format will be for global recording and playback to CDA stations. It is anticipated that AMSU AIP data will normally be extracted from HRPT, LAC and GAC data. See Section 4 for more information.

<b>Table 1.2.5-1. APT Line Characteristics NOAA KLM Satellites.</b>	
Frequency Band	136 to 139 MHz band
Carrier Frequencies	137.50 to 137.62 MHz
Frequency Stability	±0.002%
Out-of-band Emissions	-60 dB at ± 170 KHz and greater from carrier frequency
Transmitted Bandwidth	-3 dB at ± 25 KHz from carrier frequency
Modulated Rate and Type	±17 KHz FM with a 2.4 KHz subcarrier
EIRP	±33.5 dBm

#### 1.2.6 DATA HANDLING SUBSYSTEM

The functions of the Data Handling Subsystem (DHS) are to collect, format, average, and store baseband data from other satellite subsystems; to output baseband data to other satellite subsystems; and to provide synchronous signals and clocks to other satellite subsystems. Tables 1.2.6-1 and 1.2.6-2 list the subsystem data inputs and data outputs, respectively.

<b>Table 1.2.6-1. NOAA KLM Data Handling Subsystem Data Inputs.</b>			
<b>Name of Data</b>	<b>Source of Data</b>	<b>First Component Receiving the data</b>	<b>Data Characteristics</b>
Analog Telemetry	All active electronic components on the satellite - 512 separate channels	TIP	Analog health-monitor voltage on a dedicated wire per quantity.
Digital-B Telemetry	Same as above, but 352 separate channels.	TIP	Bi-level status voltage on a dedicated wire per quantity.

Central Processing Unit (CPU) Telemetry-Boost Mode	Same as above, but 352 separate channels.	TIP	NRZ-L data per a specified hand-shake. 8000 bps.
CPU Telemetry - Orbit Mode	CIU	TIP	Same as above, but at 960 bps.
Command Verification Data	CIU	TIP	NRZ-L data per a specified hand-shake. One 16-word per 0.05 second (Boost Mode) or 0.1 second (Orbit Mode).
Digital-A Data	All Government-furnished instruments except AVHRR, SARR, SARP and AMSU. (16 channels, 4 used).	TIP	NRZ-L data per a specified hand-shake. In multiples of 8 bits per 0.1 second: not accepted in TIP Boost or Dwell Modes.
AVHRR Data	AVHRR	MIRP	NRZ-L data per a specified hand-shake. In bursts at 1.9968 Mbps, averaging to 0.6213 Mbps.
AMSU Data	AMSU-A1, A2, B and MHS	AIP	NRZ-L data per a specified hand-shake. 25 8-bit words from AMSU-A1, 13 8-bit words from AMSU-A2, and 50 8-bit words from AMSU-B per 0.1 second. Not intended for TIP Boost or Dwell Modes.

**Table 1.2.6-2. NOAA KLM Data Handling Subsystem Data Outputs**

<b>Name of Data</b>	<b>Real-Time or Playback</b>	<b>Destination</b>	<b>Conditions</b>	<b>Data Characteristics</b>
TIP Orbit	Real-Time	Both Beacon Transmitters (BTX's)	TIP in Orbit Mode	8320 bps split phase

TIP Orbit	Real-Time	STX-2 STX-4	TIP in Orbit Mode Command to XSU Command to AIP	8320 bps split phase
TIP Boost	Real-Time	STX-2 STX-4 (PRIMARY)	TIP in Boost Mode Command to XSU Command to AIP	16640 bps split phase
HRPT	Real-Time	STX-1, -2, or -3	MIRP On Command to XSU	665.4 kbps split phase
APT	Real-Time	Both VHF Real- time Transmitters (VTX's)	MIRP On	Amplitude- modulated 2400- Hz subcarrier
TIP Orbit	Playback	STX-1, -2, or -3	Command to XSU	332.7 kbps split phase
TIP Boost	Playback	STX-1, -2, or -3	Command to XSU	332.7 kbps split phase
GAC	Playback	STX-1, -2, or -3 and STX-4	MIRP on Command to XSU	2.6616 Mbps NRZ or 1.3308 Mbps split phase
LAC	Playback	STX-1, -2, or -3 and STX-4	MIRP on Command to XSU	2.6616 Mbps NRZ or 1.3308 Mbps split phase
TIP Subcom Data	Real-Time	CIU	CIU responds to handshake	64 bits per TIP minor frame-in bursts
AIP	Playback	STX-1, -2, or -3 and STX-4	AIP in Data Mode TIP in Orbit Mode Command to XSU	332.7 kbps split phase

AIP	Real-Time	STX-1, -2 or -3	AIP in Data Mode TIP in Orbit Mode Command to XSU	16640 bps split phase
		STX-4	Command to AIP	

The MIRP generates the four formats (GAC, LAC, HRPT and APT) described earlier. It incorporates algorithms for data processing and data compression and contains large multi-access buffer stores, which time-average the intermittent AVHRR Earth-scan input (thereby achieving a bandwidth reduction) and manipulates the AVHRR signals together with TIP and AIP data into the desired digital formats.

Data storage is provided by five identical DTRs. Each DTR consists of one Electronic Unit (EU) and two tape Transport Units (TU's) with the EU switchable to either of the TU's. Each TU has a record capacity of 225 min of TIP data, 113 min of GAC data or 11.3 min of LAC data. Normal operational playback time for GAC or LAC data is 3 min, but a one-half speed (6 min) GAC or LAC playback can also be commanded. The DTRs are identical to provide flexibility and redundancy at a minimum cost. The spacecraft XSU during record provides the selected record mode command (TIP, GAC, or LAC) clock, and record input data to any of the five DTRs. During playback, the XSU provides the selected playback mode command (TIP, GAC, or LAC) and clock to any of the five DTRs, as well as playback output data from any of the five DTRs to any of four S-band transmitters.

### 1.2.7 COMMUNICATIONS SUBSYSTEMS

The functional requirements of the Communications subsystem are separated into three distinct phases: prelaunch, liftoff to handover and the mission phase where the solar array and all antennas are deployed. During the mission phase, the subsystem provides the following function:

- Mission Phase

- Reception and demodulation of S-band commands.
- Continuous transmission of TIP data via the VHF Beacon.
- Continuous transmission of APT data at VHF.
- Continuous transmission of HRPT data at S-band.
- Transmission of stored LAC, GAC, TIP, and AIP data upon command at S-band.
- Reception and filtering of DCS signals.
- Reception, processing and retransmission of SAR signals.

The subsystem comprises 14 antennas, 9 transmitters, and redundant receivers, together with associated filters and other RF feed components. Three 7-watt STX's (STX-1, -2, and -3) and three directional S-band antennas (SBA's) (SBA-1, -2, and -3) mounted on the satellite Earth-facing (+X) surface provide the three principal S-band data links. VHF Omni coverage for real-time TIP telemetry is provided by two 1-watt beacon transmitters (BTX-1 and -2) operating through an omni antenna also mounted on the +X side of the spacecraft. Launch and emergency coverage is provided by a fourth 7-watt (STX-4) and a set of omni antennas mounted on the +X and -X sides of the spacecraft. The two APT 5-watt VTX's (VTX-1 and -2) use a separate dedicated helical antenna; this, like the instrument dedicated antennas, is also directional, Earth-face mounted, and used only in mission mode. The SAR Receiver Antenna (SRA) developed on the ATN program is a unique design incorporating two nested helices: the outer element serving the 121.5 MHz and 243 MHz link, the inner one the 406.05 MHz link.

The fourth SAR uplink (406.025 MHz) is combined with the DCS uplink and is received via the UDA.

The subsystem has two sets of communications links (ascent and operational), which are summarized in Tables 1.2.7-1 and 1.2.7-2. The following summary describes the relationship of subsystem equipment to the communications links:

- S-Band Transmitting Equipment - Three directional SBA's (SBA-1, -2, and -3), and three STX's (STX-1, -2, and -3) provide the routine S-Band downlink services in operational orbit. These downlink services consist of HRPT, GAC playback, TIP playback and LAC playback data. SBA-1 and STX-1 transmit the lowest of the three frequencies, while SBA-3 and STX-3 transmit the highest.

The S-Band omni antennas (SOA's) (SOA-3, -4) and STX-4 provide launch real-time telemetry to the NASA tracking station at VAFB/WR and to the Advanced Range Instrumented Aircraft (ARIA) aircraft.

- Command Receiving Equipment - The command signal is Phase Modulated (PM) on a carrier at 2026.0 MHz. The modulating signal is a 16 kHz subcarrier modulated by 2 kbps split-phase-level data.

The Command Antennas, RF Filters, and Dual Command Receiver recover the signal. Both command receivers operate simultaneously and continuously. The outputs of both receivers are cross-strapped externally to the two Command Demodulators. The Command Receiver-Demodulator provides two isolated sets of outputs. Each set of separate output lines are provided to the Control Interface Unit (CIU) and Decryption/Authentication Unit (DAU) for uplink processing.

The receivers are permanently connected to a set of S-band omni-directional antennas via a hybrid network.

- VHF Telemetry Equipment - The beacon antenna, RF filter, RF switch and BTX (BTX-1 or BTX-2) provide the TIP real-time data listed in Tables 1.2.7-1

and 1.2.7-2.

The directional VHF real-time antenna (VRA), RF filter, and VHF real-time transmitter (VTX-1 or -2) provide the APT data in Table 1.2.7-1.

- Antennas and RF Filters for Payload Instruments - The directional UDA, Data Collection System/Search and Rescue Processor Diplexer (DPD), and RF filter provide the antenna and electromagnetic interference isolation for the DCS listed in Table 1.2.7-1.

The UDA, DPD and RF filter provide the corresponding service for the SARP.

The directional SRA, the directional Search and Rescue L-Band Antenna (SLA) and RF filters provide the corresponding services for the SARR.

<b>Table 1.2.7-1. Ascent, Early-Orbit and Contingency RF Communications Link Characteristics Summary.</b>				
<b>Link</b>	<b>Ground Facility</b>	<b>Frequency</b>	<b>Modulation</b>	<b>Bit Rate</b>
S-Band Command	NAGE (pre-launch), CDA, GN	2026 MHz	BPSK/NRZ-M	2 kbps
S-Band TIP Real-Time	WSMC, ARIA Aircraft, AFSCN, DSN, CDA	2247.5 MHz and 1702.5 MHz	Split-Phase Level Data	8,320 bps or 16,640 bps
S-Band TIP Playback	WTR, CDA, Lannion	1702.5 MHz 1707.0 MHz	Same as above	332.7 kbps
VHF TIP Real-Time	CDA, Lannion	137.35 or 137.77 MHz	Same as above	8,320 bps

**Table 1.2.7-2. NOAA KLM Operational Link Summary**

<b>Link</b>	<b>Data Contents</b>	<b>Ground Facility</b>	<b>Frequency</b>
S-Band Command	Satellite commands (clear mode or encrypted)	CDA	2026 MHz
VHF TIP Real-Time	Housekeeping telemetry and payload data from all meteorological instruments except AVHRR and AMSU	CDA, TIP Stations	137.35 or 137.77 MHz
HRPT	Full-resolution AVHRR data plus concurrent TIP AMSU and TIP data	CDA, HRPT Stations	1698 or 1707 MHz
GAC Playback	Global reduced-resolution AVHRR data plus TIP data stored on satellite tape recorders	CDA	1702.5 MHz and either 1698 or 1707 MHz
LAC Playback	Tape-recorded-replica of HRPT data		Same as above.
TIP/AIP Playback	Tape-recorded-replica of TIP/AIP real-time data	Lannion TIP Playback Station	1698 or 1702.5 or 1707 MHz
APT	Reduced resolution, geometrically-corrected analog video from two of the five AVHRR channels, selected by command	CDA, APT Stations	137.50 or 137.62 MHz
DCS Uplink Messages	Environmental measurements, identification, and a frequency reference for Doppler navigation; from unattended platforms	DCS Platforms	401.65 MHz
SAR 121.5 MHz Uplink Signals, 243 MHz Uplink Signals	Emergency transmissions from downed aircraft and ships. Aircraft transmitters are ELT's; ship transmitters are EPIRB's	121.5/243-MHz ELT's EPIRB's	121.5 MHz 243 MHz

SAR 406 MHz Uplink Messages Received Separately by SARR 406 MHz Channel and by SARP	Same as above, but with improved frequency stability and modulation containing identification of the aircraft or ship	406-MHz ELT's and EPIRB's	406.05 MHz
SARR Downlink	Transponder frequency-multiplexed SAR uplink signals and messages from all three uplink frequencies, preserving uplink phase for Doppler tracking by ground stations; also 406-MHz messages reformatted and tagged with time and Doppler measurements by the SARP; the SARP data transmitted in near-real-time and also cyclically from SARM.	SAR LUT's	1544.5 MHz

### 1.2.8 THERMAL CONTROL SYSTEMS (TCS)

The TCS consist of active and passive thermal control equipment. The TCS maintains unit temperatures within the specified operating range, generally within limits of 0 to 35 degrees Centigrade (C). A combination of onboard and nonflight thermal control is required during test or prelaunch phase.

Passive thermal control is affected by the appropriate use of multilayer insulation blankets, aluminized Teflon thermal shielding, special finishes, and thermal-conduction-control materials. The major active elements of the TCS are heaters and louver-controlled cooling radiators. There are two types of louvers: vane louvers and pinwheel louvers, both controlled by Thermal Control Electronics (TCE) units. The satellite incorporates a safe-state mode of operation where, in the event of a major anomaly such as loss of proper attitude, a powered-down state is automatically entered. Under this condition, TCS heaters maintain critical equipment, including instruments, at a safe temperature until mission operations can be re-established.

The thermal control system is designed to achieve satellite thermal control for all Sun angles between 0 degrees to 80 degrees. The TCS functions include the following:

- Maintain spacecraft subsystem and instrument temperatures within spacecraft allowable limits;
- Minimize temperature excursions within the specified limits (T<5 degrees C/hour);

- Minimize thermal impact of AKM burn during mission ascent phase;
- Prevent on-orbit low temperatures within the RCE hydrazine system;
- Maintain instrument interface temperatures, operational mode only, between 0 and 30 degrees C and internal satellite/equipment between 5 and 35 degrees C;
- Prelaunch thermal conditioning of equipment before and during mission ascent phase.

### 1.2.9 POWER SYSTEM

Electrical power is provided by a direct energy transfer regulated bus power system. The primary energy converter is a single-axis-sun tracking solar array, and the energy storage system consists of a set of three nickel-cadmium batteries. The major components are the Solar Array (SA), batteries, Power Supply Electronics (PSE), Battery Charge Assembly (BCA), Solar Array Drive (SAD), Array Drive Electronics (ADE), Battery Reconditioning Unit (BRU) and the Controls Power Converter (CPC).

In the mission mode, the SAD rotates the SA once per orbit so that it continually faces the Sun. The SA is canted to either 22 or 36 degrees to the orbit normal, depending on whether the spacecraft is in a morning or afternoon orbit. The three batteries supply power through the boost regulator during the dark portions of each orbit and augment the solar array for peak-load conditions during orbital daylight.

## **2.0 NOAA POLAR SATELLITE NAVIGATION AND EARTH LOCATION**

In this document, when reference is made to satellite navigation, the emphasis is on information representing the satellite orbital position, velocity and orientation. Our goal is to present information that will enhance the user's ability to receive and process polar instrument data.

### **2.1 NAVIGATING THE POLAR SATELLITE**

Any object in orbit about a more massive body will follow Kepler's three laws of motion:

1. The path of the object will be an ellipse, with the massive body at one focus.
2. A straight line joining the central body and the orbiting body will sweep out equal areas in equal times.
3. The square of the sidereal (relative to the stars) period of the orbiting body is directly proportional to the cube of the semi-major axis of the orbit.

These relations are true for any orbit; a planet orbiting a star, a moon orbiting a planet, or an artificial satellite orbiting the Earth. Discussion here will be confined to the last case.

If the Earth was a perfect sphere and there were no nearby bodies, the orbit into which the satellite was placed initially would remain unchanged. However, the presence of the Sun and Moon will cause the orbit to vary. Since the orbits which are being considered here are close to the Earth, the most important cause of variation in the orbit is the non-sphericity of the Earth; the flattening of the poles and the bulging of the equator resulting from the adjustment of the Earth to its rotation. The equatorial bulge is small, the equatorial radius exceeding the polar radius by only about a third of a percent. Nevertheless, this is sufficient to have a major effect on the behavior of a satellite orbit.

Since a satellite is a rotating body, a torque applied perpendicular to the axis of rotation will result in a precession of the rotation axis. Such a torque is supplied by the attraction of the equatorial bulges. The amount of torque, and hence the amount of precession, is governed by two quantities: the mean distance of the satellite from the Earth center, ( $a$  - the semi-major axis of the orbit ellipse), and the inclination of the orbital plane to the Earth's equatorial plane,  $I$ , measured through 180 degrees from the east direction (the direction of the Earth's rotation).

This situation permits certain characteristics of the orbit to be controlled. The satellite height is usually specified initially in order to achieve the desired Earth coverage with particular instruments. For NOAA satellites, the inclination is then chosen such that the orbit will precess in the same direction and at the same rate as the Earth revolves about the Sun. This situation is termed Sun synchronous, and means that the satellite will preserve its angular relationship with the Sun over time. This causes the satellite to view each latitude at the same Local Solar Time (LST) on each orbit.

The NOAA series of satellites have been placed in orbits with a mean height of about 850 kilometers (semi-major axis about 7228 kilometers). In order to be Sun synchronous, the inclination must then be about 99 degrees. This means that the satellite moves in a westward direction, termed a retrograde orbit, since the satellite motion is opposite to the Earth rotation direction. Since, by Kepler's third law, the period is related to the semi-major axis, the period must be about 102 minutes. The period usually specified for NOAA series satellites is the *nodal* period - the time from one ascending node to the next. Since the orbit is precessing, this will be slightly different from the sidereal period - relative to a fixed point on the celestial sphere. A third period which is often given is the anomalistic period - the time from perigee to perigee. Perigee is the point in the orbit which is closest to the Earth center; this also changes with time.

The LST of the ascending node is not constrained by any of these considerations, and is chosen for other reasons, mainly coverage. Power and thermal constraints preclude normal operation within two hours of noon LST. The times usually chosen are either an ascending (northbound) node around 1430 LST or a descending (southbound) node around 0730 LST.

Thus far only the characteristics of the orbit in space have been considered, with no reference to the physical Earth around which the satellite travels (except for the effects of the equatorial bulges). Although the orbital plane is precessing with a period of one year, the Earth is rotating beneath it once per day, causing the satellite to pass over different geographical areas on each pass. The movement is just the amount that the Earth has rotated in one orbital period, and is 25.5 degrees of longitude (in 102 minutes). Since the Earth rotates from west to east, this displacement is westward.

## **2.2 EARTH LOCATING THE POLAR SATELLITE DATA**

The Earth viewing instruments on the NOAA satellites (with one exception) are cross-track scanners; i.e., they scan perpendicular to the direction of movement of the satellite. For each instrument several quantities are important for Earth viewing:

1. The angular field of view for a single observation - instantaneous field of view (IFOV) - not needed to compute Earth locations.
2. The step angle between consecutive observations.
3. The step time.
4. The number of steps.

These values are all measured at the satellite position. A scan angle of zero corresponds to the midpoint of the scan. It may not correspond to an actual IFOV. Values for the scan data for each instrument can be found in Appendix J.

The actual area on the Earth observed in an IFOV or encompassed within the width of a scan swath depends on the height of the satellite above the Earth surface. This height is not constant for two reasons. Even if the satellite were in a perfectly circular orbit, the Earth is approximately an ellipsoid, the radius of which varies by 21.4 kilometers from equator to pole. Additionally, the satellite orbit, while very close to circular, is not exactly so. Since the Earth center is at one

focus of the elliptic orbit, it is displaced to one side of the ellipse. While the combined effects of these two factors must be considered for correct Earth location, for generalized approximations they may be neglected, and the orbit considered to be perfectly circular about a spherical Earth.

Within a single scan, the area on the Earth within an IFOV will increase with the angle from nadir, due to the combined effects of an oblique viewing angle and the curvature of the Earth. The nadir direction is defined by a line through the satellite which is perpendicular to the surface of the Earth ellipsoid. This point of intersection of this line with the ellipsoid is defined as the sub-satellite point (SSP).

Using the satellite position, the scan angle, and any pertinent attitude angles (in Section 2.3), the direction in inertial space in which a given instrument is looking - the Line of Sight (LOS) - is found. The intersection of the LOS with the ellipsoid may then be found. In order to determine the longitude of the intersection, the Greenwich Hour Angle (GHA) must be found for the time of the observation. This is the longitude difference between the Greenwich meridian and the zero longitude of the inertial coordinate system - the Vernal Equinox. Once this is done the exact Earth location which the instrument is viewing (geodetic latitude and longitude) may be found. See Appendix I for the Earth location algorithm.

### **2.3 NAVIGATION AND EARTH LOCATION PROCESSING WITHIN NOAA**

To provide accurate satellite navigation data, the Engineering Branch of the Mission Operations Division (MOD), which is part of the Office of Satellite and Product Operations (OSPO), receives a daily set of Inertial Osculating Cartesian orbit parameters for each polar satellite from the Air Force or Navy. This orbit vector is used to generate a predicted User Ephemeris File (UEF) of orbit vectors spaced one minute apart that cover a 10 day time span. This file is created using a COWELL numerical integrator (using Störmer-Cowell formulas) which maintains the one kilometer accuracy of the initial orbit vector (Maury and Brodsky, 1969 and Moore and Beandet, 1973). The UEF is the foundation for all the navigation data produced in MOD. It is utilized to create the TBUS bulletins, the equator crossing information files, the Search and Rescue (SAR) orbit ephemeris files and Level 1b instrument data files. The SAR ephemeris data is provided for use by the U.S. Mission Control Center for Search and Rescue. The level 1B process uses the orbital information in the UEF files to provide Earth located data for the NOAA polar satellite instruments.

The Earth location data provided in the Level 1b process is produced by the Advanced Earth Location Data System (AELDS). This system was initially implemented on September 8, 1992 in the AVHRR Level 1b process and on September 7, 1994 in the TOVS Level 1b process. It is an on-line Earth location process utilizing the scan line time codes to produce Earth location. With the introduction of AELDS the accuracy of the Earth location data in the Level 1b file was improved by 50%.

The Earth location algorithm used to produce the latitude and longitude parameters within the AELDS process are available in Appendix I. The AELDS process provides more than just latitude and longitude information. Given the satellite position and velocity vector and the Greenwich Hour Angle (GHA), AELDS will provide the satellite height and

northbound/southbound flags. Also, given the scan time, stepping time, stepping angle, and number of positions desired; AELDS can also provide the following for each scan point of a specific instrument:

- Solar zenith angle
- Satellite zenith angle
- Solar azimuth angle
- Satellite azimuth angle
- Relative azimuth angle

In order to insure that the Earth location and navigation information provided by MOD lies within acceptable accuracy limits, quality control (QC) operations are performed during and after generation of the data. At present, three types of checks are used:

- 1) Navigation: When the UEF containing predicted satellite position and velocity data is generated; the radius vector is compared to that generated using the elements for the previous seven days of data (delta-R). Generally, these differences remain less than one kilometer for at least 7 to 10 days.
- 2) On-line Earth location: An Earth location tolerance check of the satellite subpoint (nadir) location has been integrated into the AELDS process. The subpoint position is calculated by an independent method and compared with the position generated by AELDS. The acceptable value of the difference can be reset and the actual option can be turned on or off. This tolerance check gives the reassurance that the Earth location algorithm is behaving correctly.
- 3) Post processing Earth location: An image QC system is used to verify the accuracy of the Earth location data generated using the UEF and appended to the AVHRR instrument raw data in the level 1B files.

Utilization of the above image QC techniques has provided greater insight into the magnitude of Earth location errors as well as the source of some of the errors. To increase the data accuracy, MOD has enhanced the on-line Earth location process (AELDS) to include fixed attitude corrections and TIP clock corrections.

Fixed attitude corrections include corrections for errors such as instrument mounting errors and constant observed errors. An algorithm has been integrated into the Earth location process that accounts for these errors.

The Satellite Operations Control Center (SOCC) maintains the on-board clocks for the NOAA POES satellites. They monitor the accuracy of the clocks and make adjustments whenever needed. The SOCC clock adjustments are made for two reasons:

- 1) The clock has drifted outside the tolerance level and is reset or corrected to over compensate for the error. The clock error is then allowed to drift back through zero until it again exceeds the tolerance.

- 2) When a leap second is needed at the end of December or June, the TIP clock is adjusted depending on the resultant error when combined with the existing clock error.

MOD maintains clock drift files containing all SOCC corrections. These files are utilized to correct the Earth location data using the instrument scan times and are available to the user community in the following URL: <http://www.ospo.noaa.gov/Products/ppp/navpage.html>.

Generally, after the fixed attitude corrections and TIP clock corrections, the Earth location error seen in the image data around the satellite subpoint remains within 1 kilometer (specifications for AVHRR are 4-5 kilometers). The error near the limb is expected to be larger, and is often less than 3 kilometers. At any time during the process, these attitude corrections may be turned on or off.

### 2.3.1 UPDATES TO THE TBUS BULLETIN

The TBUS bulletin is a major source of orbital data for direct readout users. Although, the UEF is used in creating all four parts of the TBUS bulletin, MOD's focus is on Part IV of the bulletin. More information on the TBUS bulletin can be obtained from section 5.1 and Appendix A. MOD, in conjunction with SOCC, has outlined steps to make Part IV more user-friendly and to increase the accuracy of the data (the Brouwer Mean elements). Action has been taken in the following areas:

- The clock correction information found in the comments section of the TBUS bulletin, was provided in a format similar to that in Part IV. The objective is to maintain consistency in the location of the clock correction information so that users can automate their process.
- The equator crossing longitude was added in the spare fields at the end of Part IV.
- Methods for improving the accuracy of the Brouwer Mean elements are under investigation.
- The BROLYD orbit prediction software package currently available to the user community will be implemented on a personal computer. Test runs of the software will be analyzed to determine modifications to the procedure, software, or algorithm that will improve the performance or accuracy. Other propagation packages that could be made available to the users will be examined to determine their usefulness.

### 2.3.2 NAVIGATION DATA ON THE INTERNET

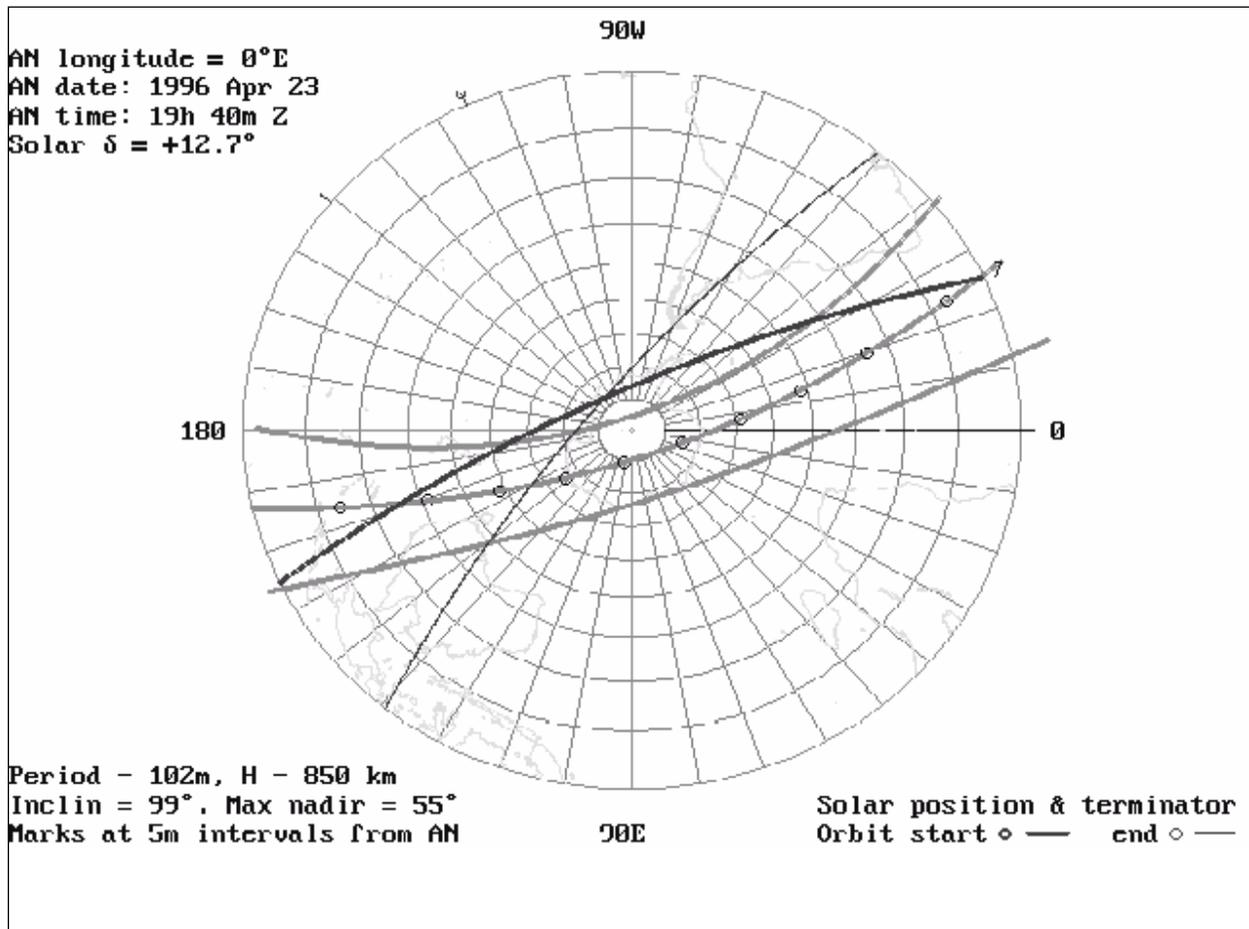

The MOD Polar Navigation information can be obtained from <http://www.ospo.noaa.gov/Products/ppp/navpage.html>

- TBUS messages - Both current and limited historical TBUS bulletins are available for each of the operational NOAA polar satellites.

- Brouwer/Lyddane Software Package - This package exists on the network as part of the NOAA Polar Orbiter Data Users Guide and also as Appendix B in this document.

The following entries are a part of the navigation page:

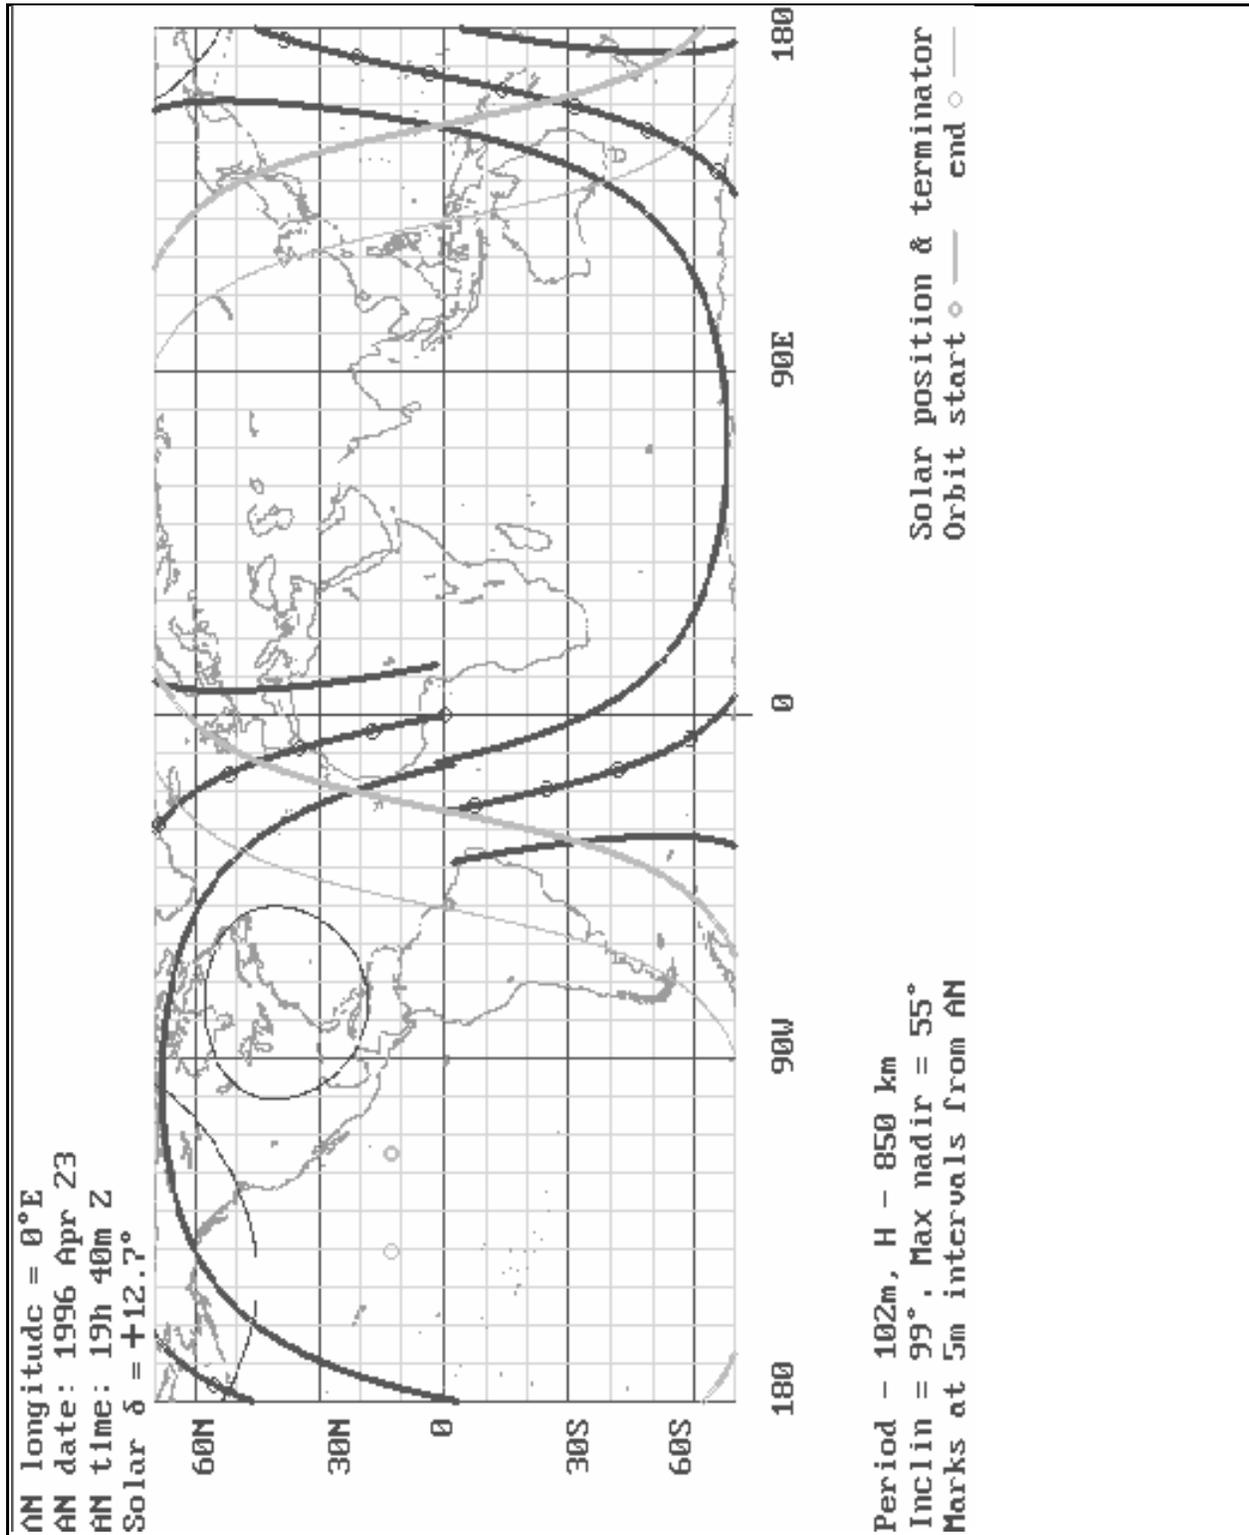

- Graphical orbit locator - This locator can be used to plot the orbit subtrack for NOAA polar orbiters either on a map of the Northern Hemisphere, Southern Hemisphere, or Equatorial Equal Spaced projection. Directions for the use of the locator are included in the page. An example of the plots available through this software are shown in Figures 2.3.2-1 and 2.3.2-2.
- Equator crossing data - Files for each of the operational polar satellites are presented on this page. Current data and limited historical data are available. Each file contains entries for one hundred orbits showing the equator crossing time in the form of a modified Julian day number (Julian day minus 2400000.5) and Gregorian calendar date with time in hours/minutes/seconds. The equator crossing longitude (East) and orbit number are also provided for each entry. An example of the equator crossing data for NOAA-14 is shown in Figure 2.3.2-3 (note that the column and row separators in this figure do not appear in the data itself).
- Earth location algorithm - The Earth location algorithm used in the AELDS software is provided in Appendix I and as a link in the overview from the navigation page.
- TIP Clock Error Database - The file used by the AELDS process to correct Level 1b data for TIP clock errors is available on the navigation page. There are files for each of the operational polar satellites. The files contain entries in chronologically ascending order (newest update first). An example of the contents of the file is given in Figure 2.3.2-4.

**Figure 2.3.2-1. Sample plot available from Graphical orbit locator.**

The MOD updates or enhancements to the navigation and Earth location process are on going. For example, an Earth location error database is planned for Level 1b data users. This database will contain Earth location error information based on actual error measurements taken from AVHRR imagery. Every attempt was made to keep the current systems compatible with the prior satellite series.

Figure 2.3.2-2. Sample plot available from Graphical Orbit Locator.

**Table 2.3.2-1. Sample NOAA-14 Equator Crossing Data.**

N	REV NUM	EQ.XING.TIME (MJD)	Year	Month	Day	Hour	Min	Second	EQ.XING LONGITUDE

**2.4 INTERPOLATING THE LEVEL 1b EARTH LOCATION DATA**

The geographic location of AVHRR LAC/HRPT viewed areas presents a problem, since one scan line contains 2048 viewed spots, but only 51 of these are located in the Level 1b data; point 25 being the first located point, and then every fortieth point. The scan is from right to left, when facing in the direction of satellite motion. GAC data are less of a problem, since every eighth

point is located. **It should be noted, however, that the Earth locations given for GAC areas are not in the center of the area;** see Section 2.4.4. All other instruments currently on NOAA satellites have all observed areas located. Since investigators often require the location of all observed points, the locations for points intermediate between those given in the Level 1b data must be obtained by interpolation. The common method is to interpolate linearly separately in latitude and longitude between given points. This study was undertaken to determine the accuracy of such linear interpolation, and if this method should prove insufficiently accurate, to determine an interpolation method which would yield acceptable accuracy.

#### 2.4.1 METHOD

In order to ascertain the accuracy of an interpolation method, it is necessary to know the true location of every point. In order to simplify the computations, a spherical earth was assumed, permitting the use of spherical trigonometry. The radius was taken to be 6371 km, the approximate mean radius of the actual Earth.

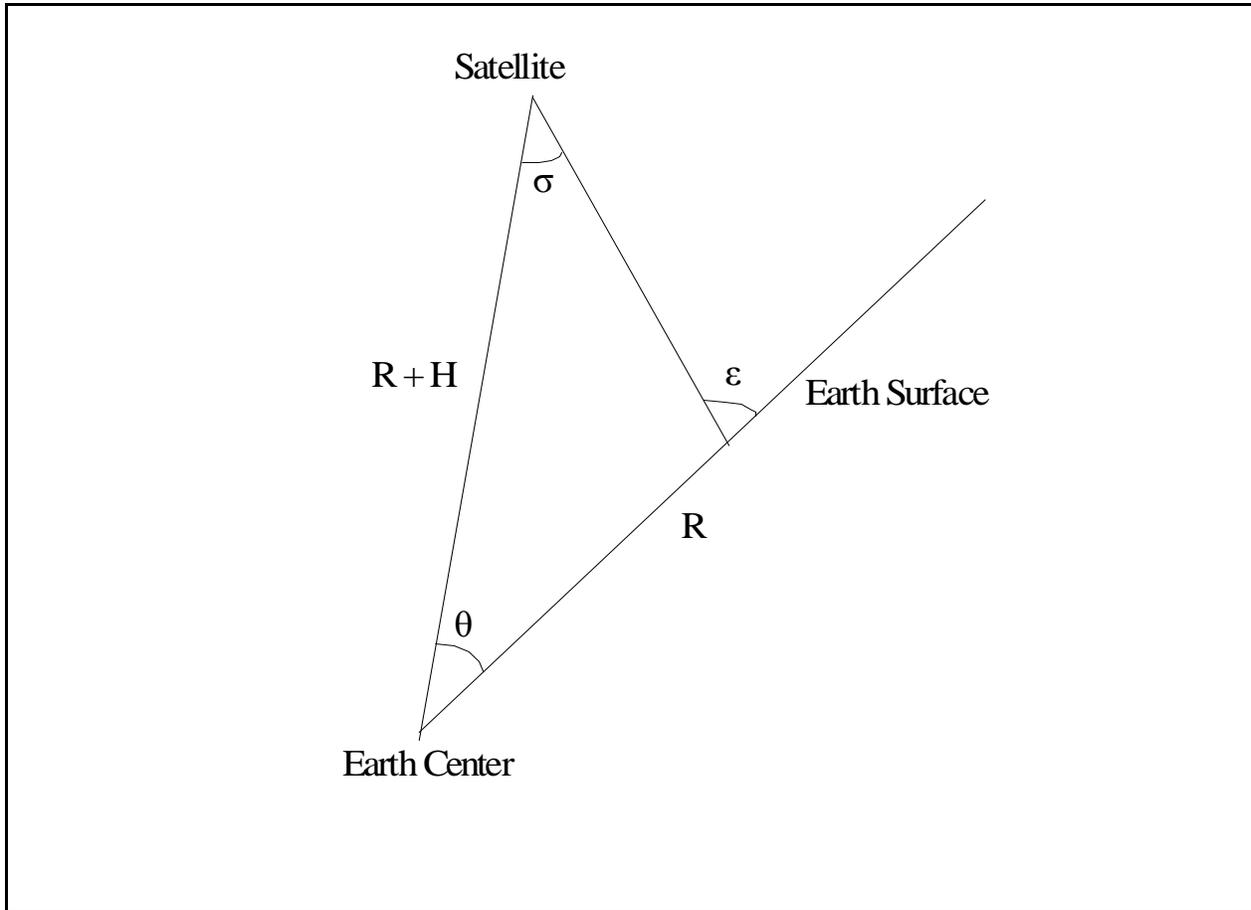

The satellite altitude was assumed to be 850 km with an inclination,  $\beta$ , of 99 degrees, and assumed to be in the first quarter orbit (northbound, in the Northern Hemisphere), and only the right (first) half of the scan was considered. These assumptions will have no effect on the results, since the configuration is completely symmetrical. The trace of the scan line on the earth may be assumed to be a great circle, especially since only the portion of a scan which includes at most five Level 1b located points will be examined at one time. The time for this to occur is about 5 milliseconds, during which the sub-satellite point will have moved about 35 meters. The satellite position was therefore taken as fixed, and the 1024 true scan locations calculated, using a scan step of 0.0541 degrees. It should be noted that this scan step, combined with the field of view of the sensor, results in an over sampling of 1.362 samples per field of view; in other words, the LAC data overlap (see Figures 2.4.4-1 and 2.4.4-2). No attempt was made to do any calculations which involved using points on both sides of the nadir point. This is of little consequence, since interpolated positions are most accurate near nadir.

and the longitude relative to the sub point by:

$$\cos \Delta\lambda = \frac{\cos \phi_0 \cos \theta - \sin \phi_0 \sin \theta \cos \alpha_L}{\cos \phi}$$

Performing these computations for each scan step, starting at an angle from nadir of half a scan step, defines the true Earth locations to which the interpolated locations will be compared.

**Figure 2.4.1-2. Angular relationship between satellite, surface and Earth Center**

## 2.4.2 RESULTS

The results for linear interpolation are shown in Table 2.4.2-1. The point numbers are those of located points, and the range of scan angles are shown for each group. In each group of 39 interpolated points, the mean error and the maximum error are shown, converted to linear distance in kilometers on the surface of the Earth. For all interpolation methods, the variation with sub-point latitude is small, as would be expected as a result of the spherical assumption. For an ellipsoidal Earth, the variation may be somewhat larger. Near nadir the errors are small, but become completely unacceptable by the time the most limbward pair of points are reached.

24 - 25	-4.301	-2.137	0.0193	0.0297

The accuracy is improved by a three point interpolation in latitude and in longitude, using the Lagrangian interpolation algorithm (see Section 2.4.3 for a discussion of this algorithm). The use of the Lagrangian method does not seem to be critical, and any three point interpolation seems to be equally good. As shown in Table 2.4.2-2, the accuracy near nadir becomes even better, while the limbward interval improves markedly, the maximum error being only 2/3 km.

Point Number	Scan Angle Range (degrees)		Mean Distance (km)	Maximum Distance (km)

There remain the 24 scan points before the first located point (23 points after the last located point) the locations of which cannot be interpolated, but must be extrapolated. Table 2.4.2-3 presents the values extrapolated from the first three located points. Since the errors change rapidly, values are given for each point. In addition to the total error in kilometers, the individual errors in latitude and longitude are also presented. The error for point 25 is exactly zero, since this is a located point. The location errors grow rapidly, being over 5 km for the limbward point

<b>Table 2.4.2-3. Errors for Lagrangian Interpolation From Three Limbward Located AVHRR Points at Latitude = 40°.</b>

25	54.127	0.0000	0.0000	0.0000

Table 2.4.2-4 shows the same information except with the extrapolation done with a five point Lagrangian algorithm. This shows a marked improvement, with the maximum error being only slightly greater than 1 km. This would probably be sufficiently accurate for almost all purposes. It should be noted that while the nominal Earth field of view of AVHRR is 1.1 km, this is true only at nadir. The limbwardmost coverage is 6.5 x 2.3 km. A 1 km location error is thus much less than the size of a field of view.

### 2.4.3 LAGRANGIAN INTERPOLATION

Given a set of n coordinates,  $x_i, y_i$ , where  $i = 1$  to  $n$ , a general value of  $y$  is given by

$$y = \sum_{i=1}^n y_i L_i$$

Where

$$L_i = \prod_{j=1, j \neq i}^n \frac{(x - x_j)}{(x_i - x_j)}$$

x being the value corresponding to the y which is being sought (the symbol  $\mathcal{Q}$  indicates a product). It should be noted that the given x points must all be different. However, the points need not be equally spaced, and it is not necessary that they be in order (Meeus, 1991).

A schematic computer program for performing Lagrangian interpolation follows:

n	Number of input points
x(1),y(1) x(2),y(2), ... x(n),y(n)	Input points
x0	X for which Y is to be interpolated
y0=0	Interpolated value of Y
for i=1 to n	
L=1	
for j=1 to n	
if j $\neq$ i then L=L*(x0-x(j))/(x(i)-x(j))	
next j	
y0=y0+L*y(i)	
next i	

#### 2.4.4 LOCATION OF GAC SPOTS

GAC values are calculated on board the satellite by the following procedure (paraphrased from the Advanced TIROS-N Program, Programming and Control Handbooks for NOAA-KLM and NOAA-N, Section 5.5.3.2.3):

Processed GAC earth data is derived from the earth view portion of every third AVHRR scan line. The starting AVHRR scan is not specified, but the GAC lines are tagged with the times of the AVHRR scans from which they are derived.

The data for each of the five AVHRR channels is processed in accordance with the following five sample-averaging algorithms:

- (1) Select only every third AVHRR scan line for data processing. Start with the first AVHRR data sample in the selected scan line.
- (2) From the selected scan line, obtain 5 contiguous AVHRR data samples.
- (3) Retain the data from the first four samples, and discard the data from the fifth sample.
- (4) Form a sum by adding together the data from samples 1, 2, 3 and 4. Form the sum in 12-bit precision.

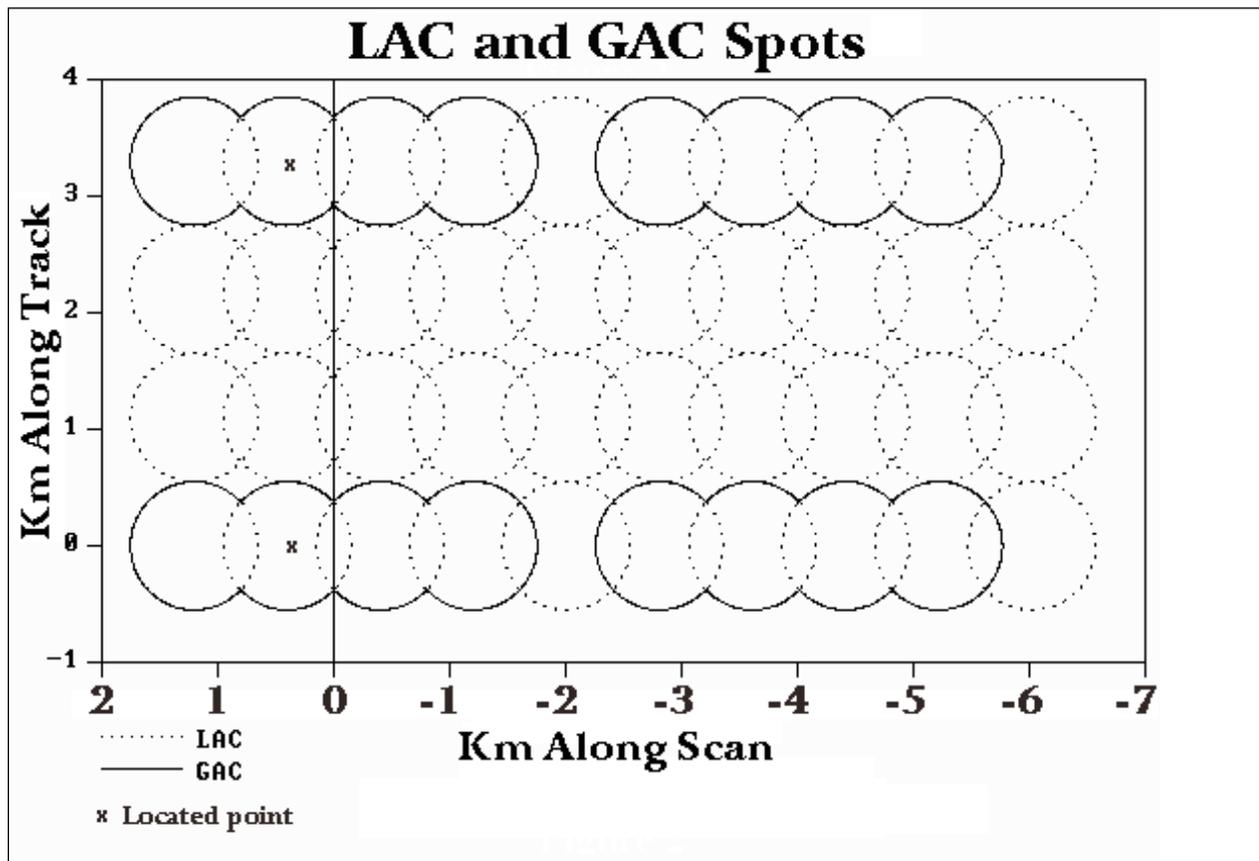

(5) Divide the sum by four to obtain an “averaged” GAC data word. Round the quotient to 10 bits.

(6) Repeat steps (2) through (5), starting with the next AVHRR data sample, for a total of 409 times to generate the required GAC data words for one scan line. Since each AVHRR line includes 2048 data samples, the final 4 samples of the scan line will be skipped.

(7) Repeat steps (1) through (6) for all the AVHRR scan lines.

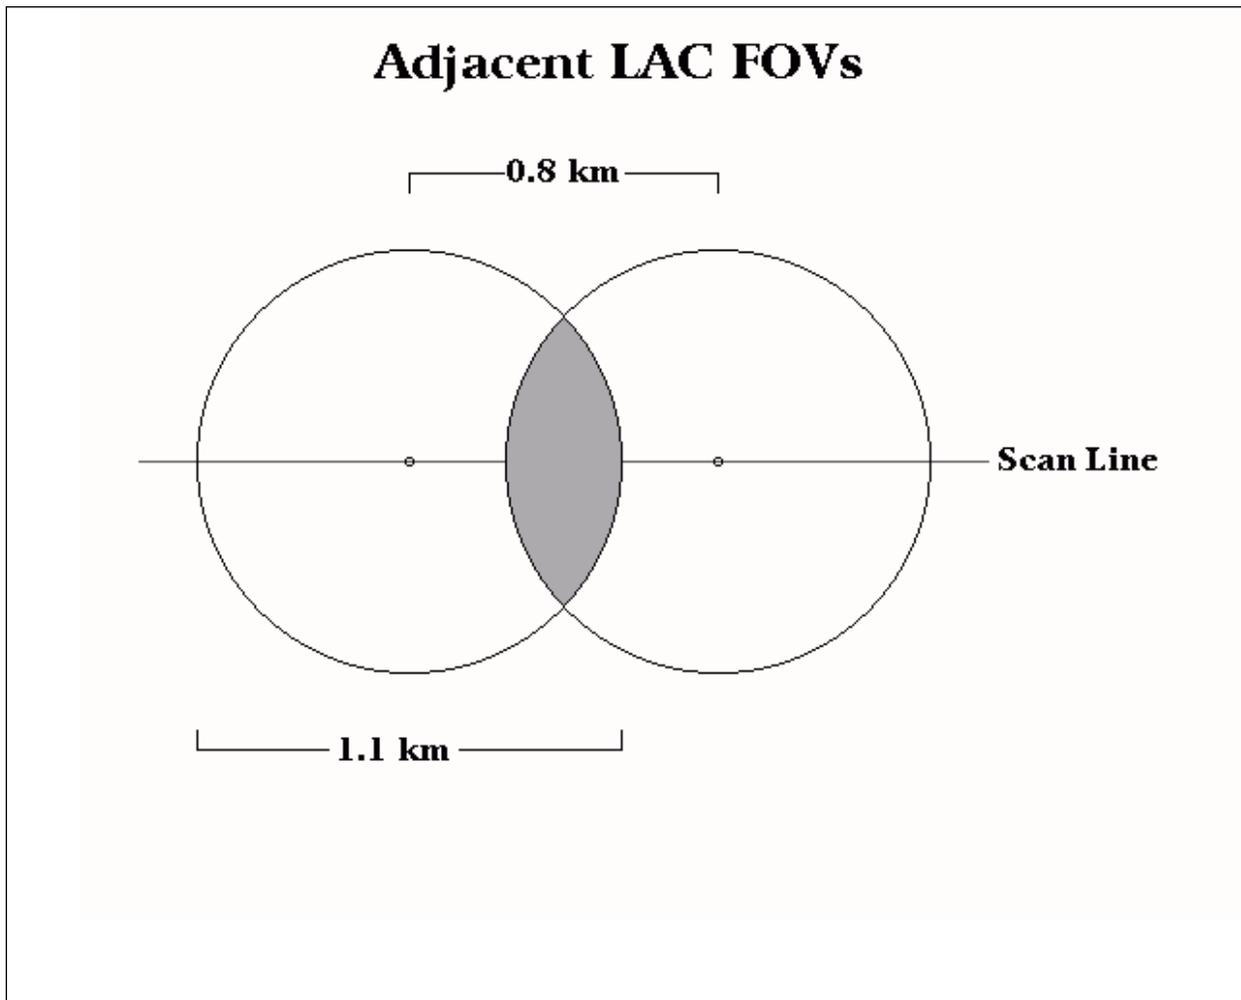

Thus, the first AVHRR data sample of each selected scan line is averaged into the first GAC sample of its line, but the last four AVHRR samples of the line are skipped.

The earth location of the centers of 51 selected AVHRR data samples out of 4028 from each scan line are calculated by the Advanced Earth Location Data System during the preprocessing of the data on the ground, and they are included in the level 1B AVHRR data sets. The 25<sup>th</sup> data sample of a scan and every 40<sup>th</sup> thereafter are selected. These same earth locations are included in GAC level 1B data sets for certain GAC samples. For an earth located GAC spot, the earth location matches the missing AVHRR sample from the 5 used in generating that GAC spot. The 5<sup>th</sup> GAC data sample of each GAC line and every 8<sup>th</sup> sample thereafter are earth located in level 1B.

**Figure 2.4.4-1. Earth Location of LAC and GAC spots near nadir.**

As shown in figure 2.4.4-1, the earth location given for a located GAC spot is NOT that of the center of the spot, the location of the center of the skipped fifth AVHRR spot of the five which constitute a GAC.

**Figure 2.4.4-2. Position of the two LAC spots that straddle nadir.**

Figure 2.4.4-2 shows the two AVHRR spots which straddle the nadir. At this position, the Earth location is displaced 2 kilometers from the center of the corresponding GAC spot (see figure 2.4.4-1). At large angles from nadir, the displacement will be larger, but since the Earth field of view will also be stretched in the scan direction (to 6.5 km for the limbmest AVHRR position), the proportional difference will remain the same.

Figure 2.4.4-2 shows the two LAC spots which straddle nadir. At this position, the Earth location given is displaced 0.4 km from the center of the corresponding GAC spot. At large

nadir angles, the displacement will be larger, but since the Earth field of view will also be stretched in the scan direction (to 6.5 km for the limbwardmost LAC position), the proportional difference will remain the same.

### **3.0 DESCRIPTION OF THE NOAA KLM SENSOR PACKAGE**

This section describes the characteristics of the NOAA KLM series instruments. The normal suite of instruments onboard the NOAA KLM series includes the following instruments: AVHRR/3, HIRS/3, AMSU-A and -B, SEM-2, DCS/2, SARSAT and sometimes SBUV/2. A detailed description of each instrument is provided in the respective subsections shown below. The instrument descriptions contain information such as spectral channel characteristics, system performance characteristics and additional information on the modules or subsystems that comprise the instrument. Table 1.2.1.3-1 provides a list of sensors flown onboard on each NOAA KLM spacecraft.

#### **3.1 ADVANCED VERY HIGH RESOLUTION RADIOMETER/3 (AVHRR/3)**

##### **3.1.1 INSTRUMENT OPERATION**

This section describes the six channel Advanced Very High Resolution Radiometer (AVHRR/3) developed by ITT-A/CD. The AVHRR/3 is used as the meteorological imaging system of the NOAA KLM spacecraft.

The AVHRR/3 is an imaging system in which a small field of view (1.3 milliradians by 1.3 milliradians) is scanned across the earth from one horizon to the other by continuous 360 degree rotation of a flat scanning mirror. The orientation of the scan lines is perpendicular to the spacecraft orbit track and the speed of rotation of the scan mirror is selected so that adjacent scan lines are contiguous at the subsatellite (nadir) position. Complete strip maps of the earth from pole to pole are thus obtained as the spacecraft travels in orbit at an altitude of approximately 833 km (450 n. miles). The analog data output from the sensors is digitized on board the satellite at a rate of 39,936 samples per second per channel. Each sample step corresponds to an angle of scanner rotation of 0.95 milliradians. At this sampling rate, there are 1.362 samples per IFOV. A total of 2048 samples is obtained per channel per Earth scan, which spans an angle of  $\pm 55.4$  degrees from the nadir (subpoint view). All six spectral channels of the AVHRR/3 are registered so that they all measure energy from the same spot on the earth at the same time. All six channels are also calibrated so that the signal amplitude in each channel is a measure of the scene radiance. Although the AVHRR/3 has six channels, only five are transmitted to the ground at any one time. The radiometers are designed to operate within specification for a period of three years in orbit.

##### **3.1.2 SYSTEM DESCRIPTION**

###### **3.1.2.1 General**

The AVHRR/3 is a six channel scanning radiometer providing three solar channels in the visible-near infrared region and three thermal infrared channels. The AVHRR/3 has two one-micrometer wide channels between 10.3 and 12.5 micrometers. The instrument utilizes a 20.32 cm (8 inch) diameter collecting telescope of the reflective Cassegrain type. Cross-track scanning is accomplished by a continuously rotating mirror directly driven by a motor. The three thermal

infrared detectors are cooled to 105 Kelvin (K) by a two-stage passive radiant cooler. A line synchronization signal from the scanner is sent to the spacecraft MIRP which in turn sends data sample pulses back to the AVHRR. Although AVHRR/3 is a six channel radiometer, only five channels are transmitted to the ground at any given time. Channels 3A and 3B cannot operate simultaneously. The data from the six channels are simultaneously sampled at a 40 kHz rate and converted to 10-bit binary form within the instrument. The data samples from each channel are output in a non-continuous burst of 10 space samples, 2048 Earth samples, and 10 internal calibration target samples per scan.

A summary of the AVHRR/3 spectral characteristics and system performance characteristics are given in Tables 3.1.2.1-1 and 3.1.2.1-2, respectively.

<b>Table 3.1.2.1-1. Summary of AVHRR/3 Spectral Channel Characteristics.</b>

Rate	39.936 kpps
Amplitude	5.0V
<b>Electronic Calibration</b>	
Ramp-Cal (during space view)	1024 levels
Volt-Cal (during earth scene)	3 levels

AVHRR/3 data is sampled only at specified times during the Earth scene and backscan regions of each scan period and not on a continuous basis.

Visible Channels 1, 2 and 3A have dual slope gain characteristics with slope intercepts as shown in Table 3.1.2.1-3.

<b>Table 3.1.2.1-3. AVHRR/3 Visible Channel Gain and Intercept Characteristics.</b>		
<b>Channel</b>	<b>% Albedo</b>	<b>Counts</b>
1, 2	0-25% 26-100%	0-500 501-1023
3A	12.5% 12.6-100%	0-500 501-1023

The data from each of the five active channels is digitized in the radiometer to a 10-bit word and brought out of the instrument as a 10-bit parallel digital output to the spacecraft MIRP. In addition to these digital signals, the line synchronization signal is also routed to the MIRP on a separate buffer isolated line.

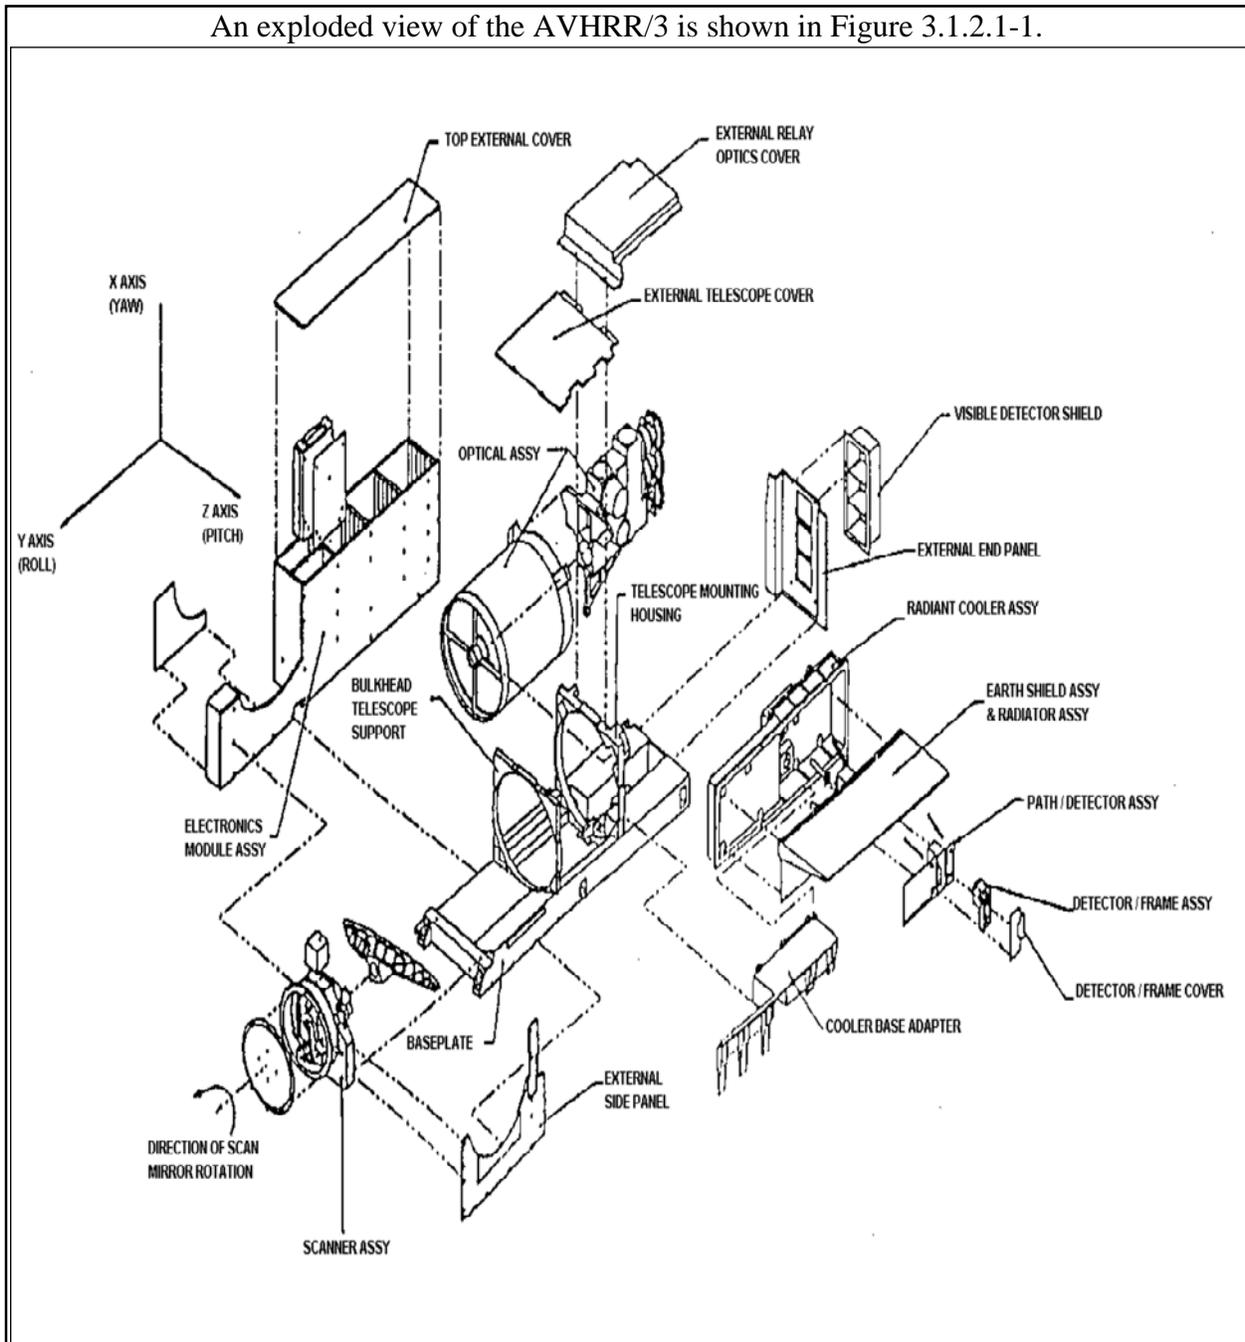

Some differences exist when switching between Channels 3A and 3B. The Channel 3A Select and Channel 3B Select commands are received and stored in a latching relay. A set of contacts in this relay is used to indicate the relay status virtually instantaneously through the digital telemetry. The second set of contacts in the relay switches a logic level on the A/D logic board, which, in turn, is used by the A/D sample and hold board to switch the A/D input between Channel 3A and Channel 3B. This same logic level is also used by the 3A/3B select flag circuitry. Since the command relay is asynchronous, the data output will switch instantaneously between 3A and 3B, even if the scan is in the middle of a line. The select flag circuitry, however, operates differently.

When Channel 3B is selected, the patch temperature data is output every scan line (during the backscan), and every other scan line when 3A is selected. When switching from 3B to 3A, the zero volt marker between lines 5 and 6 indicates that they switched sometime during line 4. Therefore, there is one scan line of uncertainty when switching from 3B to 3A. When switching from 3A to 3B, the presence of patch temperature data between lines 11 and 12 indicates that the switch occurred sometime between lines 9 and 12. Therefore, there are two scan lines of uncertainty when switching from 3A to 3B.

The AVHRR/3 is comprised of five modules which are assembled together into a single unit instrument. These modules are:

- Scanner Module
- Electronics Module
- Radiant Cooler Module
- Optical Subsystem
- Baseplate Unit

An exploded view of the AVHRR/3 is shown in Figure 3.1.2.1-1.

### 3.1.2.2 Scanner Module

This module includes the scan motor, the mirror, and the scan motor housing. The scan motor is an 80 pole hysteresis synchronous motor. The motor has two power modes of operation and is normally operated in the high-power mode (~4.5 watts) in orbit in order to minimize scan line jitter. The scanner housing is an integral part of the motor and is made of beryllium. The scan mirror is also made of beryllium and is ~29.5 cm (11.6 inches) across the major axis and 20.96

cm (8.25 inches) across the minor axis. The scan motor rotates the mirror at 360 rpm to produce a contiguous scan of the Earth scene. The line-to-line jitter is less than  $\pm 17$  microseconds. See Appendix J.1 for specific scan parameters and patterns of the AVHRR/3 instrument.

### 3.1.2.3 Electronics Module

The electronics module is in two sections, both of which bolt onto the instruments' inboard side panel. The curved box (Reference Figure 3.1.2.1-1) is the motor power supply. Thirty electronic circuit assemblies are used to make up the electrical system of the AVHRR/3. Twenty-two of these are located in the electronics box. The preamplifiers for Channels 1, 2, and 3A are located on the relay optics assembly. The IR Channel 4 and Channel 5 preamplifiers are located on the optics side of the electronics box. Channel 3B preamplifier is located near the 3B detector on the radiant cooler. Channels 4 and 5 preamplifier modules are accessible without the removal of the instrument from the spacecraft.

### 3.1.2.4 Radiant Cooler Module

The radiant cooler module is made up of four basic assemblies. These are (1) the cooler housing, (2) the first stage radiator, (3) the patch or second stage radiator and (4) the cooler cover. The first stage radiator is configured in such a manner as to shade most of its radiating area from the Earth by the cooler cover when the cover is deployed. A solenoid is used to deploy the cover. Once deployed, the cover cannot be closed. Mounted on the cold (105K) patch are the three thermal infrared detectors. The patch has a  $144.5 \text{ cm}^2$  ( $22.4 \text{ in}^2$ ) radiating area.

Multi layer insulation thermally separates the first stage radiator from the housing, and the first stage optical window is thermally isolated and heated several degrees warmer than the 171 K radiator temperature to prevent condensation on it. During nominal operation the patch temperature is temperature controlled to 105 K.

### 3.1.2.5 Optical Subsystem

The optical subsystem consists of two subassemblies, a collecting telescope and a relay optics unit. The telescope is a 20.3 cm (8.0 inch) diameter aperture, reflective Cassegrain of a focal design (collimated output). The relay optics split the telescope exit beam into six discrete spectral bands and focus them onto their respective field stops. The spectral bands are:

- Channel 1: 0.58 to 0.68 micrometers
- Channel 2: 0.725 to 1.00 micrometers
- Channel 3A: 1.58 to 1.64 micrometers
- Channel 3B: 3.55 to 3.93 micrometers

- Channel 4: 10.3 to 11.3 micrometers
- Channel 5: 11.5 to 12.5 micrometers

The instantaneous field of view is 1.3 by 1.3 milliradians in all channels and is defined by an aperture plate in Channels 1, 2, and 3A and by the detector active areas in Channels 3B, 4, and 5. In addition, the optical subsystem has been designed to meet the total system MTF requirements with the detectors laterally displaced for channel-to-channel registration.

Polarization effects have been minimized in Channels 1, 2, and 3A by passing the optical beam transmitted by the first visible/infrared beamsplitter through a second beamsplitter of the same type which is oriented so as to compensate for polarization introduced by the first beamsplitter.

#### 3.1.2.6 Baseplate Unit

The baseplate unit is the common structure to which all other modules are secured. Dowel pins are used to establish and maintain alignment of the scanner and optics modules. Alignment of the cooler to the optics is established by shims.

#### 3.1.3 MIRP PROCESSING

This section is provided as an overview of the AVHRR/3 data processing that takes place in the Spacecraft Manipulated Information Rate Processor (MIRP). The MIRP sends a data sample pulse to the AVHRR/3 digital output timing logic which results in the sequential transfer of a data word for each radiometric channel. The MIRP processes these data into the following four outputs.

##### 3.1.3.1 Automatic Picture Transmission (APT)

Any two of the six AVHRR/3 channels can be command-selected for processing. This data undergoes the following:

- (a) Resolution reduction by using every third scan line of AVHRR data.
- (b) Geometric correction to reduce the perspective effect due to the Earth's curvature and the satellite altitude. Details are contained in Section 4.2.
- (c) Digital to Analog - The digitally processed APT data are converted to a 2080 Hz bandwidth analog signal, amplitude modulated onto a 2.4 kHz carrier, and bandwidth limited to 4160 Hz in preparation for transmission by the VHF transmitters.

##### 3.1.3.2 Global Area Coverage (GAC)

MIRP produces the GAC output by combining processed AVHRR/3 data with the TIP data. The GAC frame rate is 2 frames per sec; that is, it is one third of the AVHRR/3 frame rate. The GAC processing of the AVHRR/3 data makes the frame rates directly compatible by only using the data from every third AVHRR/3 scan. The MIRP further reduces the data by averaging the value of four adjacent samples and skipping one sample of each channel of AVHRR data across each scan line used. The TIP word and frame rate is directly compatible with the GAC word and frame rate; five TIP minor frames are inserted (at 0.1 seconds per frame) into the GAC frame each 0.5 seconds. Two parity bits are added to the 8-bit TIP word to form the 10-bit GAC word. The GAC output is supplied only to the spacecraft DTR Input Selector Unit of the XSU, and it is, therefore, not available for direct readout users.

### 3.1.3.3 High Resolution Picture Transmission (HRPT)

MIRP produces the HRPT and the LAC outputs by combining unprocessed AVHRR/3 data with TIP data. The basic frame rate and data rate of the HRPT is compatible with the AVHRR/3. Therefore, only buffering is required to construct the HRPT frame from the AVHRR/3 data. However, since the TIP frame rate is only one third that required to fill the HRPT frame, the TIP data must be repeated three times. This is accomplished by repeating the five TIP minor frames (104 words each) in each of three HRPT frames. As in GAC, two parity bits are added to the 8-bit TIP word to form the 10-bit MIRP word. The HRPT output is supplied to the S-band transmitter input control for real-time transmission.

### 3.1.3.4 Local Area Cover (LAC)

LAC is, by definition, recorded HRPT; thus, the LAC output is supplied only to the spacecraft DTR input selector for recording.

## **3.2 HIGH RESOLUTION INFRARED RADIATION SOUNDER (HIRS)**

The first High Resolution Infrared Radiation Sounder (HIRS) instrument was developed and flown in 1975 on the Nimbus 6 satellite. Results from the Nimbus 6 orbital data and system studies showed promise of obtaining data from which improved atmospheric soundings could be derived. The basic design for the Nimbus HIRS system was modified to accommodate the TIROS-N series of spacecraft with TIROS-N orbital requirements, to improve the sensor performance, and to increase the reliability of the filter wheel drive assembly. This HIRS/2 design was used in the protoflight and seven flight models and further improved to become HIRS/2I. Three HIRS/2I units were built. Additional improvements and operational changes were made for the HIRS/3. Three HIRS/3 instruments were built for use on the NOAA KLM spacecraft.

The HIRS/4 design is a modification of the HIRS/3 design, built to fly on the NOAA-N, -N' spacecraft. The design changes for the HIRS/4 consist of: 1) radiant cooler operation at 95 K; 2) IFOV size reduced to 10 km; 3) inclusion of a fifth Internal Warm Target (IWT) temperature sensor; and 4) addition of a tertiary telescope temperature sensor. Section 3.2.1 specifically

discusses the HIRS/3 instrument (flown on NOAA KLM), while Section 3.2.2 contains descriptions of the HIRS/4 instrument (flown on NOAA-N and -N’).

### 3.2.1 HIRS/3

#### 3.2.1.1 Instrument Operation

The High Resolution Infrared Radiation Sounder (HIRS/3) is a discrete stepping, line-scan instrument designed to measure scene radiance in 20 spectral bands to permit the calculation of the vertical temperature profile from Earth's surface to about 40 km.

Multispectral data from one visible channel (0.69 micrometers), seven shortwave channels (3.7 to 4.6 micrometers) and twelve longwave channels (6.5 to 15 micrometers) are obtained from a single telescope and a rotating filter wheel containing twenty individual filters. An elliptical scan mirror provides cross-track scanning of 56 increments of 1.8 degrees. The mirror steps rapidly (<35 msec), then holds at each position while the 20 filter segments are sampled. This action takes place each 100 msec. The instantaneous FOV for each channel is approximately 1.4 degrees in the visible and shortwave IR and 1.3 degrees in the longwave IR band which, from an altitude of 833 kilometers, encompasses an area of 20.3 kilometers and 18.9 kilometers in diameter, respectively, at nadir on the Earth.

Three detectors are used to sense the radiation. A silicon photodiode at the instrument temperature (nominally 15 degrees C) detects the visible energy. An Indium Antimonide detector and a Mercury Cadmium Telluride detector (mounted on a passive radiator and operating at 100 K) sense the shortwave and longwave IR energy. The shortwave and visible optical paths have a common field stop, while the longwave path has an identical but separate field stop. Registration of the fields of view in all channels is largely determined by these stops with secondary effects from detector position.

IR Calibration of the HIRS/3 is provided by programmed views of two radiometric targets: a warm target mounted to the instrument base and a view of space. Data from these views provides sensitivity calibrations for each channel every 40 lines (256 seconds), if commanded. Internally generated electronic signals provide calibration and stability monitoring of the amplifier and readout electronics.

Data from the instrument is multiplexed into a single data stream controlled by the TIP system of the spacecraft. Information from the radiometric channels and voltage telemetry are converted to 13-bit binary data. Radiometric information is processed to produce the maximum dynamic range such that instrument and digitizing noises are a small portion of the signal output. Each channel is characterized by a noise equivalent radiance (NE $\Delta$ N) and a set of calibration data that may be used to derive atmospheric temperatures and probable errors.

The HIRS/3 instrument is a single package mounted on the Instrument Mounting Platform (IMP) of the NOAA KLM spacecraft. Thermal blankets cover most outer surfaces other than that of the radiating panel and door area. The cooler radiating surface views space, emitting its heat to

provide passive radiant cooling of the shortwave and longwave detectors to the stabilized 100K operating temperature. An Earth shield on the cooler door assembly insulates the door from Earth direction thermal input. The door is closed during launch and through the initial orbital outgas period (at least 14 days). After this outgas period, the door is opened permanently for cooling of the radiator. If there are indications of contaminate accumulation subsequently, a door-open outgas procedure can be performed by applying power to the heaters located on both stages of the radiant cooler. During this procedure, the cooler temperature rises to approximately 300 K.

Table 3.2.1.1-1 lists the system characteristics of the HIRS/3 Instrument. Table 3.2.1.1-2 lists the spectral channel and sensitivity requirements for the HIRS/3. See Appendix J.2 for specific scan parameters and patterns of the HIRS/3 instrument.

<b>Table 3.2.1.1-1. HIRS/3 System Characteristics.</b>	
<b>Characteristic</b>	<b>Value</b>
Optical Field of View	1.4 degrees VIS/SW IR 1.3 degrees LW IR
Included Energy	98% within 1.80 degrees
Channel to channel registration	LW: <1.5% of 1.8 degrees Step size SW: <1% of Ch. 19 FOV FWHM
Earth Scan Angle	±49.5 degrees from nadir

### 3.2.1.2 System Description

#### 3.2.1.2.1 Introduction

The HIRS/3 is a 20-channel scanning radiometric sounder utilizing a stepping mirror to accomplish cross-track scanning, directing the radiant energy from the Earth to a single, 15.24 cm (6-inch) diameter telescope assembly every tenth of a second. Collected energy is separated by a beamsplitter into longwave (above 6.5 micrometers) and shortwave (visible to 4.6 micrometers), passed through field stops and through a rotating filter wheel to cooled detectors. In the shortwave path, a second beamsplitter separates the visible channel to a silicon detector.

The scan logic and control set the sequence of Earth viewing steps to provide a rapid scan mirror step motion to 56 fixed positions for spectral sampling of each respective air column. The filter wheel rotation is synchronized to this step and hold sequence, with approximately one-third of the wheel blank to accommodate each step interval and with the filters positioned for sampling only after the mirror has reached the hold position. Registration of the optical fields for each channel to a given column of air is dependent to some degree on spacecraft motion and on the alignment of two field stops, which can be adjusted to reduce registration error to less than 1 percent of the field diameter.

The characteristics of the instrument temperature sensors are shown in Table 3.2.1.2.1-1, where it may be noted that calibration sources are measured very precisely.

<b>Table 3.2.1.2.1-1. HIRS/3 Sensor Temperature Ranges.</b>

* Housekeeping TLM (full time temperature monitoring on switched +28 VDC BUS)				

Radiant energy is focused on cooled detectors operating at a near optimum temperature of 100K. A Mercury Cadmium Telluride detector and an Indium Antimonide detector are mounted on a two-stage radiant cooler. This assembly is large enough to have reserve cooling capacity, permitting active thermal control to maintain the detectors fixed at 100K. A system of heating the patch and first stage is provided for initial outgassing and for decontamination later if it should be required.

Electronic circuits provide the functions of power conversion, command, telemetry, and signal processing. Amplification of the inherently weak signals from the detectors is done by low noise amplifiers. Radiant signals are fed through a base reference and memory processor, multiplexed, and A/D converted by a 13-bit range system. Once converted to a digital format, the data are again multiplexed with HIRS/3 "housekeeping" data and provided as a serial data stream at the digital A output. Data from HIRS/3 are held in memory until called by the TIP request signals and clocked out of the instrument by the TIP clock.

Repetitive inclusion of electronic calibration signals and the periodic command to scan to space and one internal blackbody provides the system with a complete set of data collection, calibration, and control that permits reliable operation in orbit.

### 3.2.1.2.2 Scan System Description

The heart of the scan system is a stepper motor with 200 steps per rotation. Assembled to the shaft of the stepper motor are (1) a scan mirror mounted with the mirror surface plane at 45 degrees with respect to the axis of the motor shaft, (2) a DC torque motor, (3) a DC tachometer, (4) a shaft position encoder, and (5) a two contact slip ring assembly. The DC tachometer is used to derive rate information which is used to control a DC torque motor to aid stopping of the scan rotation as the scan settles into a track position or into a step position.

The drive control signals for the stepper motor are generated by a step generator which has input control features for retrotorque control, step/slew control and rotational direction control (up/down). Output from a scan regulator with power level control is applied to the motor driver to provide stepping torque levels as required.

The Scan Control logic utilizes timing signals and position commands in conjunction with position information derived from a position encoder to monitor and control performance of the system. Connections to a thermal sensor on the scan mirror are provided via two leads from the mirror through the hollow motor shaft to a slip ring assembly at the opposite end of the shaft.

### 3.2.1.3 Calibration Requirements

The Calibration Enable command enables the radiometric calibration control logic. Calibration is activated by the calibration start pulse (CSP) which occurs every 256 seconds. The CSP initiates a sequence of scans that provide radiometric calibration of the instrument. When the Calibration Disable command is in effect, the CSP will be ignored and the instrument will continue its normal scan sequence.

### 3.2.1.4 HIRS/3 Digital “A” Data

Digital “A” data is clocked into the spacecraft TIP whenever the “A<sub>1</sub>” Data Enable Pulse is presented to the instrument. A full set of HIRS/3 operational data, including command status monitors, housekeeping information and radiance data of the 20 channels, is contained in the Digital “A” output. The HIRS/3 data repeats every 6.4 seconds as described below. The 6.4 second period contains 64 elements.

Digital “A” output is divided into “Elements” of 288 bits. One element is phased to fit into a TIP minor frame. The TIP allocates 36 8-bit words to accommodate the HIRS/3 element. These TIP words are then grouped by two in fixed locations throughout the 100 millisecond minor frame.

Sixty-four elements make up each scan. The formats for the elements repeat every 6.4 seconds and correspond to the particular parts of the scan. Elements number 0 through 55 are earth scan data (target data during the calibration sequence). Elements 56 through 63 are associated with retrace or when the mirror is slewing between positions. The elements are divided as follows:

#### Bits 1-26

Two 13 bit words have the same function in all 64 elements. The function assembled in these words is described in Table 3.2.1.4-1.

<b>Table 3.2.1.4-1. Functions of Bits 1-26 in the HIRS/3 Elements.</b>			
<b>Word #</b>	<b>Bits</b>	<b>Function</b>	<b>Range (Decimal)</b>
1	1-8	Scan Encoder Position	0 to 199
	9-13	Electronic Cal Level Indicator	0 to 31
2	1 - 6	Channel 1 Period Monitor	0 to 63

	7-12	Element Number	0 to 63
	13	Filter Sync Designator	n/a

#### Bits 27-286

This group of bits is divided into 20 13-bit words. The word functions are dependent on element number. These functions are given in Table 3.2.4-2. Except for the two status words in Element 63, all words are quantity where bit 1 is the sign bit and bits 2 through 13 are amplitude (0 to 4095). Bit 2 is the most significant bit (MSB) of quantity. The sign bit is: logic "1" is + and logic "0" is -.

#### Bits 287 and 288

In the same manner as for bits 1 through 26, these two bits have the same function in all 64 elements as shown in Table 3.2.1.4-2.

<b>Table 3.2.1.4-2. Functions of Bits 287-288 in the HIRS/3 Elements.</b>		
<b>Bits</b>	<b>Function</b>	<b>Remarks</b>
287	Valid Data Bit	logic "1" Valid Data logic "0" Ignore Radiometric Data
288	Odd Bit Parity	n/a

One HIRS/3 word is contained in two contiguous 8-bit TIP words. These two words occur in 1.899 msec. Eighteen pairs, each consisting of two Minor Frames TIP words, are required per minor frame. These eighteen words make up one HIRS/3 Element. The Digital "A" output is a serial output of 288 bits per element. The first bit (Bit 1) occurs in the MSB of TIP word 14.

Tables 3.2.4-3 and 3.2.4-4 contain the HIRS/3 Digital "A" Radiometric and housekeeping functions, and the Digital "A" Status Telemetry, respectively.

**Table 3.2.1.4-3. HIRS/3 Digital “A” Radiometric and Housekeeping Functions.**

<b>Element #</b>	<b>Bit #</b>	<b>Function</b>	<b>Remarks</b>
0 – 55	27-39	Radiometric Channel No. 1 (668.5 cm <sup>-1</sup> )	0 counts radiance from scene equal radiance from Filter Wheel (FW). Minus (-) values are colder than FW. Plus (+) values are warmer than FW.
	40-52	Radiometric Channel No. 17 (2,420 cm <sup>-1</sup> )	0 counts offset from FW radiance. Plus and minus are hotter and cooler than offset.
	53-65	Radiometric Channel No. 2 (680 cm <sup>-1</sup> )	No offset.
	66-78	Radiometric Channel No. 3 (690 cm <sup>-1</sup> )	No offset.
	79-91	Radiometric Channel No. 13 (2,188 cm <sup>-1</sup> )	Offset.
	92-104	Radiometric Channel No. 4 (703 cm <sup>-1</sup> )	No offset.
	105-117	Radiometric Channel No. 18 (2515 cm <sup>-1</sup> )	Offset.
	118-130	Radiometric Channel No. 11 (1365 cm <sup>-1</sup> )	No offset.
	131-143	Radiometric Channel No. 19 (2,660 cm <sup>-1</sup> )	Offset.
	144-156	Radiometric Channel No. 17 (749 cm <sup>-1</sup> )	No offset.
	157-169	Radiometric Channel No. 8 (900 cm <sup>-1</sup> )	No offset.
	170-182	Radiometric Channel No. 20 Visible (14,500 cm <sup>-1</sup> )	Black is minus. White is plus.
	183-195	Radiometric Channel No. 10 (802 cm <sup>-1</sup> )	No offset.

	196-208	Radiometric Channel No. 14 (2,210 cm <sup>-1</sup> )	Offset.
	209-221	Radiometric Channel No. 6 (749 cm <sup>-1</sup> )	No offset.
	222-234	Radiometric Channel No. 5 (716 cm <sup>-1</sup> )	No offset.
	235-247	Radiometric Channel No. 15 (2,235 cm <sup>-1</sup> )	Offset.
	248-260	Radiometric Channel No. 12 (1,533 cm <sup>-1</sup> )	No offset.
	261-273	Radiometric Channel No. 16 (2,245 cm <sup>-1</sup> )	Offset.
	274-286	Radiometric Channel No. 9 (1,030 cm <sup>-1</sup> )	Offset.
56	27-286	Positive Electronics Calibration applied to 20 radiometric channels.	Calibration level advances one of the 32 equal level steps on successive scans. The offset and gain of each channel will influence the amplitude of the signal. The calibration level applied to the (continued) electronic channels is indicated by bits 9 through 13 of the Element.
57	27-286	Negative Electronics Calibration applied to 20 radiometric channels.	Calibration level advances one of the 32 equal level steps on successive scans. The offset and gain of each channel will influence the amplitude of the signal. The calibration level applied to the (continued) electronic channels is indicated by bits 9 through 13 of the Element.
58	27-91	Internal Warm Target Temperature Sensor #1	Value repeated 5 times. Range 273 to 333 K.

	92-156	Temperature Sensor #2	Value repeated 5 times. Range 273 to 333 K.
	157-221	Temperature Sensor #3	Value repeated 5 times. Range 273 to 333 K.
	222-286	Temperature Sensor #4	Value repeated 5 times. Range 273 to 333 K.
59	27-91	Internal Cold Target Temperature Sensor #1	Value repeated 5 times. Range 243 to 303 K.
	92-156	Temperature Sensor #2	Value repeated 5 times. Range 243 to 303 K.
	157-221	Temperature Sensor #3	Value repeated 5 times. Range 243 to 303 K.
	222-286	Temperature Sensor #4	Value repeated 5 times. Range 243 to 303 K.
60	27-91	Filter Wheel Housing Temperature Sensor #1	Value repeated 5 times. Range 273 to 333K.
	92-156	Temperature Sensor #2	Value repeated 5 times. Range 243 to 303 K.
	157-221	Temperature Sensor #3	Value repeated 5 times. Range 243 to 303 K.
	221-286	Temperature Sensor #4	Value repeated 5 times. Range 243 to 303 K.
61	27-91	Patch Temperature Expanded Scale	Value repeated 5 times. Range 90 to 150 K.
	92-156	First Stage Radiator Temperature Sensor	Value repeated 5 times. Range 150 to 320 K.
	157-221	Filter Wheel Housing Heater Current	Value repeated 5 times. Range 0 to 500 ma.
	222-286	Electronic Calibration Digital to Analog Converter	Value repeated 5 times. Range 0 to 4 V.
62	27-39	Scan Mirror Temperature	Range 260 to 320 K
	40-52	Primary Telescope Temperature	Range 260 to 320 K

	53-65	Secondary Telescope Temperature	Range 260 to 320 K
	66-78	HIRS/3 Baseplate Temperature	Range 260 to 320 K
	79-91	HIRS/3 Electronics Temperature	Range 260 to 320 K
	92-104	Patch Temperature - Full Range	Range 90 to 320 K
	105-117	Scan Motor Temperature	Range 260 to 320 K
	118-130	Filter Wheel Motor Temperature	Range 260 to 320 K
	131-143	Cooler Housing Temperature	Range 260 to 320 K
	144-156	Patch Control Power	Range 0 to 80 mW
	157-169	Scan Motor Current	Range 0.65 to 1.0 ma
	170-182	Filter Motor Current	Range 100 to 300 ma
	183-195	+15 VDC	Range $15 \pm 0.2$ V
	196-208	-15 VDC	Range $-15 \pm 0.2$ V
	209-221	+7.5 VDC	Range $+7.5 \pm 0.05$ V
	222-234	-7.5 VDC	Range $-7.5 \pm 0.05$ V
	235-247	+10 VDC	Range $10 \pm 0.2$ V
	248-260	+5 VDC	Range $5 \pm 0.2$ V
	261-273	Analog Ground	Range 1 count
	274-286	Analog Ground	Range $\pm 1$ count
63	27-39	Line Counter (Gives the number of lines from the last auto calibration sequence)	0 to 8191 (There is no sign bit used in the line counter). Reset to 0 counts is only when counter overflows.
	40-52	First Status Word	First 5 bits are instrument serial number (no sign bit). The remaining bits indicate status as shown in Table 3.2.1.4-4.

	53-65	Second Status Word	First 5 bits are zero fill. The remaining bits indicate status as shown in Table 3.2.1.4-4.
	66-78	Data Verification Binary Code	Binary code is: (1 1 1 1 0 0 1 0 0 0 1 1) Equivalent base10 value: +3875
	79-91		Base 10 value: +1443
	92-104		Base 10 value: -1522
	105-117		Base 10 value: -1882
	118-130		Base 10 value: -1631

### 3.2.2 HIRS/4

#### 3.2.2.1 Instrument Operation

The HIRS/4 instrument provides multispectral data from one visible channel (0.69  $\mu\text{m}$ ), seven shortwave channels (3.7 to 4.6  $\mu\text{m}$ ) and twelve longwave channels (6.7 to 15  $\mu\text{m}$ ) using a single telescope and a rotating filter wheel containing twenty individual spectral filters. An elliptical scan mirror provides cross-track scanning of 56 steps in increments of 1.8 degrees. The mirror steps rapidly (<35 msec), then holds at each position while the optical radiation, passing through the 20 spectral filters, is sampled. This action takes place each 0.1 second. The instantaneous field of view for each channel is approximately 0.7 degrees which, from a spacecraft altitude of 833 km, encompasses a circular area of 10 km at nadir on the earth.

Three detectors are used to sense the optical radiation. A silicon photodiode, at nominal instrument temperature (15 C), detects the visible radiation. An Indium Antimonide detector and Mercury Cadmium Telluride detector (mounted on a passive radiator and operating at 95 K) sense the shortwave and longwave IR radiation, respectively. The shortwave and visible optical paths have a common field stop, while the longwave path has an identical but separate field stop. Size and registration of the optical fields of view in all channels is determined by these stops.

IR calibration of the HIRS/4 is provided by programmed views of two radiometric targets: the warm target mounted on the instrument baseplate, and a view of space. Data from these views provides sensitivity calibrations for each channel at 256 second intervals if commanded. Internally generated electronic signals provide calibration and stability monitoring of the detector amplifier and signal processing electronics.

Data from the instrument (including radiometric and telemetry information) is multiplexed into a single data stream which is controlled by the TIROS Information Processor (TIP) system in the NOAA-N, -N' spacecraft. Information from the radiometric channels and voltage telemetry are converted into 13 bit binary data. Radiometric information is processed to utilize the maximum dynamic range of the A/D Converter, such that instrument generated digitizing noise is a small portion of the output signal. Each spectral channel is characterized by a noise equivalent radiance and radiance vs. output counts calibration data that may be used to derive atmospheric temperatures and probable errors.

The HIRS/4 instrument is contained within a single package which is mounted on the Instrument Mounting Platform (IMP) of the NOAA-N, -N' spacecraft. The cooler radiating surface views space, thereby emitting its heat to provide passive radiant cooling of the shortwave and longwave detectors to the controlled operating temperature of 95 K. The cooler door includes an earth shield which insulates the radiating surfaces of the radiant cooler from earth's thermal radiation. The cooler door is closed during launch and through the initial orbital outgas period. During this procedure, the cooler temperature rises to approximately 300 K. After this outgas period, the door is opened permanently for cooling of the radiator. A door-open outgas procedure can be performed, if indications of contamination become apparent, by applying power to the heaters on both stages of the radiant cooler.

Table 3.2.2.1-1 lists the general characteristics of the HIRS/4 instrument. Table 3.2.2.1-2 lists the spectral channel and sensitivity requirements for the HIRS/4.

<b>Table 3.2.2.1-1. HIRS/4 System Characteristics.</b>	
Optical Field of View (FOV)	0.7 degrees all channels
Included Energy	98% within 1.80 degrees
Channel to channel registration	LW: <1.5% of Ch. 8 FOV FWHM SW: <1 % of Ch. 19 FOV FWHM

Earth Scan Angle	±49.5 degrees from nadir
Earth Scan Steps	56 increments of 1.8 degrees
Scan Step and Dwell Time	100 msec total
Scan, Slew and Retrace Intervals	0.8 seconds
Total Scan Line Time	6.4 seconds
Earth Swath Coverage	1127 km
Radiometric Calibration	286 K Internal Blackbody and Space Look
Frequency of Calibration	256 seconds
Dwell Time at Calibration Positions	5.6 seconds at IWT, 4.8 seconds at space
Longwave Channels	12 (6.5 to 15 μm)
Longwave Detector	Mercury Cadmium Telluride
Shortwave Channels	7 (3.7 to 4.6 μm)
Shortwave Detector	Indium Antimonide
IR Detectors Temperature	95 K
Visible Channel	1 (0.69 μm)
Visible Detector	Silicon
Visible Detector Temperature	Instrument Ambient
Signal Quantizing Levels	8192 (13 bit coding)
Electronic Calibration	32 equal levels (bipolar)
Frequency of Electronic Calibration	One level each scan line
Telescope Aperture	15.0 cm (5.9 inches)
Filters Temperature	290 K (with baseplate at 283 K)

### 3.2.2.2 System Description

#### 3.2.2.2.1 Introduction

The HIRS/4 is a 20-channel scanning radiometric sounder. It utilizes a stepping mirror to accomplish crosstrack scanning to direct the radiant energy from a 10 km nominal diameter area on the Earth into a 15 cm diameter telescope every tenth of a second. Collected energy is separated by a dichroic beamsplitter into longwave (above 6.5  $\mu\text{m}$ ) and shortwave (visible to 4.6  $\mu\text{m}$ ) components. The IR energy then passes through field stops, a rotating filter wheel and onto two cooled IR detectors. In the shortwave path, a second beamsplitter separates and directs the visible energy to a silicon detector which is at instrument ambient temperature.

The scan control and logic circuitry sets the sequence of Earth viewing steps to provide a rapid scan mirror step motion to each of 56 fixed positions for spectral sampling of each respective atmospheric column. The filter wheel rotation is synchronized to this step and hold sequence. Approximately one fourth of the wheel is blank to provide for the time required for each step interval. The filters are thus in position for sampling only after the mirror has reached the hold position. Registration of the optical fields for each channel to a given column of the atmosphere is dependent largely on the alignment of two field stops which are adjusted to reduce residual registration error to less than two percent of the field diameter and to a lesser degree, on spacecraft motion.

Radiant energy is focused onto cooled IR detectors operating at a temperature of 95 K. A longwave (LW) Mercury Cadmium Telluride (HgCdTe) detector and shortwave (SW) Indium Antimonide (InSb) detector are mounted on a two stage passive radiant cooler. This cooler has sufficient reserve cooling capacity to permit active thermal control to maintain the detectors at 95 K. The cooler and its housing are designed to minimize condensation of contaminants on critical components. Windows on the housing and first stage control external thermal input and prevent transport of contaminants to the detectors. Baffles and traps capture condensable contaminants in other areas. A system for heating the patch and first stage provides for initial orbital outgassing and for decontamination later, should it be necessary. The cold first stage windows are heated several degrees above the surrounding area, reducing contaminant condensation on their surfaces.

The HIRS/4 radiant cooler is an improved version of that used in the HIRS/3 instruments. Changes include mounting of the SW Preamplifier on the cooled patch, and adding an aperture of the vacuum housing windows to reduce thermal inputs. The cooler has an operating point of 95 K versus 100K for the HIRS/3 and a control margin of at least 5 K at 95K.

Electronic circuits provide the functions of power conversion, command, telemetry and signal processing. Initial amplification of the signals from the IR detectors is done in two low noise preamplifiers. The visible detector signal uses a separate preamplifier but joins the shortwave just after the shortwave preamplifier. Radiant signals are fed through a base reference, a memory processor, analog multiplexer, and an A/D converter with a 13-bit range. Once converted to digital format, the data are again multiplexed with “housekeeping” telemetry data

and provided as a serial data stream at the Digital “A” Output. Data from one scan element, or minor frame are held in one side of a dual path ping-pong memory until called by the TIROS Information Processor (TIP). While one side of the ping-pong memory is transferring data to the TIP, the other side is being loaded real-time with data for the next scan element. The data is sequenced out of the instrument by the TIP data clock.

Table 3.2.2.2.1-1 shows the sensor temperature ranges for the HIRS/4 instrument.

<b>Table 3.2.2.2.1-1. HIRS/4 Sensor Temperature Ranges.</b>					
<b>Channel Sensor Location</b>	<b>Subcomm Analog (K)</b>	<b>Digital “A” (K)</b>	<b>Approx. Digital “A” Sensitivity (Counts/K)</b>	<b>Nominal @ Operating Temperatures</b>	<b>Notes</b>
Patch - full range	90-320	90-320	53	@95K	2
Patch - expanded range		90-150	141	@95K

<b>Notes:</b> 1. Housekeeping TLM (full time temperature monitoring on switched +28 vDC TLM BUS) 2. PRT, all others are thermistors.					

#### 3.2.2.2.2 Scan System Description

An elliptical scan mirror provides cross-track scanning of 56 steps in increments of 1.8°. The mirror steps rapidly (<35 msec), then holds at each position while the optical radiation, passing through the 20 spectral filters, is sampled. This action takes place each 0.1 second. The instantaneous field of view for each channel is approximately 0.7° which, from a spacecraft altitude of 833 km, encompasses a circular area of 10 km in diameter at nadir on the Earth.

#### 3.2.2.3 Calibration Requirements

IR calibration of the HIRS/4 is provided by programmed views of two radiometric targets: the warm target mounted on the instrument baseplate, and a view of space. Data from these views provides sensitivity calibrations for each channel at 256 second intervals if commanded. Internally generated electronic signals provide calibration and stability monitoring of the detector amplifier and signal processing electronics.

#### 3.2.2.4 HIRS/4 Digital “A” Data

Digital “A” data from the instrument is described in Table 3.2.2.4-1. The TIP clock pulse (C<sub>1</sub>) and Data Enable pulses determine the time at which this data is called out. The TIP formatter calls out groups of 8-bit words in a sequence that multiplexes HIRS/4 data with that of other instruments on the NOAA-N, N’ spacecraft. Along with this requirement, the large quantity of instrument data to be transmitted and the use of 13-bit encoding for radiometric data, it was not possible to format the data into 8-bit segments. The HIRS/4 data is therefore provided as a continuous stream composed of 13-bit word lengths but clocked out in 8-bit words by the TIP. During any Minor Frame there are 288 bits of HIRS data which are extracted at an equivalent 8,320 bps rate.

The data format remains the same during the 56 Earth scan element time periods. During retrace, which is an interval of eight Earth scan element time periods, the data format is changed to provide for measurement of the internal electronic calibration and to sample all of the Housekeeping telemetry data.

Scan Element 0 contains the data which describes the scene at the time of viewing the first scan position. The scan positions are described later, but it should be noted that encoder position "1" occurs at the first Earth scan position and hence will be the encoder position noted during element "0". Scan element 55 designates the last Earth scan position. Scan Elements 56-63 occur during the scan mirror retrace during normal Earth scanning. These same element number designations apply also when the scan is commanded to a calibration target during the automatic calibration (Autocal) sequence. Normally, the mirror slewing motion between calibration targets takes place during the normal retrace interval except for the case of slew to the space look position where the motion occurs during scan elements 0 to 7. Therefore, space look during Autocal is only for 48 elements (8 through 55).

In order to determine when radiometric data should not be used, a Valid Data Bit is included in the data stream. This bit is a "1" when all conditions are normal and the radiometric data may be considered good. It will be "0" when the scan system is in a slew mode.

The electronic calibration level advances one level per scan line from 0 to 31, defining the step level measured in each radiometric channel during elements 56 and 57. Since both a positive and negative calibration is made during a scan line, the same level values apply for both.

The Channel 1 Period Monitor measures the time interval of the travel from the Channel 1 to the Channel 2 segments of the filter wheel on each rotation. The reading measures 1.248 MHz clock intervals during that segment, hence defines filter wheel rotation time with a resolution variation of 0.8 microseconds. This is not used in normal system data processing or evaluation but is a powerful diagnostic tool to aid in assessing the filter wheel subsystem health.

With every filter wheel revolution, a block of data is generated. This block, called an element, is 288 bits long. A scan line consists of 56 scene views and 8 retrace elements. Thus, there are 64 (56 + 8) filter wheel revolutions per line and 64 elements per scan line. Each element is numbered 0 through 63 and this 6-bit binary number is included in each element as bit location 20-25.

Filter Sync Designator is a "1" when the filter wheel is in synchronism with the data control timing system. This is diagnostic data not normally used in data collection or processing. If the Filter Sync Designator is "0" the radiometric data is not valid.

Radiant Signal Output is the 13-bit binary level measurement of the signals coming from the various detectors. The first bit is a sign bit ("1" positive, "0" is negative). The remaining twelve data bits are straight binary code in order from the most significant to least significant bit.

Minor Word Parity Check is the last bit of each minor Frame or data element and is inserted to make the total number of “ones” in that data element odd. This permits checking for loss of data integrity between transmission from the instrument and reconstruction on the ground.

Elements 58-61 contain the outputs of the temperature sensors and the ECAL DAC, sampled five times during each element. This approach provides a more accurate measurement of the more critical sensor temperatures.

In Element 62, the data multiplexer connects other voltage and temperature sensors outputs into the A/D converter for one sample each, thereby allowing monitoring of all the major test points in the system.

Element 63 contains the command status, the instrument serial number, the total line number since the last radiometric calibration (in 13-bit natural binary), and a fixed word pattern and fill bits.

Instrument Serial Number is unique for each instrument. The HIRS/4 instruments are designated 015 and 016.

Command Status is a tabulation of the state of the command relays and its complete format is contained in Table 3.2.2.4-1.

<b>Table 3.2.2.4-1. HIRS/4 Digital “A” Data Output Format.</b>			
<b>Element #</b>	<b>Bit #</b>	<b>Function</b>	<b>Range Counts</b>
0 - 55 (Earth Scan Elements)	1-8	Encoder Position	0 to 200
	9-13	Electronic Cal Level	0 to 31
	14-19	Channel 1 Period Monitor	0 to 63
	20-25	Element Number	0 to 63
	26	Filter Sync Designator	0 or 1
	27-286	Radiant Signal Output (20 channels x 13 bits)	0 to ±4095

### 3.3 ADVANCED MICROWAVE SOUNDING UNIT-A (AMSU-A)

#### 3.3.1 INSTRUMENT OPERATION

The Advanced Microwave Sounding Unit-A (AMSU-A) system is implemented in two separate modules: the AMSU-A1 and AMSU-A2. The AMSU-A is a multi-channel microwave radiometer that is used for measuring global atmospheric temperature profiles and provides information on atmospheric water in all of its forms (with the exception of small ice particles, which are transparent at microwave frequencies) from the NOAA KLM spacecraft.

AMSU-A is a cross-track, line-scanned instrument designed to measure scene radiances in 15 discrete frequency channels which permit the calculation of the vertical temperature profile from about 3 millibars (45 km) pressure height to the Earth's surface. At each channel frequency, the antenna beamwidth is a constant 3.3 degrees (at the half power point). Thirty contiguous scene resolution cells are sampled in a stepped-scan fashion every eight seconds, each scan covering 50 degrees on each side of the subsatellite path. These scan patterns and geometric resolution translate to a 50 km diameter cell at nadir and a 2,343 km swath width from the 833 km nominal orbital altitude.

## 3.3.2 SYSTEM DESCRIPTION

### 3.3.2.1 General

Hardware for the two lowest frequencies is located in one module (AMSU-A2) and that for the remaining thirteen frequencies in the second module (AMSU-A1). This arrangement puts the two lower atmospheric moisture viewing channels into one module and the oxygen absorption channels into a second common module to ensure commonality of viewing angle independent of any module and/or spacecraft misalignment due to structural or thermal distortions. The AMSU-A1's concept of multiplexing thirteen frequencies in this second module is provided by a two-antenna system. This multiplexing approach provides minimum front-end RF loss and a constant 3.3 degree antenna beamwidth with greater than 95 percent beam efficiency. The radiometer characteristics of the AMSU-A channels are summarized in Table 3.3.2.1-1.

**Table 3.3.2.1-1. Channel Characteristics and Specifications of AMSU-A**

<sup>1</sup>H indicates horizontal and V indicates vertical polarization

AMSU-A1 consists of 12 V-band channels (3 through 14) and one W-band channel (15) and associated circuitry. This module provides a complete and accurate vertical temperature profile of the atmosphere from the Earth's surface to a height of approximately 45 km.

AMSU-A2 contains the two lower frequencies (K-band channel 1 and Ka-band channel 2), and the associated scanning, calibration, processing, and power control hardware and circuitry. This module is used to study atmospheric water in all of its forms with the exception of small ice particles.

AMSU-A is configured in the following major subsystems: Antenna/Drive/Calibration Subsystem; Receiver Subsystem; Signal Processor Subsystem and Structural/Thermal Subsystem.

The AMSU microwave radiometers are heterodyne receivers, where the received radio frequency (RF) is downconverted to a lower intermediate frequency (IF). The relationship between the RF and IF signals is shown in Figure 3.3.2.1-1.

Given the IF filter band edge frequencies,  $f_1$  and  $f_2$ , and the central frequency,  $f_0$ , the frequency response of a channel can be fully characterized (assuming unity response for all channels).

For the AMSU instruments, there are three types of channels:

1. Single passband channels (AMSU-A 1-4, 6-9, 15; and AMSU-B 16 and 17),
2. Double sideband channels (AMSU-A 5, 10; and AMSU-B 18-20), and
3. Quadruple sideband channels (AMSU-A 11-14).

Single passband channels can be defined as those whose bandwidth span the channel central frequency, as shown in Figure 3.3.2.1-2. Typically for these channels, stopbands are specified to reduce the effects of local oscillator noise (source of the central frequency signal). The frequency range for these channels can be expressed as:

$$f_0 - SHW - HW \rightarrow f_0 - SHW \tag{3.3.2.1-1}$$

and

$$f_0 + SHW \rightarrow f_0 + SHW + HW \tag{3.3.2.1-2}$$

Figure 3.3.2.1-1. Frequency translation of a broadband signal in heterodyne reception. Adapted from Figure 1.9b in "Atmospheric Remote Sensing by Microwave Radiometry," M. Janssen ed., John Wiley, 1993.

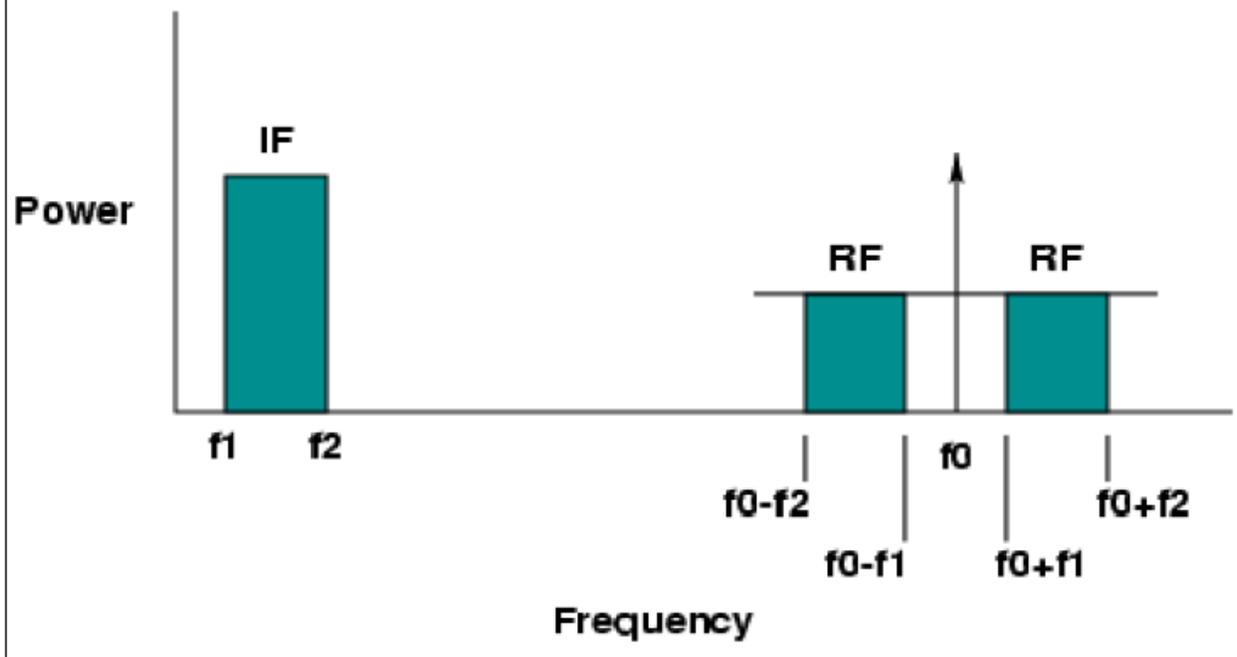

Figure 3.3.2.1-1 Frequency translation of a broadband signal in heterodyne reception.

to exclude the stopband frequencies. Comparison to Figure 3.3.2.1-1 would give:

$$f_1 \approx SHW \text{ and } f_2 \approx SHW + HW \quad (3.2.2.1-3)$$

For those AMSU channels that have relatively narrow stopbands (channels 1-4, 6-9; around 18MHz) the difference between calculating Planck radiances using the frequency response shown in equations 3.3.2.1-1 and 3.3.2.1-2 and a simple  $f_0 - HW \rightarrow f_0 + HW$  is a fraction of a thousandth of a degree. Note for AMSU channels 15-17, the stopband widths are about 800-1000 MHz and should always be considered.

Figure 3.3.2.1-2. Schematic illustration of a single passband channel. AMSU-A channels 1-4, 6-9, and 15; and AMSU-B channels 16 and 17 are considered single passband channels.

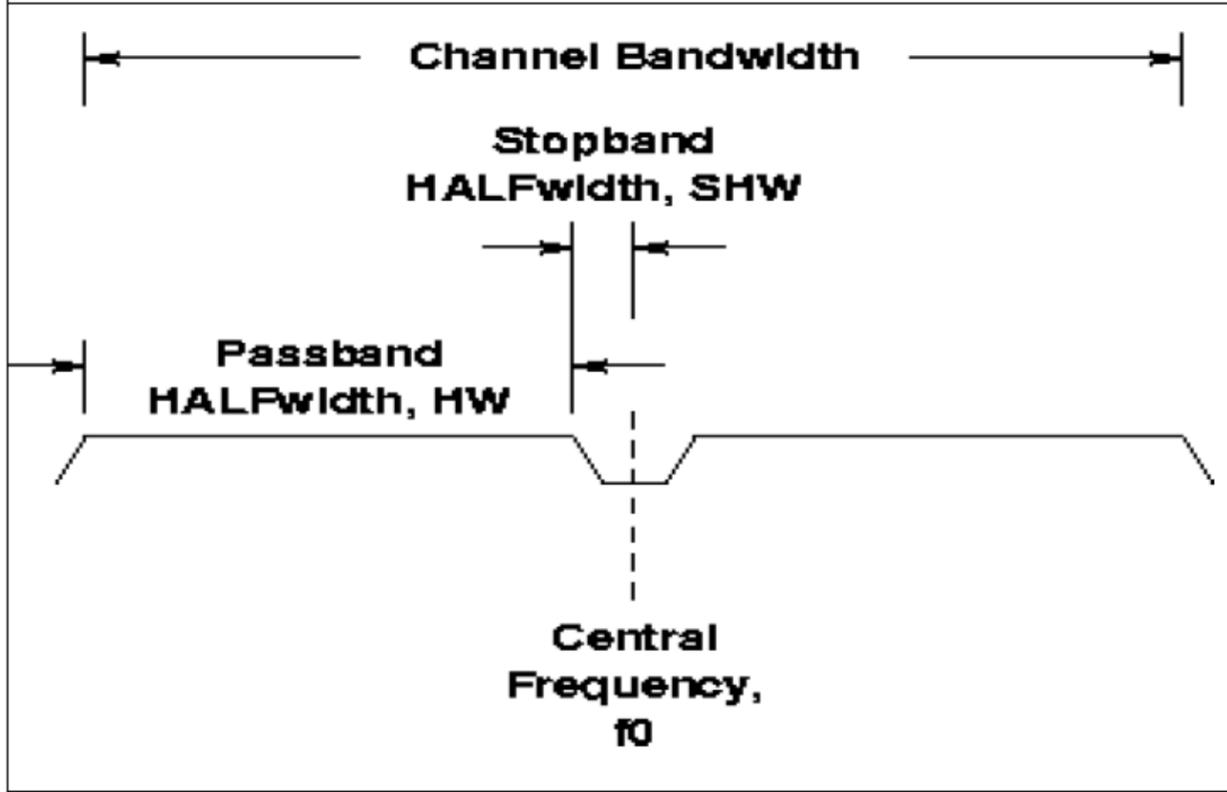

Figure 3.3.2.1-2. Schematic illustration of a single passband channel.

Double sideband channels are shown schematically in Figure 3.3.2.1-3. These channels are also referred to as folded passbands with the lower frequency sideband referred to as the lower sideband and the higher frequency sideband being the upper sideband. For these channels the frequency response of the lower sideband can be expressed as:

$$f_0 - df - HW \rightarrow f_0 - df + HW \quad (3.3.2.1-4)$$

For the upper sideband, it can be expressed as:

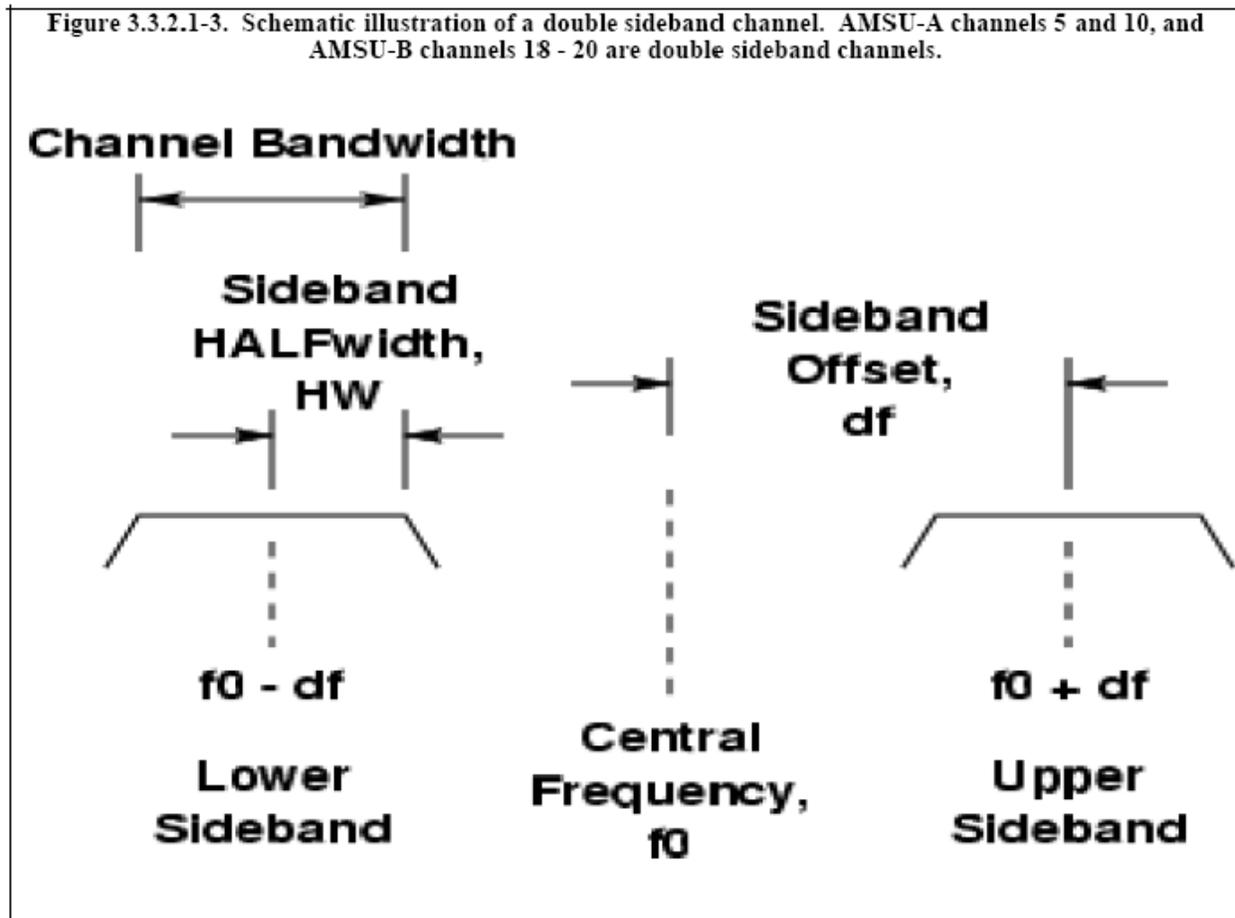

$$f_0 + df - HW \rightarrow f_0 + df + HW \quad (3.3.2.1-5)$$

Comparison to Figure 3.3.2.1-1 would give,

$$f_1 \equiv df - HW \quad \text{and} \quad f_2 \equiv df + HW \quad (3.3.2.1-6)$$

where  $df$  is the offset to the *center* of the sideband.

Quadruple sideband channels are shown schematically in figure 3.3.2.1-4. They resemble two double sideband “subchannels” on either side of the channel central frequency (Note: “subchannels” is not a common or rigorous term and is used here for explanation only).

**Figure 3.3.2.1-3. Schematic illustration of a double sideband channel.**

For the lower “subchannels,” the frequency response can be expressed as:

$$f_0 - df_1 - df_2 - UHW \rightarrow f_0 - df_1 - df_2 + UWH \quad (3.3.2.1-7)$$

and

$$f_0 - df_1 + df_2 - LHW \rightarrow f_0 - df_1 + df_2 + LHW$$

and for the upper “subchannels” the frequency response can be expressed as:

$$f_0 + df_1 - df_2 - LHW \rightarrow f_0 + df_1 - df_2 + LWH \quad (3.3.2.1-8)$$

and

$$f_0 + df_1 + df_2 - UHW \rightarrow f_0 + df_1 + df_2 + UHW$$

Comparison to Figure 3.3.2.1-1 gives four IF values. Two for the lower sideband:

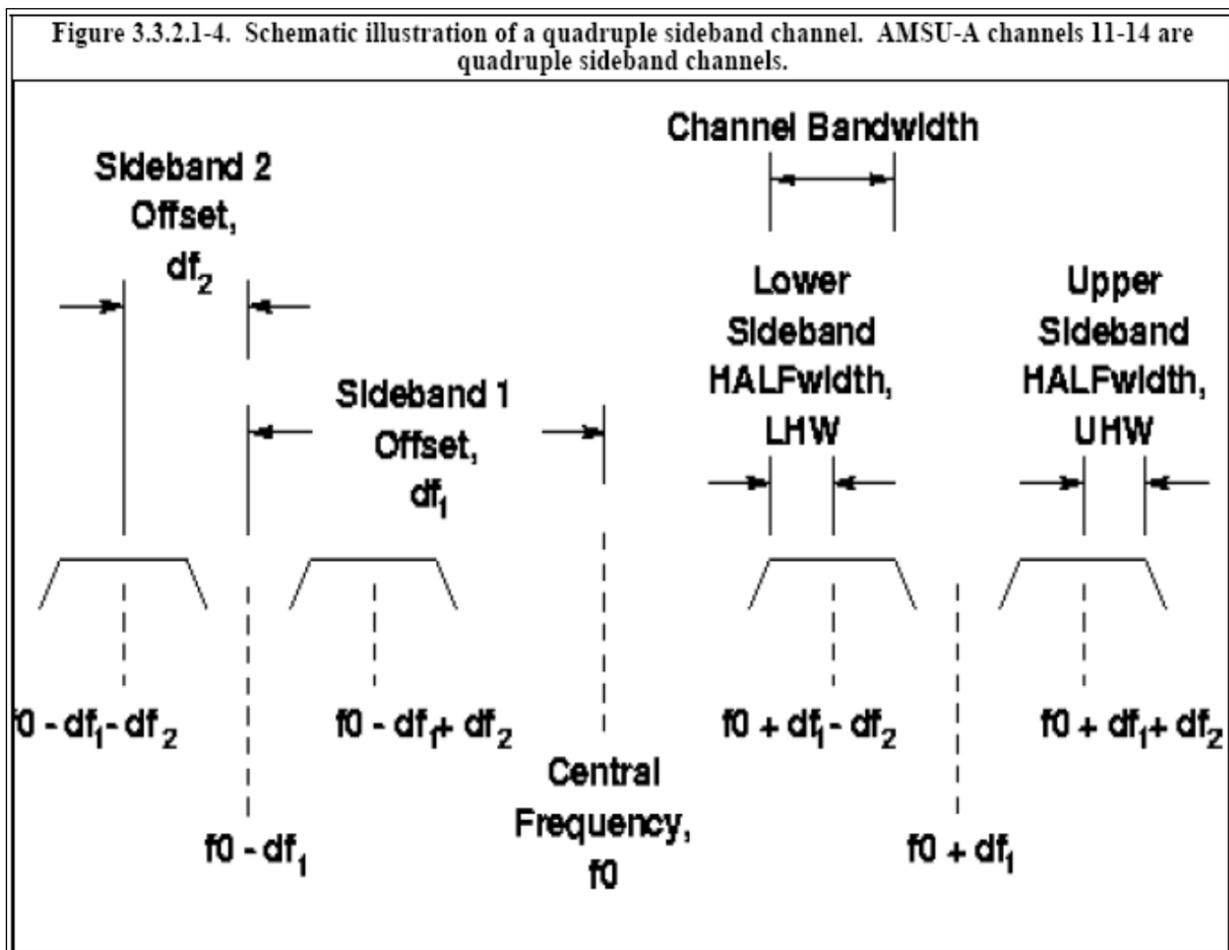

$$f_1 \equiv df_1 - df_2 - LHW \text{ and } f_2 \equiv df_1 - df_2 + LHW \quad (3.3.2.1-9)$$

and two for the upper sideband:

$$f_3 \equiv df_1 + df_2 - UHW \text{ and } f_4 \equiv df_1 + df_2 + UHW \quad (3.3.2.1-10)$$

where  $df_1$  and  $df_2$  are the offsets to the center of the sidebands.

**Figure 3.3.2.1-4. Schematic illustration of a quadruple sideband channel.**

### 3.3.2.2 Antenna/Drive/Calibration System

The Antenna/Drive/Calibration subsystem consists of a conical corrugated horn-fed shrouded reflector, multiplexer, closed-loop antenna scan drive assembly and closed path calibration assembly. The shrouded reflector is rotated once every scan line (8 sec) for:

- each of 30 earth viewing scene observations,

The Antenna/Drive/Calibration subsystem consists of a conical corrugated horn-fed shrouded reflector, multiplexer, closed-loop antenna scan drive assembly and closed path calibration assembly. The shrouded reflector is rotated once every scan line (8 sec) for:

- each of 30 earth viewing scene observations,
- a view of the cosmic background (~2.73 K), and
- a view of a warm calibration load (~300 K).

During the rotation cycle, the shroud prevents solar reflections from interacting with the warm load and also ensures maximum coupling of the source radiation to the antenna feed. A complete end-to-end in-flight calibration is achieved in a through-the-antenna method, which provides maximum in-flight calibration accuracy. The accuracy of the warm calibration load brightness temperature is better than  $\pm 0.2$  K. The closed loop antenna scan drive provides beam pointing accuracy within  $\pm 0.2$  degrees. A resolver in the antenna drive assembly provides antenna beam position information.

The AMSU-A1 modules contain two antenna assemblies: designated A1-1 and A1-2. Antenna A1-1 is located the farthest from Earth in-flight and provides inputs to channels 6 and 7 and channels 9 through 15. A1-2 is located closest to Earth in-flight and provides input to channels 3 through 5 and 8. Table 3.3.2.2-1 shows the number of PRTs contained in each of the AMSU-A modules. Figures 3.3.2.2-1 and 3.3.2.2-2 show actual photos from NASA for AMSU-A1 and AMSU-A2.

<b>Table 3.3.2.2-1. The number of PRTs in each AMSU-A module.</b>		
<b>Instrument</b>		<b>Number of PRTs</b>
<b>AMSU-A1</b>	<b>A1-1</b>	<b>5*</b>
	<b>A1-2</b>	<b>5*</b>
<b>AMSU-A2</b>		<b>7*</b>
*The number of PRTs specified for each calibration target in the AMSU-A instrument is four: Five were provided for AMSU-A1 and seven for AMSU-A2. The NOAA-K AMSU-A1 has one of the five PRTs inoperable.		

The antenna beam width of all AMSU-A channels is 3.3 degrees. The beamwidth is defined as the half-power points beamwidth (HPBW). The beamwidth in any plane containing the main

beam axis (electrical boresight axis) is within  $\pm 10\%$  of the 3.3 degree value. Beamwidth variation from channel to channel is smaller than 10% of the specified beamwidth value.

The polarization angle changes as a function of the scan angle. The polarization angle is defined as the magnitude of the angle between the electric field vector of the incoming radiation and a line which is the intersection of a plane perpendicular to the propagation direction of the incoming radiation and a plane tangent to the earth surface. Scan angle is defined as the angle between nadir and the antenna electrical boresight direction. Vertical polarization is defined as having the polarized vector in the sun-nadir plane when the beam is pointing at nadir. Horizontal polarization is defined as having the polarization vector in the velocity-nadir plane when the beam is pointing at nadir.

Each channel of the AMSU-A is considered to form a beam. All main beam axes of the AMSU-A are coincidental, i.e., they are pointing in the same direction at the same time for any given beam position. The AMSU-A beams have cross-track scanning. All beams scan in a plane perpendicular to the spacecraft orbital velocity vector. The sense of the scan is counter clockwise as one looks along the spacecraft orbital velocity direction, namely, the antenna scans from the sun direction through nadir to the cold space direction.

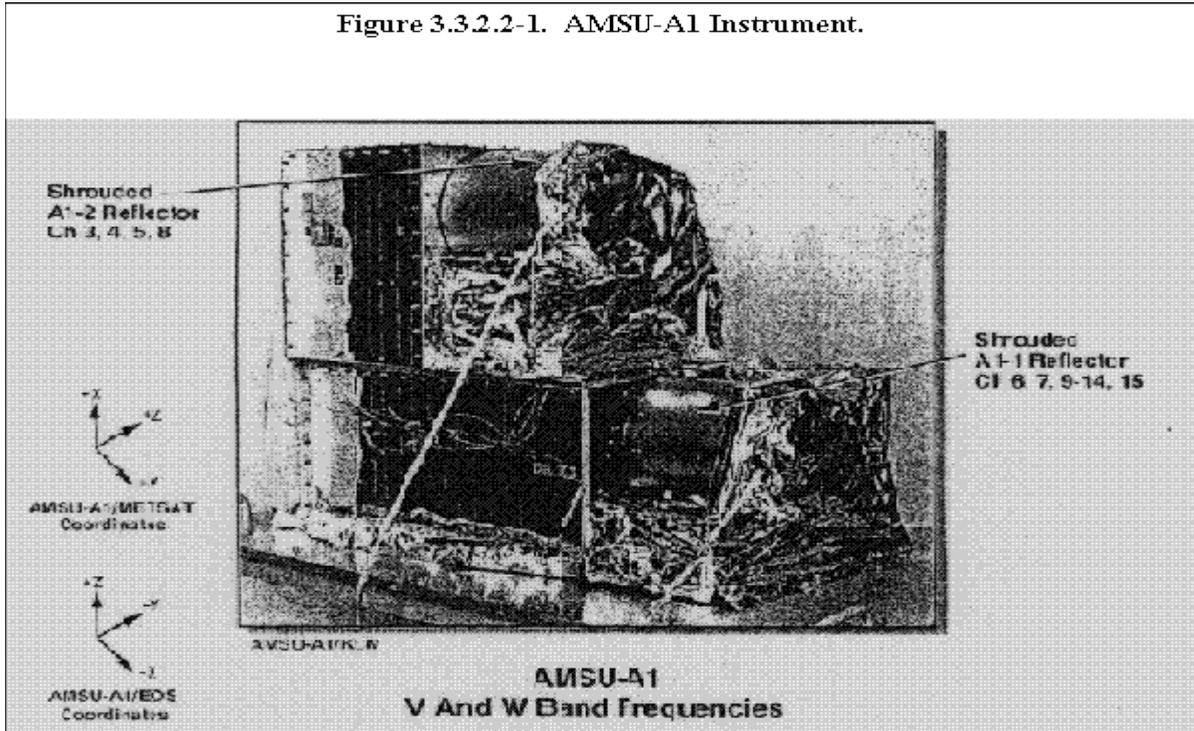

The scanning profile of AMSU-A is a “step” scan type. The instrument’s FOV rotates to a data collection position, stops, collects data, and then moves to the next collection position, stops, collects data, etc. The instrument starts at each earth position 1, then goes sequentially to earth position 30, then to the cold calibration view position, and then to the warm load view position. After the warm load view, the instrument goes back to earth position 1 and the cycle begins again. See Appendix J.3 for specific scan parameters and patterns of the AMSU-A instrument.

The AMSU-A beams scan the earth viewing sector a total of 96.66 degrees ( $\pm 48.33$  degrees from nadir) on beam centers. There is a total of 30 beam positions (30 resolution cells on the earth’s surface), which are called cell numbers 1 through 30, from sun to anti-sun. There are 15 cells on either side of nadir. The beam center position of each cell is separated from the adjacent cell along the scan direction by 3.33 degrees (there is a noncumulative step tolerance of  $\pm 0.04$  degrees).

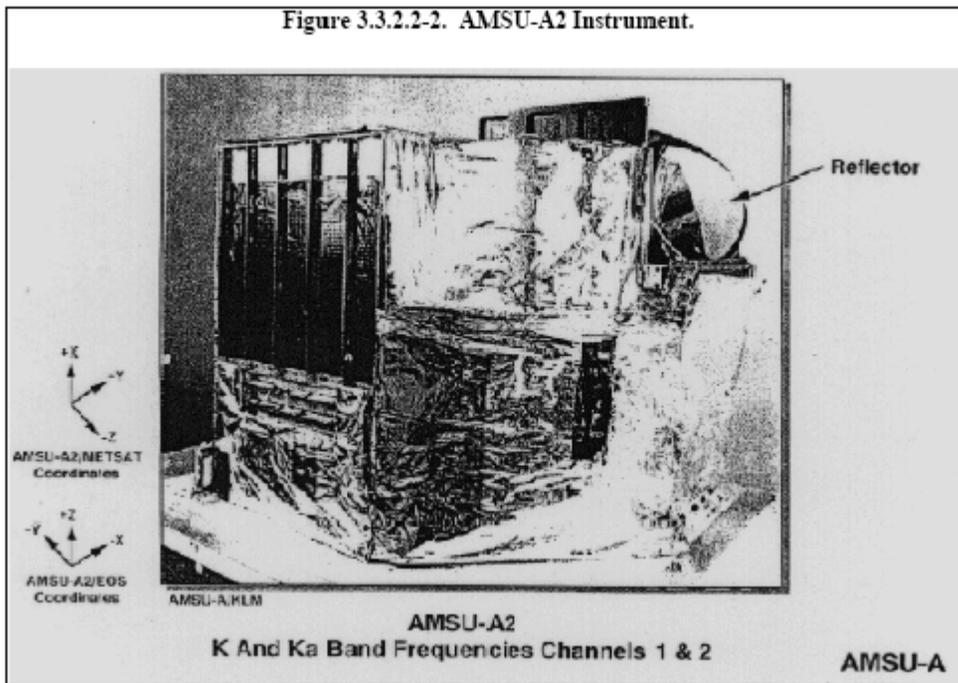

### 3.3.3 CALIBRATION REQUIREMENTS

There are no specific on-orbit calibration procedures for AMSU-A. The instrument is automatically calibrated each data cycle by measuring both warm and cold calibration targets.

**Figure 3.3.2.2-1. AMSU-A1 Instrument.**

**Figure 3.3.2.2-2. AMSU-A2 Instrument.**

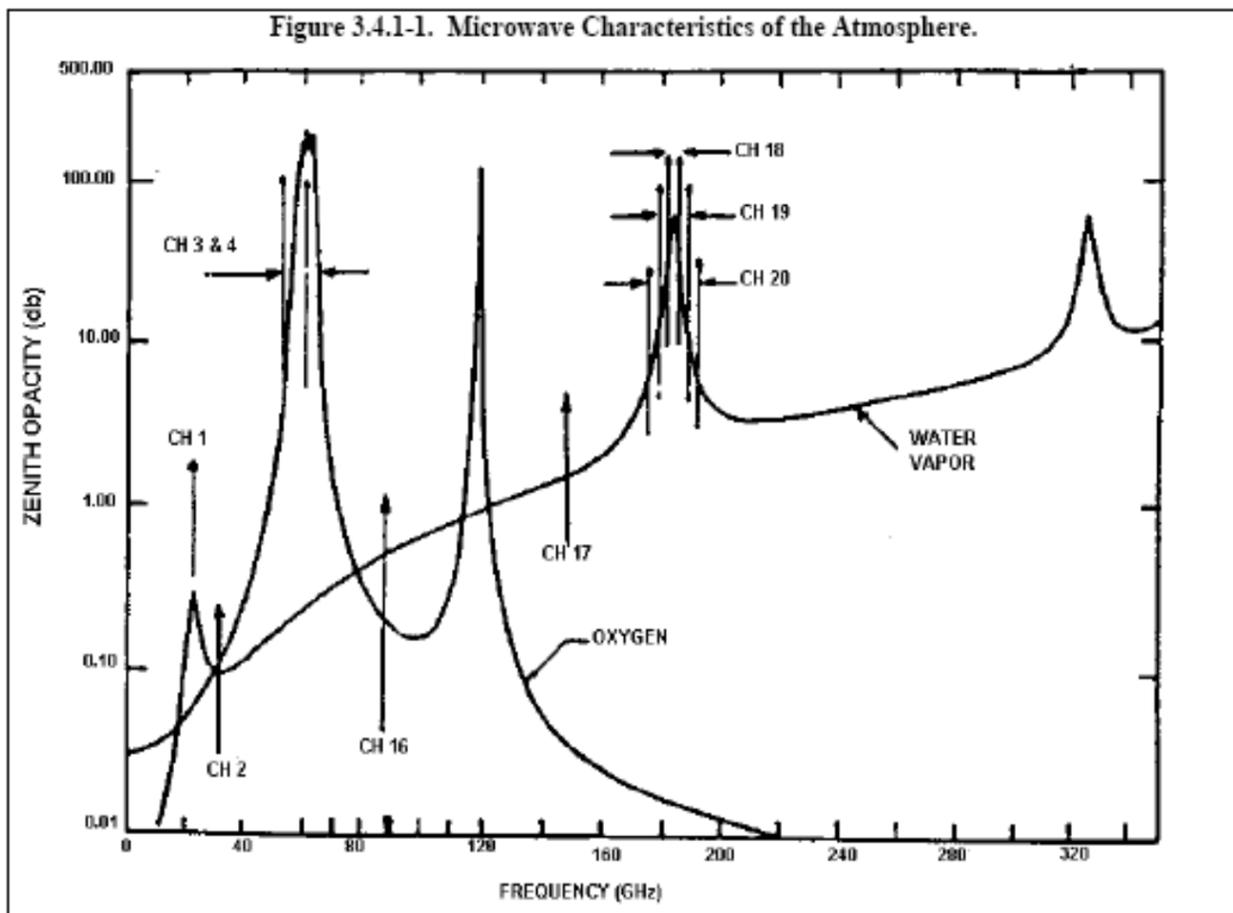

**Figure 3.3.2.2-2 AMSU-A2 Instrument**

### 3.4 ADVANCED MICROWAVE SOUNDING UNIT-B (AMSU-B)

#### 3.4.1 INSTRUMENT OPERATION

The Advanced Microwave Sounding Unit-B (AMSU-B) is a 5 channel microwave radiometer. The purpose of the instrument is to receive and measure radiation from a number of different layers of the atmosphere in order to obtain global data on humidity profiles. It works in conjunction with the AMSU-A instruments to provide a 20 channel microwave radiometer.

The microwave characteristics of the atmosphere are provided in Figure 3.4.1-1. AMSU-B covers channels 16 through 20. The highest channels: 18, 19 and 20, span the strongly opaque water vapor absorption line at 183 GHz and provide data on the atmosphere's humidity level.

**Figure 3.4.1-1 Microwave Characteristics of the Atmosphere.**

Channels 16 and 17, at 89 GHz and 150 GHz, respectively, enable deeper penetration through the atmosphere to the Earth's surface.

AMSU-B is a cross-track, line scanned instrument designed to measure scene radiances in 5 channels. At each channel frequency, the antenna beamwidth is a constant 1.1 degrees (at the half power point). Ninety contiguous scene resolution cells are sampled in a continuous fashion, each scan covering 50 degrees on each side of the subsatellite path. These scan patterns and geometric resolution translate to a 16.3 km diameter cell at nadir at a nominal altitude of 850 km. See Appendix J.3 for specific scan parameters and patterns for AMSU-B.

The AMSU-B instrument consists of a scanning parabolic reflector antenna which is rotated once every 8/3 seconds and focuses incoming radiation into a quasi-optic system which then separates the frequencies of interest into three separate feed horns of the receiver assembly. The receiver subsystem provides further demultiplexing of the 183 GHz signal in order to selectively acquire three defined double sided bands around the 183 GHz signal. The passbands for all five channels are shown in Table 3.4.1-1. The center frequencies for channels 18, 19, and 20 are  $183.31 \pm 1.00$  GHz,  $183.31 \pm 3.00$  GHz, and  $183.31 \pm 7.00$  GHz, respectively. Further information regarding the AMSU-B channels can be found in Section 3.3.2.1

<b>Table 3.4.1-1. AMSU-B Channel Characteristics (based on actual instrument build and measured NE)T from thermal vacuum data).</b>					
<b>Channel Number</b>	<b>Center freq of channel (GHz)</b>	<b>No. of pass bands</b>	<b>Bandwidth per passband (MHz)</b>	<b>NE <math>\Delta T^1</math>(K)</b>	<b>Polarization angle<sup>2</sup></b>
16		2	1000	.37	90-2
17		2	1000	.84	90-2
18		2	500	1.06	902-
19		2	1000	0.70	90-2
20		2	2000	0.60	90-2
<sup>1</sup> Values from first flight model <sup>2</sup> The polarization angle is defined as the angle from the horizontal polarization (i.e., electric field vector parallel to satellite track) where 0 is the scan angle from nadir. In this table, the polarization angle is horizontal when the angle indicated is 0 and vertical is 90-2					

The reflector is rotated in a profiled scan span, in order to provide a constant velocity Earth scan, a low speed scan across an internal calibration source, a low speed scan towards deep space and a scan repeat cycle time that does not allow for constant velocity rotation. The direction of the scan motion is from the sunside (+Z) to nadir (+X) to the antisunside (-Z). During earthscan, motion is continuous with an angular velocity constant to within  $\pm 2\%$ . The deep space and internal blackbody reference views permit a two-point, in-flight calibration. The entire scan profile is achieved through microprocessor control.

Three different data streams are processed and delivered by the instrument to either the spacecraft's AMSU Instrument Processor (AIP) or the TIROS Information Processor (TIP).

Digital data, which consist of earth view pixel data, housekeeping data, and space and blackbody view data, is clocked into the AIP. The TIP samples both digital "B" and analog telemetry. The digital "B" telemetry contains instrument status monitors used to verify commands, and the analog telemetry provides health and safety monitoring of AMSU-B.

### 3.4.2 SYSTEM DESCRIPTION

#### 3.4.2.1 General

The overall purpose of AMSU-B is to receive and measure radiation from a number of different layers within the atmosphere in order to obtain global data on humidity profiles.

The radiation from the atmosphere is viewed by an offset parabolic reflector inclined to the axis of rotation. The antenna is rotated by means of a scanning mechanism which is capable of slewing the antenna between hot and cold calibration references and scanning the antenna to view a swath across the atmosphere. Radiation from the antenna is propagated via a fixed sub-reflector to a quasi-optic feed where it is divided into 89, 150 and 183.3 GHz bands and then to a Microwave Receiver where it is down-converted, amplified and detected. The detected signals are amplified, sampled and averaged under processor control to provide an integration time of 18 msec in each channel. The digital signals are then buffered before being relayed to the satellite bus.

The AMSU-B consists of the following:

- Microwave and Antenna Subsystem (MASS) comprising:
  - Main Reflector/Shroud
  - Subreflector
  - Quasi-Optic Feed
  - Microwave Receiver
  - Calibration Target
- Scanning Mechanism
- Electrical Subsystem comprising:
  - Processing Electronics Unit (PEU)
  - Motor Drive Electronics (MDE) and Inductosyn Control Electronics (ICE)
  - Power Supply Unit (PSU)
  - Electrical Harness
- Structure Subsystem
- Thermal Control Subsystem
- Software

A general configuration view of AMSU-B is shown in Figure 3.4.2.1-1.

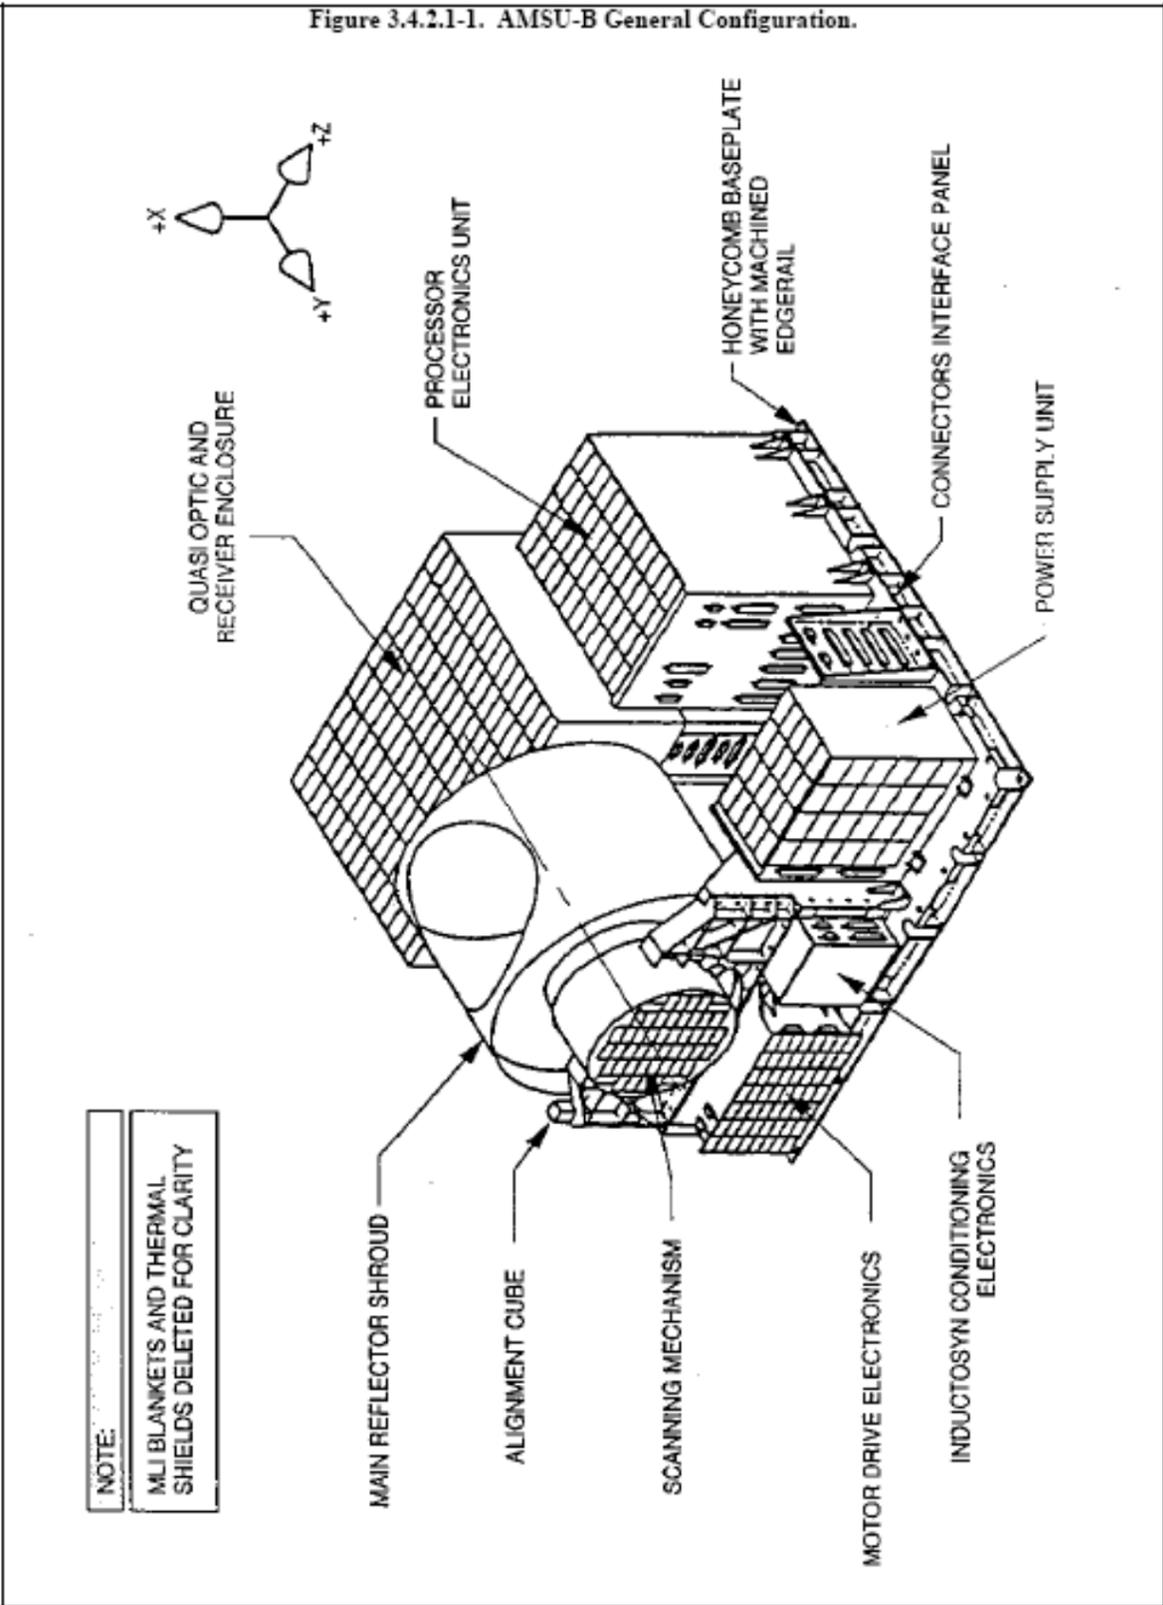

Figure 3.4.2.1-1. AMSU-B General Configuration

### 3.4.2.2 Microwave Receiver

The function of the Receiver Subsystem is to down-convert and detect the radiation from the Quasi-Optics to produce output voltages proportional to the detected RF power. The Receiver has three input channels and five output channels. Channel 16 uses a fundamental mixer with a center frequency of 89 GHz. Channel 17 uses a sub-harmonic mixer with a center frequency of 150 GHz. Channels 18, 19 and 20 are down-converted in one sub-harmonic mixer with a center frequency of 183.3 GHz. The IF output of the mixer is split and detected to produce the three channel outputs. The AMSU-B channel characteristics are shown in Figure 3.4.1-1. The receiver utilizes Gunn diode oscillators which are cavity stabilized and are of the reflection type. The diodes are Germanium mesa construction especially developed for AMSU frequencies. The temperatures of certain critical components of the Receiver Sub-system are sensed by AD590 temperature/current transducers for Analog Telemetry or by Platinum Resistance Thermistors (PRTs) for Digital Housekeeping Data.

### 3.4.2.3 Calibration Target

The radiometer is continually calibrated in flight with the aid of a cold reference view to space and a "warm" reference consisting of an ambient temperature Calibration Target. The "warm" reference is internal to the instrument. It consists of the following:

- microwave absorber providing quasi-blackbody radiation at microwave frequencies,
- a magnesium structured core,
- platinum resistance sensors to measure the temperature of the magnesium core accurately,
- an outer containment shroud of aluminum.

The Calibration Target presents a stable, high absorptivity, or quasi-blackbody load at approximately 290K (at nominal instrument temperature) into the instrument Main Reflector and is sized to fill the aperture in the Main Reflector/Shroud. The Calibration Target is viewed once during each scan of the instrument to provide a warm calibration reference. Gain is then computed from FOV counts taken at each of the two views and used to determine a radiance value for each channel. Apparent scene temperatures are finally calculated from the radiance values.

An integral shroud is fitted to match the main reflector/shroud, so that, as the Main Reflector is rotated, extraneous radiation impinging on the target is minimized.

Temperature control of the Calibration Target is passive and is designed to minimize temperature gradients within the target. Target temperature is sensed by seven Platinum Resistance Thermistors (PRTs) whose outputs are conditioned and digitized by the PEU and form part of the digital data telemetry.

### 3.4.2.4 Systems Requirements

A summary of the AMSU-B systems requirements is given in Table 3.4.2.4-1

**Table 3.4.2.4-1. AMSU-B Systems Requirements Summary.**

<b>Channel</b>	<b>16</b>	<b>17</b>	<b>18</b>	<b>19</b>	<b>20</b>

## 3.5 SPACE ENVIRONMENT MONITOR (SEM-2)

### 3.5.1 INSTRUMENT OPERATION

The SEM-2 Space Environment Monitor is a multichannel charged-particle spectrometer which senses the flux of charged particles at the satellite altitude, and thus contributes to knowledge of the solar-terrestrial environment. SEM-1 units have been in orbit on the TIROS-N series since 1978. SEM-2 is a new design produced by Panametrics, Inc. of Waltham, Massachusetts to specifications written by the Space Environment Center of NOAA.

Solar particle emissions travel to Earth in the form of the solar wind, which consists of streams of charged particles moving at hundreds of kilometers per second. It is a source of particles for the Earth's trapped radiation belts. In addition to the solar wind, there occur times of intense fluxes of energetic electrons, protons and alpha particles (energies up to 1,000 MeV). As a consequence of both the solar wind particle stream and the occurrences of very energetic particle emissions from the Sun, there can be large changes to the energy input to the magnetosphere, ionosphere and high altitude atmosphere. Some of this energy is deposited into the ionosphere to produce the aurora visible around both magnetic poles.

Large, abrupt changes occur in the solar wind. These changes produce changes in the magnetosphere and the ionosphere. This can result in hazards among which are:

1. Radiation hazard to people in space and the potential of increased radiation exposure to people in high flying aircraft;
2. Disruption of radio navigation;
3. Absorption, even blackout, of radio waves so that radio communication is disrupted;
4. Induced voltages and currents in electric power circuits leading to circuit breaker trip, damage to equipment, and failure of transformers;
5. Induced currents in buried pipe lines causing accelerated corrosion;
6. Change in density of the high altitude atmosphere causing change in drag on satellites;
7. Change in magnetic torque on satellites; and
8. Damage by electrons and protons to satellite circuits and solar panels.

For these reasons, SEM-2 is specified to sense particles over a broad range of energies. SEM-2 consists of two detectors: the total energy detector (TED) and the medium energy proton and electron detector (MEPED) along with a data processing unit (DPU).

#### 3.5.1.1 Total Energy Detector

The Total Energy Detector (TED) measures electron and proton energy fluxes in the 0.05 to 20 keV energy range.

Two independent measurements of the particle energy flux are made at zero and 30 degrees from the local vertical. The total energy measurement is divided into two ranges: 0.05 to 1 keV and 1 to 20 keV and each measurement is made independently for electrons and protons. The TED also

measures the maximum differential energy flux density and the energy at which it occurs for each direction and particle type (electron and proton).

TED operation is verified by a commandable In-Flight Calibration system to track changes in the TED electronics.

### 3.5.1.2 Medium Energy Proton Electron Detector

The Medium Energy Proton Electron Detector (MEPED) provides both directional and omni-directional measurements. The directional sensors, called telescopes, make independent measurements of the particle types in the energy intervals shown in Table 3.5.1.2-1. Directional measurements are made near the local vertical and near 90 degrees to the local vertical. The particle channels are designated by direction of view (0 or 9), particle type (E or P), and sequential energy range (1-6 for protons, 1-3 for electrons). Table 3.5.1.2-1 contains the particle types and energy intervals measured by the MEPED directional sensors.

<b>Table 3.5.1.2-1. Particle types and energy intervals measured by the MEPED directional sensors.</b>		
<b>Particle type</b>	<b>Channel Designations</b>	<b>Energy Interval (keV)</b>
Protons	0P1 and 9P1	30-80
	0P2 and 9P2	80-250
	0P3 and 9P3	250-800
	0P4 and 9P4	800-2500
	0P5 and 9P5	2500-6900
	0P6 and 9P6	>6900 integral
Electrons	0E1 and 9E1	>30 integral
	0E2 and 9E2	100 integral
	0E3 and 9E3	>300 integral

The omni-directional sensors measure proton energy in the following ranges: >16 MeV, >35 MeV, >70 MeV and >140 MeV. Each sensor consists of a dome of moderating material which absorbs energy from the particle (and so sets the detection energy threshold), a silicon solid state detector (SSD), a preamplifier, and a level comparator which responds to particles with enough energy to go through the moderator and produce a pulse from the detector large enough to exceed the level in the comparator.

The MEPED has an In-Flight Calibration (IFC) circuit started by command from the ground. Using pulses of increasing size, the calibration provides data for calculating the energy of each threshold and the noise (FWHM) of each directional channel.

### 3.5.1.3 Data Processing Unit

The Data Processing Unit (DPU) is the interface between the sensors and the spacecraft. It converts spacecraft power to the voltages required by the SEM-2. It counts pulses, scales them, combines some, and formats a data stream for Digital A telemetry. It digitizes analog monitors of TED, MEPED, and DPU circuits. Independent of whether SEM-2 power is on or off, some temperatures are monitored by the spacecraft.

The DPU provides bi-level monitors, via Digital B telemetry, of SEM-2 status. The DPU receives and processes commands from the ground through the spacecraft to operate SEM-2.

## 3.5.2 SYSTEM DESCRIPTION

### 3.5.2.1 Total Energy Detector

The Total Energy Detector (TED) consists of eight Electrostatic Analyzers (ESA), pulse height discriminators (PHD), an In-Flight Calibrator (IFC), two high voltage (HV) supplies, a sweep voltage supply and housekeeping circuits.

The ESA selects particles according to their charge and energy using curved plates which apply an electric field to the particles as they pass through the ESA. Only particles of the selected charge and energy can pass entirely through the ESA. At the outlet of the ESA is a continuous dynode electron multiplier (CDEM). The CDEM produces a pulse for each particle passed by the ESA.

The voltage applied to the ESA curved plates steps up through a series of exponential values to allow particles of increasing energy to pass through. Timing by the DPU determines the energy counter in which the CDEM pulses are accumulated.

There are commandable HV supplies for the electron CDEMs (up to 3,700 V) and for the proton CDEMs (up to 2,700 V) that compensate for gain degradation of the CDEMs with use.

### 3.5.2.2 Medium Energy Proton Electron Detector (MEPED)

The MEPED consists of two proton telescopes, (each containing two solid state detectors (SSDs)), two electron telescopes (each containing a single solid state detector) and four Omni-directional sensors (each containing a single solid state detector), Charge Sensitive Preamplifiers, Analog Signal Processors, Proton and Electron Coincidence Logic, In-Flight Calibrator, Low Voltage Regulators, SSD Bias Supply and Analog Housekeeping.

The two proton telescope sensors are located at 0 and near 90 degrees to the local vertical. Each sensor has logic circuits which select six energy ranges from 30 keV to greater than 6900 keV. The energy intervals detected are shown in Table 3.5.2.2-1.

<b>Table 3.5.2.2-1. Proton telescope detection energy levels.</b>	
<b>Energy Interval Designation</b>	<b>Ep Range (keV)</b>
0P1 and 9P1	30-80
0P2 and 9P2	80-250
0P3 and 9P3	250-800
0P4 and 9P4	800-2500
0P5 and 9P5	2500-6900
0P6 and 9P6	>6900

The two electron telescopes sensors are located at 0 and near 90 degrees to the local vertical. Each sensor has logic circuits which select three energy thresholds from 30 keV to 300 keV. Each energy channel has a veto for particle energy deposits of >2500 keV, which reduces the contamination from high energy proton fluxes. The energy intervals are shown in Table 3.5.2.2-2.

<b>Table 3.5.2.2-2. Electron telescope detection energy intervals.</b>	
<b>Energy Interval Designation</b>	<b>Ep Range (keV)</b>
0E1 and 9E1	>30
0E2 and 9E2	>100
0E3 and 9E3	>300

The four Omni-directional Proton Sensors, D4, D5, D6 and D7 have energy thresholds at 16, 35, 70 and 140 MeV, respectively.

A charged particle enters a SSD where it releases charges from the crystal until its energy is gone or it exits the crystal. The amount of charge released is proportional to the energy deposited in the crystal. The charge is collected by a charge sensitive preamplifier which converts the charge to a voltage pulse. After passing through an analog signal processor circuit, which shapes the pulse by pole-zero cancellation, single differentiation, double integration and baseline restoration, coincidence logic separates the pulses into the various channels for counting by the DPU.

Regulated voltage for the SSDs is provided by an SSD bias supply. An in-flight calibrator (IFC) puts pulses into the charge sensitive preamplifier inputs to check the complete analog signal processor and coincidence logic circuitry. The IFC data are telemetered the same as the normal particle data. Thresholds and noise values are calculated on the ground.

### 3.5.2.3 Data Processing Unit

The Data Processing Unit (DPU) is the sole electrical interface between the detectors and the spacecraft except for the TED and MEPED heaters. It converts spacecraft power to the voltages required by the SEM. It counts pulses, scales the counts, combines some, and formats a data stream for Digital A. It digitizes analog monitors of TED, MEPED and DPU voltages and temperatures. Independent of whether SEM-2 power is on or off, some temperatures are monitored by the spacecraft. The DPU provides bi-level monitors via Digital B of SEM-2 status. The DPU receives and processes commands from the ground through the spacecraft to control SEM-2.

- Converts +28 V Main Bus power to SEM-2 voltages;
- Receives commands from the spacecraft and controls the TED and MEPED accordingly;
- Counts high speed pulse data from the MEPED and TED;
- Provides Digital A, Digital B bi-level and spacecraft analog output to the spacecraft telemetry;
- Controls the In-Flight Calibration.

The DPU contains four "active" Printed Circuit Boards (daughter boards) and one "passive" PCB (mother board). The DC/DC converter is contained in a Faraday cage to reduce radio frequency interference (RFI) which might be caused by "high power" switching. SEM-2 operation is controlled by two redundant microprocessors, one of which is selected by ground command to be active.

#### 3.5.2.3.1 Telemetry

Within the DPU three types of telemetry are generated: Digital A, Digital B and Analog.

#### 3.5.2.3.2 Digital A

Digital A contains most of the telemetered data and consists of two 8-bit serial words made available to the spacecraft every 0.1 second, i.e., every minor frame.

#### 3.5.2.3.3 Digital B

Digital B (DIGB) consists of 9 bits always available to the spacecraft. DIGB is updated by the DPU each 2.0 seconds. The spacecraft samples these each 3.2 seconds.

#### 3.5.2.3.4 Spacecraft Analog Telemetry

A third type of data, analog telemetry, goes to the spacecraft. In this type, thirteen analog monitors are provided. Nine of these monitors verify command execution and indicate general state of health. These nine are also digitized and included in Digital A. The remaining four are temperature monitors powered by the +28 V Analog Telemetry Bus, which allows the DPU, MEPED and TED housing temperatures, as well as one MEPED proton telescope temperature, to

be monitored regardless of whether the instrument is on or off. These temperature monitors are not digitized by the DPU, but are processed directly by the TIP.

#### 3.5.2.3.5 Timing

All timing is controlled by the microprocessor and is synchronous with the spacecraft 1.248 MHZ clock. Various data acquisition timing signals are spawned from a single timing chain to ensure proper signal phase. DPU timing has the following parts:

- Data acquisition Timing for TED and the MEPED
- Digital A Timing
- Microprocessor and Data Bus Timing
- Watchdog Timing

### 3.5.3 CALIBRATION REQUIREMENTS

The SEM-2 provides an In-Flight Calibration (IFC) for the MEPED and TED.

## 3.6 DATA COLLECTION SYSTEM/2 (DCS/2)

The Data Collection System (DCS), also known as ARGOS, DCS, collects data from platform transmitters located on continents and oceans in UHF frequency. The ARGOS program is administered under a joint agreement between NOAA and the French space agency, Centre National d'Etudes Spatiale (CNES). The system consists of in-situ data collection platforms equipped with sensors and transmitters and the ARGOS instrument (DCS) aboard the NOAA KLM and NOAA-N,-N' satellites. The global environmental data sets are collected at telemetry ground stations in Fairbanks, Alaska; and Wallops Island, Virginia; and pre-processed by NOAA/NESDIS in Suitland, Maryland. Two CNES subsidiary companies, Collecte Localisation Satellites (CLS) in Toulouse, France and Service ARGOS in Largo, Maryland process the data and deliver it to the end user.

Flying the ARGOS system aboard NOAA polar-orbiting satellites provides worldwide coverage. Additionally, incorporating the ARGOS instrument on a moving satellite allows for locating an in-situ platform using Doppler shift calculations. This positioning capability permits applications such as monitoring drifting ocean buoys and studying wildlife migration paths. ARGOS can track platforms anywhere in the world, supplying positions to users around the globe. Platforms can be attached to practically any type of physical object, for example: an ocean buoy, a stream gauge, a bear, a bird, or a fishing vessel.

ARGOS platforms are located by using the Doppler Effect, which gives an accuracy of up to 150 meters. Doppler locations are good for compact, low-power transmitters and in difficult radio environments. The satellites receive the signals sent even in extreme conditions such as a platform transmitting from a dense rainforest or from transmitters on the polar ice caps.

The ARGOS system is comprised of:

A set of user platforms, fixed or mobile, deployed at sea, on land or in the air and transmitting independently. The platform is the carrier complete with its sensors and ARGOS Platform Transmitter Terminal (PTT) or Platform Messaging Transceiver (PMT),

- A desired complement of two operational NOAA spacecraft and two in backup in simultaneous orbit, with instrument packages that receive PTT/PMT messages on a random access basis, then separate, time-code, format and retransmit the data to ground stations,
- The ground stations and two Global Processing Centers (GPCs) in Toulouse, France and Landover, Maryland, where data are retrieved, processed, and distributed to users. Each center can take on the full operational workload if the other fails. CLS also operates Master Beacons in Fairbanks (Alaska), Svalbard (Norway), and Toulouse (France) to provide two way messaging from the A-DCS instrument.

Section 3.6.1 describes the DCS/2 instrument flown onboard the NOAA KLM and NOAA-N satellites and Section 3.6.2 provides details on the Advanced Data Collection System (A-DCS) instrument flown on the NOAA-N' spacecraft.

### 3.6.1 DATA COLLECTION SYSTEM/2 (DCS/2)

#### 3.6.1.1 Instrument Operation

The Data Collection System/2 (DCS/2) is one of the environmental monitoring systems flown on the NOAA KLM and NOAA-N spacecraft. The DCS/2 assists NOAA in its overall environmental mission and in support of the Global Atmospheric Research Program (GARP). It has approximately 2000 environmental platforms located around the Earth to measure such environmental factors as temperature, pressure, and currents. Some of these platforms are immersed in a moving fluid, such as the ocean and the atmosphere. These moving platforms, buoys and balloons, provide additional environmental information on velocity and direction of the ocean and wind currents.

The DCS/2 receives information from these fixed and moving environmental platforms and processes and transfers the data for storage by the spacecraft tape recorders. These stored data are transmitted to a NOAA ground station during station contact. The ground station records and transmits the DCS/2 data to CNES and to Service ARGOS in Landover, Maryland. CNES is the responsible manufacturing, system engineering and data distribution agency for the DCS/2.

#### 3.6.1.2 System Description

The DCS/2 is comprised of three units: the Receiving and Power Unit (RPU) and two Signal Processor Units (SPU-A and SPU-B). The platforms transmit data to the DCS/2 at a carrier frequency of 401.650 MHz, digital biphase format at 400 bps. The DCS/2 demodulates this signal and determines the carrier frequency and relative time of each transmission. This data is processed, formatted, and transferred to the TIROS Information Processor (TIP). The following paragraphs describe how the processing occurs in each of the DCS/2 units.

##### 3.6.1.2.1 Receiver Power Unit

The receiver linearly converts the incoming signal by means of two translations to an intermediate frequency which is applied to the input of the search unit and to the Data Recovery

Units (DRUs). The search unit is basically a spectrum analyzer which uses a Fast Fourier Transform to cover the 80 kHz operating frequency range.

#### 3.6.1.2.2 Control Unit

The control unit sequentially scans the eight search unit channels. It makes a binary estimate of both the signal level and frequency. These two digital words are stored in the CU and are used for the assignment of a DRU to a particular receiver output signal.

#### 3.6.1.2.3 Data Recovery Unit

The DRU is comprised of three sections: (1) phase-lock loop, (2) bit synchronizer, and (3) Doppler counter and formatter. The eight DRUs perform the following signal functions: acquisition of the carrier, signal demodulation, bit synchronization, frame synchronization, Doppler counting, decommutation and formatting of the data.

#### 3.6.1.2.4 Telemetry Encoder and Memory

The telemetry formatter interrogates the buffer in the DRUs. When the buffer is full, the encoder sends a command to shift the 24 bits into memory. When the data transfer signal from the TIP is received by the encoder, it will transfer the data out of memory to the TIP.

#### 3.6.1.2.5 Power and Command Unit

Power for the DCS/2 is supplied by the spacecraft +28 V main power bus. This voltage is converted by the power unit to four levels; +5.0, +12, -12, and -15 V. Regulation and current limitation is provided for each of these DCS buses. The command unit consists of seven relays which perform the ON/OFF functions for the DCS/2. The Control Interface Unit (CIU) sends pulse commands which control these relays. The command unit sends back to the TIP 14 status bits and six analogs.

#### 3.6.1.2.6 Calibration Requirements

The DCS/2 has no on-orbit calibration requirements.

### 3.6.2 ADVANCED DATA COLLECTION SYSTEM (A-DCS)

#### 3.6.2.1 General

NOAA-N' contains an Advanced Data Collection System (A-DCS) instrument. Platforms (buoys, free-floating balloons and remote weather stations) collect relevant data and transmit them to the spacecraft via a PTT and Platform Messaging Transceiver (PMT) in UHF frequency.

A-DCS uses Doppler information to enable the location of PTTs. The data are stored onboard the satellite for later transmission to the ground. A-DCS also includes a transmitter function to send stored messages to the PMTs, which have been uplinked via the Master Beacon.

#### 3.6.2.2 Scientific Objectives

The Argos A-DCS is a space-based, data telemetry system that provides a global means to locate and collect environmental data from fixed and moving, low-power transmitters; i.e., polar ice flows, ocean buoys, birds, mammals, etc. in near-real time (15 minutes to 3 hours). The Argos A-DCS transmits data for operational and research related environmental applications, e.g., meteorology, oceanography and protection of the environment, with the majority of users being government/non-profit agencies and researchers. Argos A-DCS customers are engaged in over 1,000 programs operating approximately 15,000 data collection platforms in 72 countries.

#### 3.6.2.3 Functional Description

The environmental platforms transmit data to the A-DCS at a carrier frequency around 401.635 MHz, digital modulation format at 400 bps and a high data rate of 4800 bps. The A-DCS demodulates this signal and determines the carrier frequency and relative time of each transmission. This data is processed, formatted, and transferred directly to the ground and to the satellite for real-time or later transmission to the ground.

#### 3.6.2.4 Receiver Processing Unit

The receiver linearly converts the incoming signal to an intermediate frequency that is applied to the input of the search unit and to the equivalent of Data Recovery Units (DRUs). The search unit is basically a spectrum analyzer, which uses a Fast Fourier Transform to cover the 110 kHz operating frequency range. The receiver has a center frequency of 401.635 MHz and antenna polarization of RHCP.

#### 3.6.2.5 Control Unit

The control unit sequentially scans the search unit channels. It makes a binary estimate of both the signal level and frequency. These two digital words are stored in the Control Unit and are used for the assignment of a DRU to a particular receiver output signal.

#### 3.6.2.6 Data Recovery Unit

Processing software performs the following signal functions: acquisition of the carrier, signal demodulation, bit synchronization, frame synchronization, Doppler counting, decommutation; and management software performs the formatting of the data.

### 3.6.2.7 Telemetry Encoder and Memory

The telemetry formatter interrogates the buffer in the equivalent DRUs. When the buffer is full, the encoder sends a command to shift the bits into memory. When the data transfer signal from the satellite is received by the encoder, it transfers the data out of the memory to the satellite.

### 3.6.2.8 Transceiver

The A-DCS instrument sends messages to the user's mobile terminals through its UHF transmitter (465.9875 MHz bi-phase PM 200 or 400 bps). The user requests are received at the Toulouse, France facilities of CLS, the CNES subsidiary in charge of the operations of the ARGOS system. These requests will indicate the identification of the destination terminal, the message to be transmitted at 400 bps (or 200 bps) and the time constraints (if any).

Taking into account the above and the status of the ARGOS system, the Downlink Message Management Center (DMMC) will prepare the uploading of the request to the instrument through one of the Master Beacons of the ARGOS system.

The best situated Master Beacon is selected by the DMMC and the message to be uplinked is sent to this Master Beacon through a terrestrial public network. This uplink message contains the information necessary to prepare the downlink message to be sent to the user terminal.

The uplink message is an ARGOS message, the content of which is analyzed upon reception by the instrument which in turn prepares the downlink message to be included in the downlink High-level Data Link Control bit stream transmitted by the UHF transmitter.

## **3.7 SEARCH AND RESCUE SATELLITE (SARSAT) INSTRUMENT PACKAGE**

General aviation aircraft are required to carry Emergency Locator Transmitters (ELTs), which are triggered by the impact of a crash and broadcast a signal at 121.5 and 243 MHz. These transmissions can be heard as siren like sounds on receivers of aircraft which may be flying over the transmitter. In addition, certain large ships are also required to carry 121.5 MHz Emergency Position Indicating Radio Beacons (EPIRBs) which also transmit the siren like sound. Some ocean going vessels voluntarily carry the EPIRBs.

It has been recognized for many years that receipt of ground transmissions by overflying satellites includes a Doppler shift of the transmitted frequency due to the velocity of the satellite relative to the transmitter. This Doppler shift information can be used to locate the transmitter. The Search and Rescue (SAR) Instrument Package first flown on NOAA-E and subsequent NOAA satellites carries a repeater for receiving and rebroadcasting the 121.5 and 243 MHz signals to a ground station where they can be detected and located by measuring their Doppler shift. However, these ELTs and EPIRBs were conceived prior to the satellite system and lack specifications which assure reliable detection through the satellite. Even so, by the launch of

NOAA-H, over 1,000 people had been saved by SAR forces making use of satellite-derived alerts and locations.

A 406 MHz SAR system has been designed specifically to work with the satellites. The NOAA satellite SAR Instrument Package carries a 406 MHz processor which receives transmissions from 406 MHz ELTs and EPIRBs, recovers their digital message, measures the Doppler shift, and both stores the data for later transmission and also transmits it in real time. A receiver for the 406 MHz band is also included in the repeater. This new system utilizes distress transmitters (ELTs and EPIRBs) designed to be compatible with the satellite and the system provides full global coverage. The 406 MHz system was demonstrated, evaluated and declared ready for operational use by the time of the NOAA-H launch. Beginning with NOAA-H, the 406 MHz processor began utilizing a solid state memory for storage of the global data. Prior to NOAA-H, the processors used the spacecraft tape recorder for global storage.

The NOAA KLM satellites carry an improved 406 MHz processor, designated SARP-2. This unit has improved performance in system capacity, bandwidth, and protection against interference.

### 3.7.1 INSTRUMENT OPERATION

The SARSAT Instrument Package for the NOAA-K spacecraft consists of antennas/ diplexer/ filters, a search and rescue repeater (SARR) and a search and rescue processor (SARP-2) as shown in Figure 3.7-1.

- SARSAT Antennas
  - SRA receive antennas
    - 121.5/243 MHz
    - 406 MHz
  - UDA receive antenna
    - 401.65/406.050 MHz
  - SLA transmitter antenna
    - 1544.5 MHz
- SARR
- SARP-2

The SARR operates as a "bent-pipe" repeater for the 121.5 MHz, 243 MHz, and 406.05 MHz bands and relays these transmissions from the ground-based emergency transmitters to Local User Terminals (LUTs) in real time. The SARR also transmits the SARP-2 digital data stream. The 406.05 MHz band of the SARR is for test and interference monitoring purposes, the normal processing is performed by the SARP-2.

After frequency translation, the base band spectra of the three signals phase modulate a 1544.5 MHz L-band transmitter for data relay to the ground. This technique maintains the Doppler information contained in the received signal from the three repeated bands. By processing the Doppler information at the LUT, the location of the emergency transmitter can be determined.

SARP-2 406.05-MHz signal data are both relayed in real time to the LUTs (if in sight) and stored for later transmission over a LUT when it comes in view of the satellite. SARP-2 signals are received on the Ultra High Frequency (UHF) Data Collection System Antenna (UDA), which the SARP-2 shares with the DCS-2. A frequency diplexer is used to separate the SARP-2 signals from DCS-2 signals. The SARP-2 measures the frequency and level of the incoming signal. In its data stream are a time tag, frequency and level information, a synchronization code indicating the start of each received message and the original message contained in the incoming signal. The data are stored in the SARP-2 last-in-and first-out circular memory, which continuously transmits its contents via the SARR L-band link at 2.4 kbps. When the memory is full, new data overwrites the oldest message. The memory readout pauses at the conclusion of a message block to allow transmission of new data and then continues its cyclic transmission with the new message, having erased and replaced the oldest message.

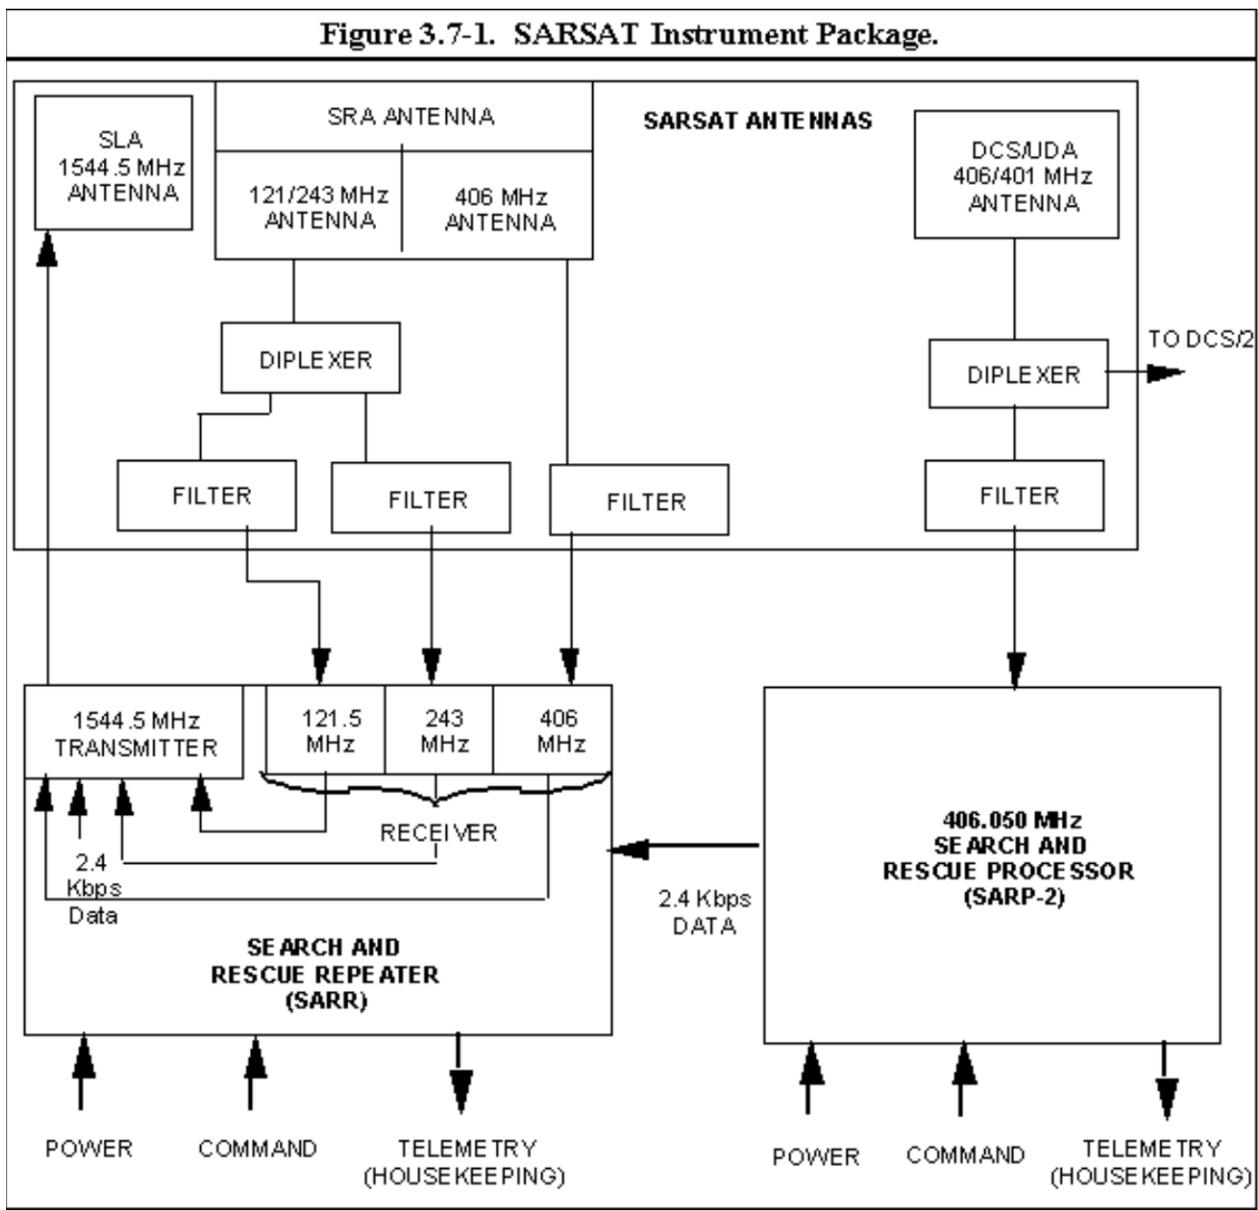

The SARP-2 and SARR data are received by the CDA stations via either the HRPT downlink or the TIP beacons.

The SARP-2, which is flown on NOAA KLM, provides the stored data interleaved with the real-time data in the 2.4 kbps data stream sent through the 1544.5 MHz downlink transmitter. The output of the SARR Instrument Package is four frequency multiplexed signals on the 1544.5 MHz downlink transmitter.

- (a) 2.4 kbps data
- (b) 121.5 MHz band translated
- (c) 243 MHz band translated
- (d) 406 MHz band translated

The SARR instrument outputs SARP-2 data and data stored in the SARP memory. The SARP-2 2.4 kbps data output consists of a Doppler frequency measurement (appropriately time-tagged) which includes the SAR data message from the ELT/EPIRB.

For the regional coverage mode, 2.4 kbps real-time data are transmitted to a Local User Terminal (LUT) via the SAR Repeater downlink. Global area coverage is provided by storing global 2.4 kbps data in a 406 Processor memory; these data are also transmitted to a LUT via the SAR Repeater downlink, but only during times when there is no regional coverage 2.4 kbps data to be transmitted.

### 3.7.2 SYSTEM DESCRIPTION

The orbiting SARSAT Instrument Package receives signals from ground-based ELTs/EPIRBs and returns them to both raw form and preprocessed form (406 MHz Experimental Units only) to one or more ground stations. Table 3.7-1 shows the SARSAT Subsystem Characteristics, while Figure 3.7-1 shows the SARSAT Instrument Package which consist of three elements:

- (a) SARSAT Antennas;
- (b) SAR Repeater (SARR) and
- (c) SAR Processor (SARP-2).

### 3.7.2.1 SARSAT Antennas

The antenna subsystem consists of the:

- (a) SAR Receiver Antenna (SRA);
- (b) Data Collection System Ultra High Frequency (UHF) Antenna referred to as DCS/UDA and
- (c) SAR L-Band Transmitter Antenna (SLA).

#### 3.7.2.1.1 SARSAT Receiver Antennas

The SRA feeding the SARR consists of two coaxial Quadrifilar designs. The outer quadrifilar operates at two frequencies: 121.5 MHz and 243.0 MHz. The inner quadrifilar operates at 406.05 MHz. The DCS/UDA is a quadrifilar design and operates at 406.050 MHz for SARP-2 and also 401.650 MHz for the Data Collection System/2 (which is not part of the SARSAT instrument package).

The Search and Rescue Receiver antennas are mounted on a boom which is deployed clear of the other spacecraft instruments, antennas and solar array. There are four receive antenna ports for the SARSAT instruments: three for the SARR, and one for the SARP-2.

The 243 MHz and 406 MHz for both SRA and UDA receiving antenna patterns are shaped partially to compensate for increased signal path losses for ELTs at increasing distances from the subsatellite point.

#### 3.7.2.1.2 L-Band Transmitter Antenna

The L-Band transmitter antenna is a small 1544.5 MHz quadrifilar helix located on the Earth-facing side of the spacecraft which has a single lobe pattern for full Earth coverage. There is one transmit antenna port for connection to the SLA of the SARR.

### 3.7.2.2 SAR Repeater (SARR)

As shown in Figure 3.7-1, the SARR subsystem receives the ELT/EPIRB signals on 121.5, 243.0, and 406.05 MHz, down converts to selected intermediate frequencies, remodulates this data, and retransmits on 1544.5 MHz (repeater data mode). The baseline concept is that each receiver is a dual conversion unit with automatic gain control (AGC) which converts the received bandwidth down to a frequency range between 35 kHz and 210 kHz. These bands are then summed with 2.4 k-bit data from the SAR 406 MHz processor and phase modulated on the 1544.5 MHz downlink carrier frequency. The modulation level of each band is independently adjustable to account for any long-term changes either in the operational procedure or the system noise environment.

Each channel includes a commandable attenuator that allows the modulation index to be varied independently, subject to the constraint that the composite rms modulation index shall not exceed 0.74 radians.

The 2.4 kHz channel is controllable in 5 dB steps, whereas the 121.5, 243 and 406 MHz channels are controllable in 1 dB steps.

### 3.7.2.3 SAR Processor (SARP-2)

The 406.050 MHz on-board processor (see Figure 3.7.2.3-1) receives the 406 MHz transmissions from distress beacons and translates to an Intermediate Frequency (IF) using a double conversion. The IF signal is demodulated in a phase-lock loop to recover the data; the carrier frequency is measured and the data time tagged. For the regional coverage mode, real-time data are transmitted to a LUT via the SARR downlink. Global area coverage is provided by storing global data in a 406 Processor memory; these data are also transmitted to a LUT via the SARR downlink, but only during times when there is no regional coverage data to be transmitted.

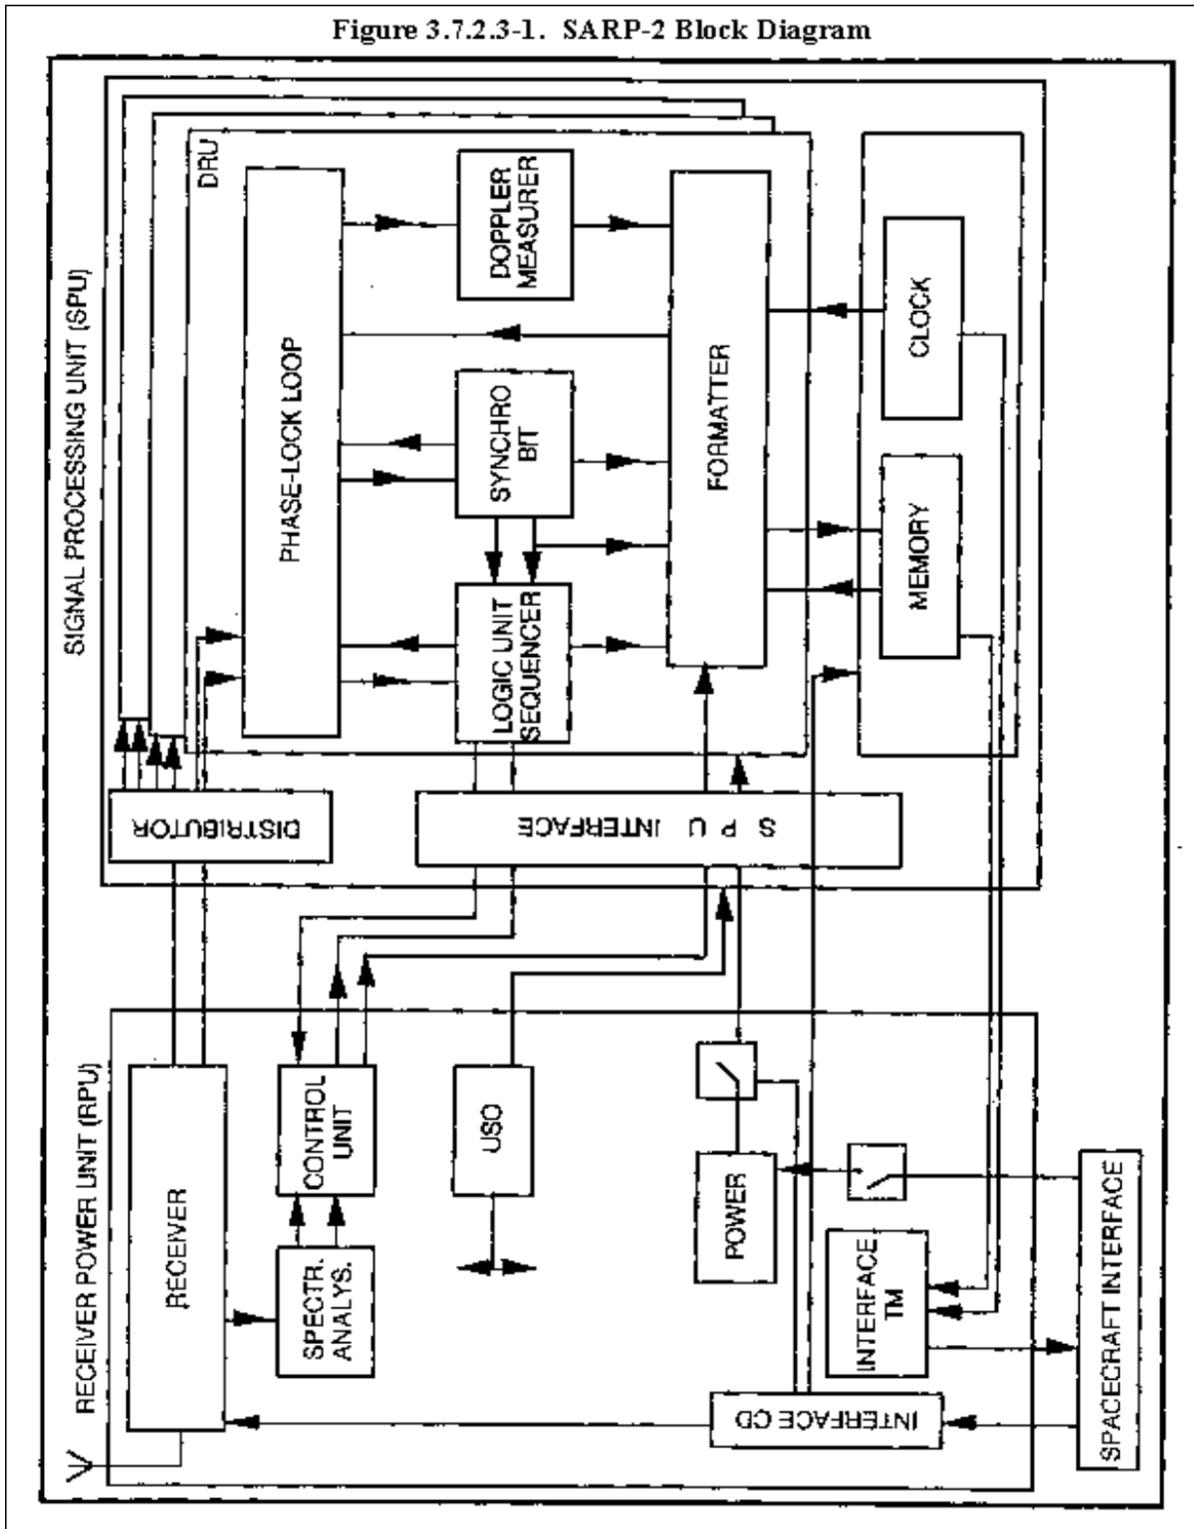

The received signal is fed first to the receiver power unit (RPU) which utilizes a double conversion process to translate the signal to a lower frequency. The receiver is a constant gain type, linear over a 23 dB dynamic range.

The signal processing unit (SPU) is a Fast-Fourier Transform which searches the full 80 kHz bandwidth. When a signal is detected, the control unit assigns the signal to a Data Recovery Unit (DRU) on the basis of an algorithm designed to optimize the multiple-access performance. The algorithm for assignment is based on the frequency and level of input to the receiver as well as the current assignment state of the DRUs.

When a signal is assigned to a DRU, the voltage controlled oscillator (VCO) is pre-steered to within the lock-in range by a voltage which is proportional to the signal frequency as determined by the search unit. After VCO lock-up, the signal is demodulated and fed to a bit synchronizer which supplies the clock for subsequent digital processing. When the clock is available, the sync word contained in the message is detected and the remaining digital message processed. Doppler frequency is determined by counting the VCO signal for a specified time base referenced to the processor ultra stable oscillator (USO).

The processor formatter outputs a composite message made up of eight 24-bit words. Messages are organized into either long or short messages depending on the total number of data bits to be transmitted. The expected message length is determined by the processor by detecting a single bit flag indicating message length contained in the received message from the experimental ELT/EPIRB. The formatted message output is sent to the main memory and to the interface unit where it is transferred to the SARR 2.4 kbps input port. The processor is implemented physically into two units with a total weight of 24.5 kg, and a total volume of 37 liters. Power consumption is 19.9 Watts.

Figure 3.7.2.3-1. SARP-2 Block Diagram

### 3.7.3 CALIBRATION REQUIREMENTS

The SARR and SARP-2 have no on-orbit calibration requirements.

## 3.8 SOLAR BACKSCATTER ULTRAVIOLET SPECTRAL RADIOMETER (SBUV/2)

### 3.8.1 INSTRUMENT OPERATION

#### 3.8.1.1 Purpose of the SBUV Instrument

The purpose of the SBUV instrument is to measure the solar irradiance and Earth radiance in the near ultraviolet spectrum. From these data, the following atmospheric properties can be deduced:

1. The global and vertical distribution of stratospheric ozone
2. The structure and dynamics of stratospheric ozone
3. Photochemical processes and the influence of "trace" constituents on the ozone layer.
4. Long-term solar activity in the Ultraviolet spectrum.

Usable data can only be collected by the SBUV when it is integrated onto an afternoon spacecraft due to solar angle requirements.

#### 3.8.1.2 Instrument Description

Two optical radiometers form the heart of the SBUV instrument: a monochromator and a small but very important Cloud Cover Radiometer (CCR). The instrument contains four mechanisms: a movable grating for wavelength selection in the monochromator, a deployable diffuser which selects solar or Earth radiation measurements, a deployable Mercury lamp for wavelength calibration and an optical chopper mechanism which converts the steady incoming radiation to pulses of UV light which can be readily processed by the SBUV detectors and electronics.

The optical detectors consist of a photo multiplier tube (PMT) in the monochromator and a vacuum photo diode (VPD) in the CCR. The PMT operates from a high voltage supply of about -700 volts DC; the VPD in the CCR operates from a bias of about -10 volts derived from the instrument's low voltage power supply (LVPS).

### 3.8.2 SYSTEM DESCRIPTION

The SBUV/2 is a nadir pointing no spatial scanning instrument sensitive to radiation in the 160 nm to 400 nm ultraviolet spectrum. The overall radiometric resolution is approximately 1 nm in this spectral band.

The SBUV instrument optical hardware and main electronics are carried in two modules. The Sensor Module (SM) contains the optical elements and detectors while the Electronics Module (ELM) houses the main electronics and power supplies.

The use of a deployable diffuser in the SM gives the instrument the versatility of selecting between Solar and Earth measurements. With the diffuser "stowed", the instrument views the Earth directly. The data from this configuration corresponds to Earth radiance. With the diffuser deployed into the "Sun" position, the detector output measurements correspond to solar irradiation data. Ground and in flight calibration data are used to convert the detector data and diffuser mode data to solar irradiation or Earth Radiance units.

The SM houses the monochromator optical hardware which uses a movable grating to select the wavelength where measurements are made. The grating mechanism can be commanded to any one of 8,192 positions giving the monochromator approximately 0.1 nm wavelength resolution. Commands which correspond to grating positions come from a Read Only Memory (ROM). Data read from the ROM correspond to 12 discrete wavelength positions in the "DISCRETE" mode. In the "SWEEP" mode, the ROM data is simply a grating position corresponding to the wavelength where the sweep will start.

The PMT has a very large dynamic range (greater than 120 dB). This range is transmitted in three ranges requiring a total of 0.75 seconds for stepping and settling of the grating to a new position and 1.25 seconds of integration time before transmission, when the instrument is in this "discrete" grating mode.

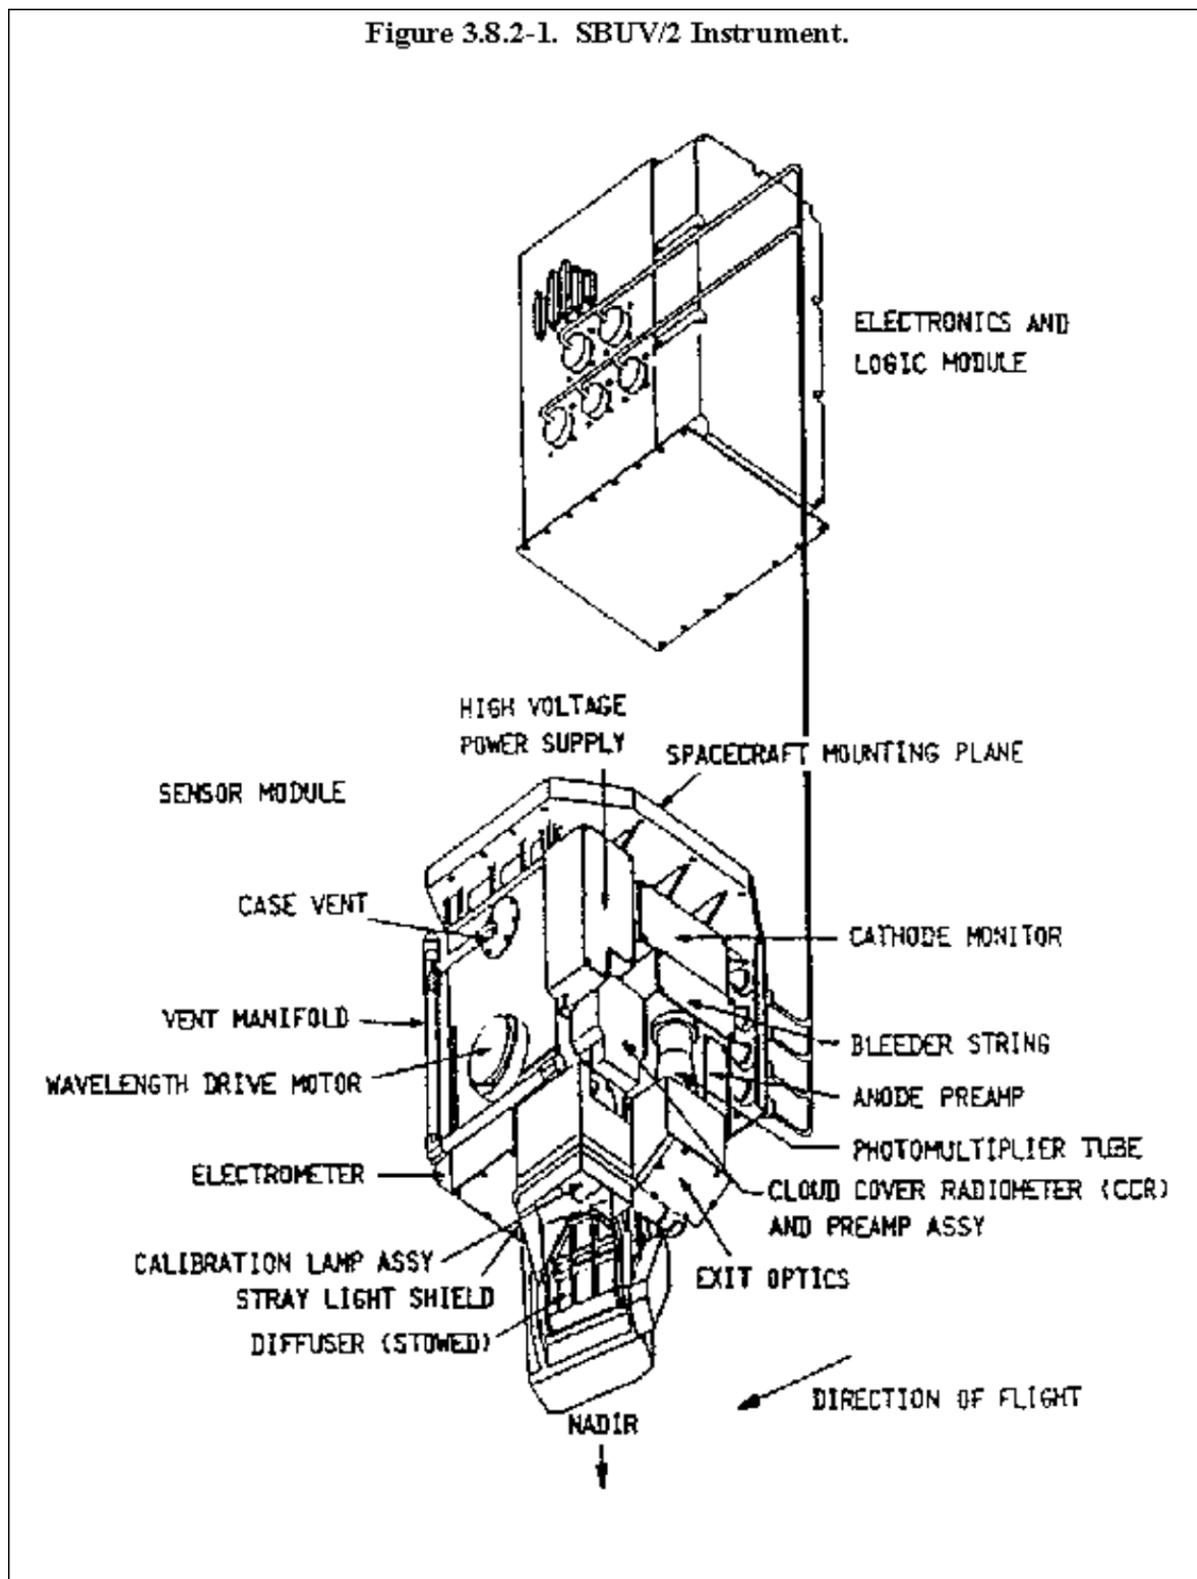

In the "sweep" mode, the grating is stepped every 50 ms and the PMT signal is integrated (while the stepping continues) for 100 ms before transmission.

The CCR has a fixed 379 nm filter for wavelength selection and is co-aligned to the monochromator; therefore, it views the same scene as the monochromator. The output of the CCR represents the amount of cloud cover in a scene, as the name implies, and is used to remove the effects of clouds in the monochromator data. CCR data is transmitted once per second in both discrete and sweep modes.

The ELM houses the low voltage power supplies and the electrical (Command and Data) interface to and from the spacecraft.

The SBUV/2 mechanical configuration is shown in Figure 3.8.2-1.

Figure 3.8.2-1. SBUV/2 Instrument.

### 3.8.3 CALIBRATION REQUIREMENTS

#### 3.8.3.1 In-Flight Measurement of Detector Gain

The SBUV/2 provides in-flight measurement of changes in gain of the detector(s), including the preamplifier stage. The measurements are sensitive enough to determine a gain change of 0.5% or less in the spectral range 300 to 340 nm. Averaging 100 measurements is permissible.

#### 3.8.3.2 In-Flight Wavelength Calibration

The SBUV/2 provides the means of in-flight wavelength calibration. The onboard calibration is sensitive enough to detect 0.1 nm shift in the indicated wavelength with a measurement precision of 0.01 nm.

#### 3.8.3.3 Pre-flight Calibration: Ratio of Radiance to Irradiance Accuracy

The ratio of the radiance calibration to irradiance calibration at the same wavelength is determined to an accuracy of 2.35% in the spectral range 200 nm to 250 nm and to an accuracy of 1.53% at 250 nm; 1.57% at 300 nm and 1.82% in the spectral range 340 nm to 400 nm. The ratio is determined from radiance and irradiance measurements made with a minimum time separation; i.e., at each Discrete Mode wavelength, the spectral drive is stopped and both measurements made before continuing. During the time of ratio measurement, the instrument

The ratio of the radiance calibration to irradiance calibration at the same wavelength is determined to an accuracy of 2.35% in the spectral range 200 nm to 250 nm and to an accuracy of 1.53% at 250 nm; 1.57% at 300 nm and 1.82% in the spectral range 340 nm to 400 nm. The ratio is determined from radiance and irradiance measurements made with a minimum time separation; i.e., at each Discrete Mode wavelength, the spectral drive is stopped and both measurements made before continuing. During the time of ratio measurement, the response does not vary by more than 0.5%.

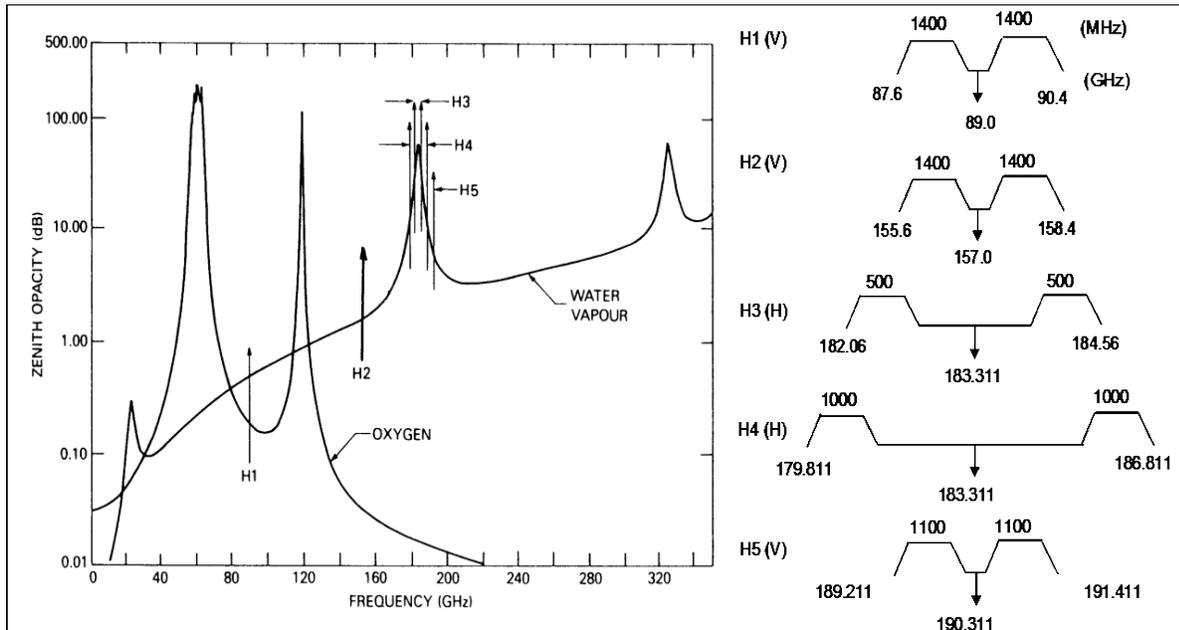

## 3.9 MICROWAVE HUMIDITY SOUNDER (MHS)

### 3.9.1 INSTRUMENT OPERATION

The Microwave Humidity Sounder (MHS) is a self-calibrating microwave radiometer, observing the Earth with a field of view of  $\pm 50^\circ$  across nadir, in five frequency channels of the millimeter-wave band (89-190 GHz). MHS, together with the complementary AMSU-A instruments, provides the operational microwave sounding capability for the NOAA-N, -N' meteorological satellites.

Channels at 157 GHz and around the 183 GHz water vapor absorption line provide a humidity profile sounding capability, while the 89 GHz channel provides information on surface temperature and emissivity (in conjunction with AMSU-A channels) and detects cloud and

**Figure 3.9.1-1. MHS Channels and Passband Arrangement**

precipitation contaminated pixels. The MHS instrument represents an improvement to the AMSU-B radiometer on board previous NOAA satellites, while providing continuity to its data. Two MHS instruments are planned to fly on NOAA-N and -N' satellites, and three on the METOP satellite series of the European Polar System (EPS). MHS is a cross-track, line-scanned instrument. Ninety contiguous scene resolution cells are sampled in a continuous scan, covering 50 degrees on each side of the sub-satellite path, with an antenna beam width of 1.11 degrees at half power point. These scan patterns and geometric resolution translate to a 17-km diameter cell at nadir from the 870 km nominal orbital altitude.

A parabolic mirror is rotated to sample the Earth scene at 90 equidistant angular positions, at a rate of three scans every eight seconds, and at the same time to provide reference measurements against two calibration sources, i.e. an on-board blackbody target and a view on free space. The radiation is then conveyed on four feeds at 89, 157, 183 and 190 GHz via a “quasi-optical” arrangement of lenses, dichroic plates and a polarizing beam splitter. The instrument channels and pass-band characteristics are as shown in Table 3.9.1-1 and Figure 3.9.1-1.

**Table 3.9.1-1. MHS Channels and Passband Characteristics.**

Channel (Note 1)	Central Frequency (GHz)	No of Passbands	RF Bandwidth (MHz) (Note 2)	NEΔT (K) (Note 3)	Polarization (Note 4)
H1	89.0	1	2800	0.22	V

H2	157.0	1	2800	0.34	V
H3	183.311 ± 1.0	2	2 x 500	0.51	H
H4	183.311 ± 3.0	2	2 x 1000	0.40	H
H5	190.311	1	2200	0.46	V

The microwave signal at the output of each of the four feeds is down-converted to Intermediate Frequency (IF) using a super-heterodyne receiver. Each receiver consists of a mixer with its associated local oscillator, an amplifier, and an IF filtering and video detection chain. The channels H3 and H4, sharing the same receiver, are separated by a diplexer and dedicated filters at IF level. Thus, five baseband signals are generated.

These signals, after low-pass filtering and removal of the DC component, are digitized and then further averaged over each pixel integration period. The final pixel result is formatted into a packet along with the calibration data, to constitute the scientific data to be used on the ground.

Radiance for the Earth views is derived from the measured counts and the calibration coefficients inferred from the internal black body and space view data. The black body temperature is accurately measured by a set of Platinum Resistance Thermometers (PRT). Moreover, the direction of the space view for cold reference can be adjusted after launch to optimize calibration with respect to spurious radiation sources.

The scientific data generated by MHS are sent to the spacecraft via the MHS Interface Unit (MIU) on the Science Data (SD) bus using Consultative Committee for Space Data Systems (CCSDS) packet formats. Instrument command, control and telemetry functions are also achieved through the MIU, using a separate Command/Telemetry (CT) bus, also using CCSDS packet formats.

The MHS instrument has a high degree of internal redundancy, which is managed by external commands underground control.

### 3.9.2 SYSTEM DESCRIPTION

#### 3.9.2.1 General Configuration

The MHS instrument mechanical configuration is shown in Figure 3.9.2.1-1. The instrument consists of three major assemblies:

- 1) Receiver assembly, including the Quasi-Optics and Front-End Assembly (QOFEA) with its quasi-optical components, feeds, local oscillators or Q-band Sources (QBS), mixers, low-noise amplifiers and down-converters, and the Intermediate Frequency Back-End (IFBE), consisting of IF filters, detector diodes and baseband amplifiers.

- 2) Scan Mechanism, comprising the Reflector Drive Module (RDM) carrying the rotating reflector and motor, and the Flywheel Drive Module (FDM) with the counter-rotating momentum compensation flywheel and associated motor.
- 3) Electronics Equipment (EE), consisting of circuit modules providing the following functions:

- Processor and Interface Electronics (PIE)
- Signal Processing Electronics (SPE)
- Scan Control Electronics (SCE)
- Power Supply Electronics (PSE)

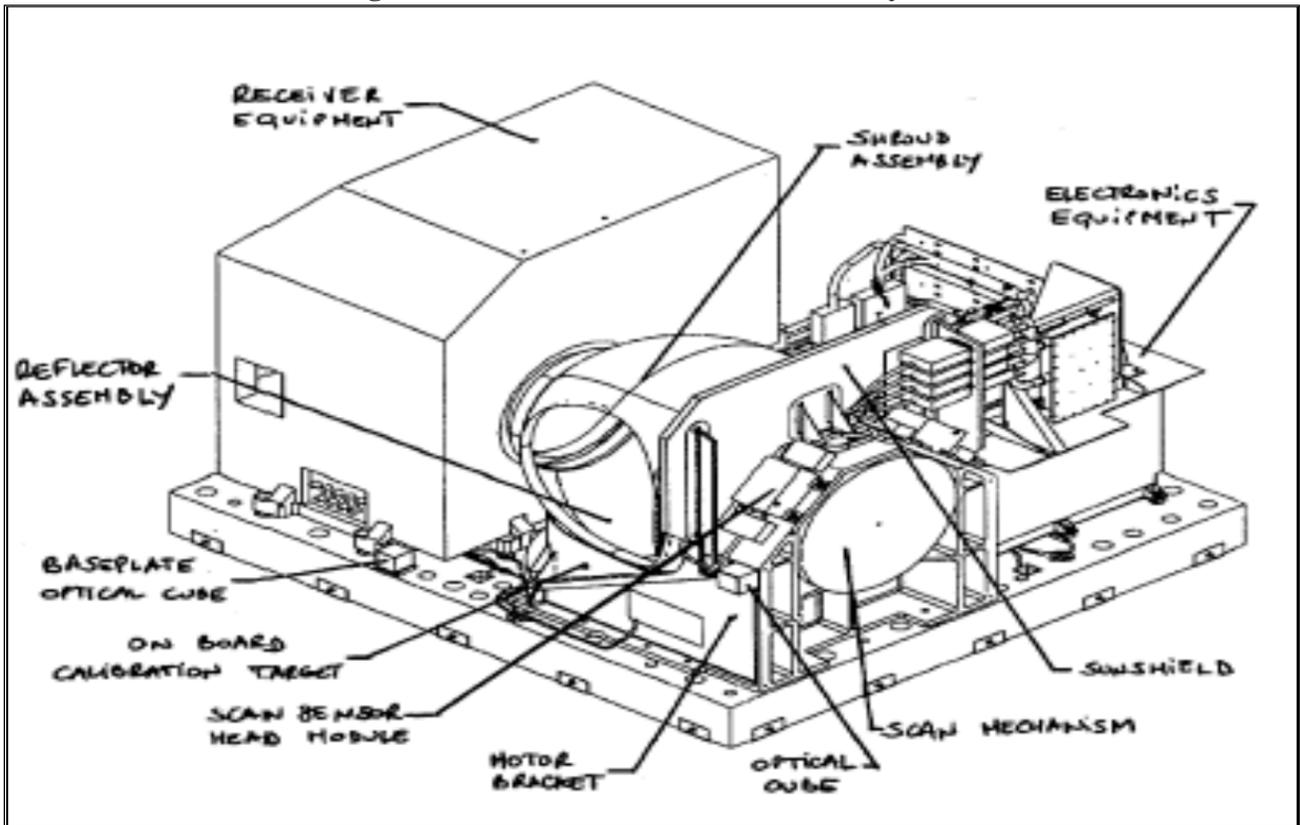

All three major assemblies are mounted on a common structural baseplate, assuring the mechanical interface to the satellite. The instrument baseplate also hosts the following minor assemblies:

- On-Board Calibration Target (OBCT)
- Motor Bracket and sunshield
- Thermal hardware (thermistors, thermostats and heaters)

Electrical interface connectors are on the outer envelope of the Electronics Equipment.

The MHS instrument operates at ambient temperature and does not require cooling systems. Thermal control is operated passively, using a combination of thermal insulation and radiative surfaces, the latter specifically used for dissipating the power of the receiver and the electronics equipment. Heaters are provided to speed up the warm-up time of the instrument from switch-on. A thermostat-driven survival heater network is also provided to maintain safe temperatures when the instrument is switched off.

Figure 3.9.2.1-1. MHS General Assembly

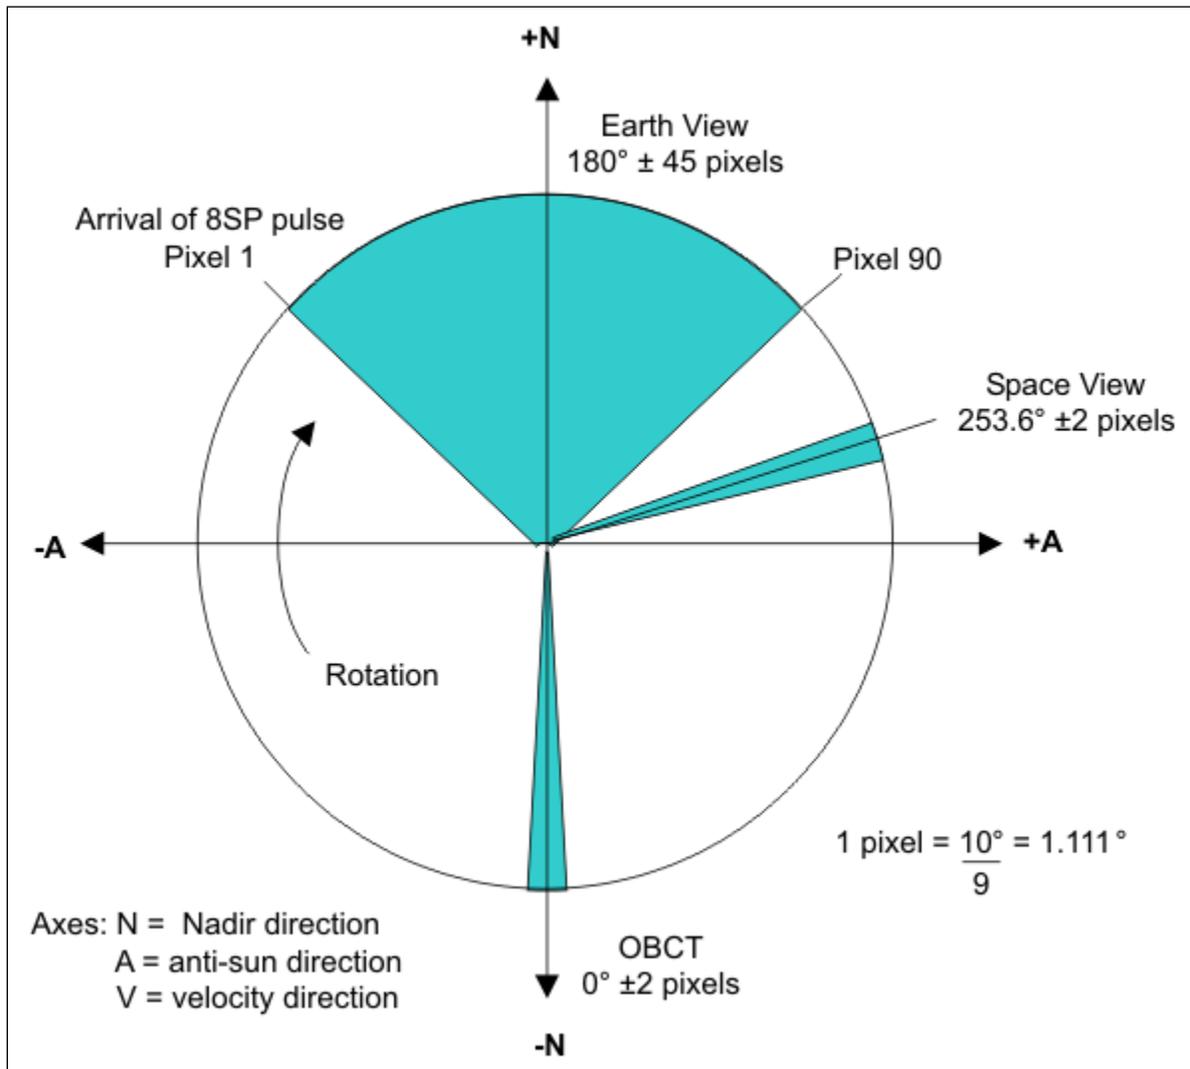

### 3.9.2.2 Scanning Concept

A closed-loop mechanism, based on brushless motors and contactless position sensors, is used to rotate the parabolic mirror every 2.67 seconds, to provide the Earth scanning and calibration functions. Figure 3.9.2.2-1 shows the scanning concept.

At each rotation the Earth field of view is scanned at constant speed, then the mirror is directed towards cold space and the internal target before starting the following scan. The scan velocity profile is optimized for maximum radiometric sensitivity. A counter-rotating flywheel is used to compensate momentum induced on the satellite by variations of the scan velocity. The reflector is provided with a co-rotating shroud, to minimize unwanted thermal radiation.

The scanning system is also capable of keeping the reflector indefinitely fixed to a desired position, on ground command, for special calibration purposes during the on-orbit verification phase, and return on command to nominal scan mode.

**Figure 3.9.2.2-1. MHS Scanning Principle**

### 3.9.2.3 Calibration Concept

MHS data calibration is based on measurements of two reference targets, namely the instrument cold space view (cold reference) and the On Board Calibration Target (OBCT) which is the hot reference. Both targets are sampled at every scan rotation. In order to reduce measurement noise on calibration data, four samples at each position are taken during each scan and averaged over several scans.

The OBCT is a black body whose temperature is left floating in thermal equilibrium with its environment. It consists of an array of pyramids coated with radio frequency absorbing material, having a uniform temperature over its surface. This temperature is accurately measured by a set

of Platinum Resistance Thermometers (PRT) located in various regions of the OBCT and used for on-ground processing of the radiometric data.

The accuracy of calibration mainly relies on the precision of PRTs and on the knowledge of unwanted thermal radiation sources affecting the measurement on the cold space view. In order to improve this knowledge, a special scanning mode is activated (during the on-orbit verification phase, shortly after launch) to characterize the in-flight radiative contributions. The position of the cold space view can be adjusted after launch to optimize the calibration process with respect to those disturbances.

The calibration coefficients in terms of gain and offset are calculated, appended to the raw data and used for further processing on ground (i.e. radiance, brightness temperature, etc). Non-linearity of the instrument transfer function is only measured on ground.

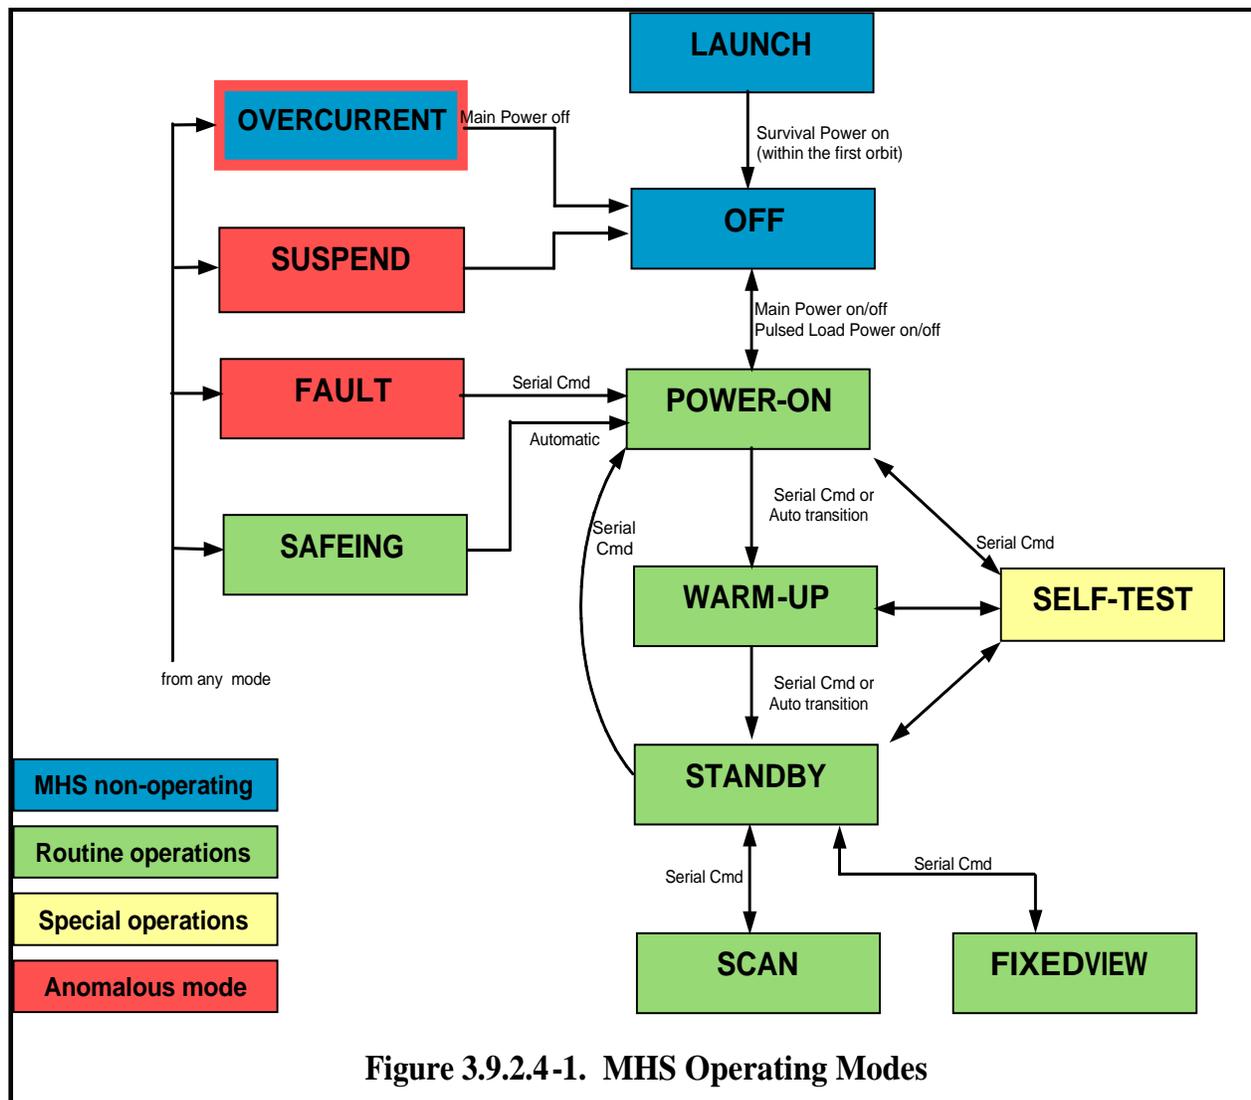

#### 3.9.2.4 Modes of Operation

The MHS Instrument operation modes are as shown in Fig. 3.9.2.4-1.

In the Launch mode the instrument is totally unpowered and its temperatures are not controlled. Transition to Off Mode occurs when the Survival Power is applied. The Survival Heaters controlled by a thermostat network are used to maintain equipment temperatures within their non-operating safe limits. In all other modes, the instrument temperatures are maintained by the thermal dissipation occurring in the electrical equipment, with the aid of operational heaters under control of the instrument. The application of Survival Power, and thus the transition from Launch to Off mode, is expected on NOAA-N and NOAA-N' just a few hours after launch, so that dangerously low temperatures are not reached because of thermal inertia of the instrument. For safety reasons, it has been recommended never to switch off the Survival Power Bus, although no current is drawn from it during nominal operation.

The Power-On mode is entered when power is applied to both the Main and Pulse Load busses. The Electronics Equipment (EE) is switched on, initializing the on-board processing software (MINOS) and establishing command and telemetry links between the MHS and the satellite. The health and status of MHS will then be provided in the form of Housekeeping data. The unpowered equipment (Receiver and Scan Mechanism) is warmed, through the use of operational heaters, to reach their minimum switch-on temperatures.

In the Warm-up mode the instrument equipment is fully powered and thermal transition to the nominal operating temperature occurs thanks to the internal power dissipation, with the help of operational heaters for the Scan Mechanism. The Stand-by mode is achieved when the MHS Instrument is ready to perform its nominal scan operations. All equipment are at full performance temperatures and the circuits are powered. The Reflector, after an initialization cycle, is set stationary and pointing at the OBCT, under closed loop control.

The Scan Mode is the normal operating mode of the MHS Instrument. All equipment is active and science data are produced as output. The Fixed View mode is nominally operated only during the initial on-orbit verification. The same activities as Scan Mode are taking place except that the Reflector is not performing the nominal scan but is pointing at a fixed position. Radiometric data are collected at pixel times equivalent to the Earth, Space and OBCT view periods of Scan Mode and placed in the corresponding positions of the Science Data Package.

The Safeing mode is entered on specific external command. The instrument is placed in a safe configuration in readiness for the removal of power. The Reflector is parked at the OBCT to prevent sun illumination in case of a change in the platform attitude.

The Fault mode, Overcurrent mode and Suspend mode are automatically entered whenever the MHS electronics detects an anomaly in the instrument behavior. The configuration is changed to

minimize the chance of permanent damage to any part of the MHS Instrument. A Self-Test mode is provided to allow specific functions of the MHS Instrument to be exercised and tested for the purposes of detailed MHS Instrument health monitoring and diagnostics in case of anomaly.

## 4.0 REAL TIME DATA SYSTEMS FOR LOCAL USERS

This section describes the real-time systems which are available for NOAA KLM direct readout users. These systems include the High Resolution Picture Transmission (HRPT), the Automatic Picture Transmission (APT), Direct Sounder Broadcast (DSB) and the Data Collection System (DCS). Transmission characteristics, data frame formats and synchronization details are given for each of the above mentioned systems.

### 4.1 HRPT SYSTEM

#### 4.1.1 GENERAL

The High Resolution Picture Transmission (HRPT) system provides data from all spacecraft instruments at a rate of 665,400 bps. The S-band realtime transmission consists of the digitized unprocessed output of five AVHRR/3 channels, plus the TIP (HIRS/3, SBUV/2, SEM, and DCS/2) data and AMSU data. All information necessary to calibrate the instrument outputs is included in the data stream.

During NOAA-K activation and evaluation, it was determined that AMSU-A channels 7 and 15 were switched. This switch should be transparent to Level 1b users as the channels were corrected (switched back) by the ingest software, however, direct readout users should be aware of this problem. Only the radiometric data was affected, the housekeeping temperatures of channels 15 and 7 oscillators are correct as they are now. The antenna patterns, beam efficiency and beam widths are correct as they were not affected by the switch. Band pass for channels 7 and 15 was not affected due to extremely broad rf-detectors.

#### 4.1.2 TRANSMISSION CHARACTERISTICS

The S-band transmission of time multiplexed, digital data is in a split phase format. For NOAA KLM, split phase data "0" is defined as being +68 degrees phase during the first half of the bit period and -68 degrees during the second half of the bit period. The split phase data "1" is defined as being -68 degrees phase during the first half of the bit period and +68 degrees phase during the second half of the bit period, for NOAA KLM. Note, the NOAA-N,-N satellites have a slightly different phase angle (see Table 4.1.2-2). Table 4.1.2-1 shows the general characteristics of the HRPT transmission system, while the general HRPT parameters for both NOAA KLM and NOAA-N,-N are shown in Table 4.1.2-2.

<b>Table 4.1.2-1. HRPT Transmission Characteristics.</b>	
Line Rate	360 lines/minute
Data Channels	5 transmitted, 6 available
Data Resolution	1.1 km
Carrier Modulation	Digital split phase, phase modulated

### 4.1.3 HRPT MINOR FRAME FORMAT

The MIRP outputs the HRPT format simultaneously with the Automatic Picture Transmission (APT), Global Area Coverage (GAC) and Local Area Coverage (LAC) formats. GAC and LAC data are not considered real time, as these data are stored on the spacecraft digital recorders for readout by the CDA stations. The HRPT data format consists of a major frame which is subdivided into three minor frames.

Of special note is the flag in the telemetry (Word 7, Bit 10) which will indicate which of AVHRR/3 channel 3 sensors (3A or 3B) is operating. When channel 3B is selected, the patch temperature data is output every scan line (during the backscan), and every other scan line when channel 3A is selected. The data output will switch instantaneously between 3A and 3B upon

command, even if the scan is in the middle of a line. However, the way the flag operates there is one scan line of uncertainty when switching from 3B to 3A, and two lines of uncertainty when switching from 3A to 3B.

#### 4.1.3.1 HRPT Minor Frame Format for NOAA KLM

On NOAA KLM, TIP and AMSU data are updated at the major frame rate. That is, the three minor frames which make up the major frame will contain TIP data in the first minor frame, backfill in the second minor frame, and AMSU data from the AIP, in the third minor frame. In the previous series of satellites (NOAA E-J), the major frame consisted of three minor frames of only the TIP data. The details of the HRPT, AIP, and TIP minor frame formats for NOAA KLM are shown in Tables 4.1.3.1-1, 4.1.5.1-1 and 4.3.3.1-1, respectively.

Of special note here is the flag in the telemetry (Word 7, Bit 10) which will indicate which of AVHRR/3 channel 3 sensors (3A or 3B) is operating. When channel 3B is selected, the patch temperature data is output every scan line (during the backscan), and every other scan line when channel 3A is selected. The data output will switch instantaneously between 3A and 3B upon command, even if the scan is in the middle of a line. However, the way the flag operates there is one scan line of uncertainty when switching from 3B to 3A, and two lines of uncertainty when switching from 3A to 3B.

Table 4.1.3.1-1 describes the minor frame format for HRPT on the NOAA KLM satellites.

<b>Table 4.1.3.1-1. HRPT Minor Frame Format for NOAA KLM.</b>					
<b>Function</b>	<b>No. of Words</b>	<b>Word Position</b>	<b>Bit No. 1 2 3 4 5 6 7 8 9 10</b>	<b>Plus Word Code &amp; Meaning</b>	<b>Notes</b>

**Notes:**

- 1) First 60 bits from 63 bit PN generator started in the all 1's state. The generator polynomial is  $X^6+X^5+X^2+X+1$
- 2) AVHRR Internal Target Temperature Data. Three readings from one of the four platinum resistance thermometers (PRT). A different PRT is sampled for each scan; every fifth scan will contain a reference value of 0 in place of each reading.
- 3) 104 words includes 103 words of the AMSU frame plus the first word of TIP
- 4) Derived by inverting the output of a 1023 bit PN sequence provided by a feedback shift register generating the polynomial:  $X^{10}+X^5+X^2+X+1$ . The generator is started in all 1's state at the beginning of word 7 of each minor frame.
- 5) Each minor frame contains the data obtained during one Earth scan of the AVHRR sensor. The data from the five sensor channels of the AVHRR are time multiplexed as indicated.
- 6) Derived from the non-inverted output of a 1023 bit PN sequence provided by a feedback shift register generating the polynomial:  $X^{10}+X^5+X^2+X+1$ . The generator is started in the all 1's state at the beginning of word 10,991.

4.1.3.2 HRPT Minor Frame Format for NOAA-N,-N'

On NOAA-N,-N', the HRPT format provides a major frame, which is made up of three minor frames. TIP and AMSU/MHS data are updated at the major frame rate. That is, the three minor frames, which make up a major frame, will contain TIP data in the first minor frame, backfill in the second minor frame, and AMSU/MHS data in the third minor frame. The HRPT is provided in a split phase format to the S-Band Transmitter. The S-band transmission of time multiplexed, digital data is in a split phase format. The split phase data 0" is defined as being +67° phase during the first half of the bit period and -67° phase during the second half of the bit period. The split phase data 1" is defined as being -67° phase during the first half of the bit period and +67° during the second half of the bit period. The time code contained in each minor frame indicates the spacecraft time  $1.13 \pm 0.5$  milliseconds before the beginning of bit 1 of word 1. The HRPT minor frame format for NOAA-N,-N' is shown in Table 4.1.3.2-1.

Table 4.1.3.2-1. HRPT Minor Frame Format for NOAA-N, -N'.

**NOTES:**

1. First 60 bits from 63 bit PN generator started in the all 1's state. The generator polynomial is  $X^6+X^5+X^2+X+1$
2. Each of these words is a 5 channel subcom; 4 words of IR data plus subcom sync (10 A0"s)
3. The 104th word of each AMSU/MHS data frame of the MIRP contains 1110110100.
4. Derived by inverting the output of a 1023 bit PN sequence provided by a feedback shift register generating the polynomial:  $X^{10}+X^5+X^2+X+1$ . The generator is started in all 1's state at the beginning of word 7 of each minor frame.
5. Each minor frame contains the data obtained during one Earth scan of the AVHRR sensor. The data from the five sensor channels of the AVHRR are time multiplexed as indicated.
6. Derived from the non-inverted output of a 1023 bit PN sequence provided by a feedback shift register generating the polynomial:  $X^{10}+X^5+X^2+X+1$ . The generator is started in the all 1's state at the beginning of word 10,991.

#### 4.1.4 DIGITAL "A" TELEMETRY

The output data signals supplied by the instrument to the spacecraft can be assigned to three categories: 1) instrument Digital "A" (scientific) data; 2) Digital "B" Telemetry; and 3) Analog Telemetry. For purposes of this document, Digital "A" data are described in this section

##### 4.1.4.1 AMSU-A1 for NOAA KLM

The AMSU-A1 Digital "A" telemetry incorporates all of the radiometric data taken during one scan. It also includes the data from the on-orbit calibrations. In the Full Scan Mode, the AMSU-A1 for NOAA KLM and NOAA-N, N' has 1,244 Digital "A" telemetry points, as identified in Table 4.1.4.1-1.

**Note:**

1) For S/N 102: Read PRT temperature. Read voltage of lock detect signal and convert to temperature using the following formula:  $t = (8.73 \times V) - 23.5$  where  $t$  is the temperature (in C) and  $V$  is the measured lock detect voltage signal. If the temperature given by the PRT reading and the formula are in agreement within  $\pm 5C$ , then use the PRT reading as it was intended. If the temperature difference is greater than  $\pm 5C$ , then use the temperature interpreted from lock detect signal. At initial power on of PLLO#2 before PLLO#2 is fully self heated and stabilized, use within  $\pm 5C$  rule with reference A1-1 (PRT #33) RF -shelf temperature. The within  $\pm 5C$  rule does not apply right after PLLO was operational and was switched off and then back on. In this case, wait half an hour for PLLO#2 to cool down before temperature extraction method can be selected correctly. The formula  $t = (8.75 \times V) - 23.5$  is usable only between 2.5V to +8.4V or -1.6 to 50 C.

4.1.4.2 AMSU-A2 for NOAA KLM

The AMSU-A2 Digital "A" telemetry incorporates all of the radiometric data taken during one scan. It also includes the data from the on-orbit calibrations. The AMSU-A2 has 316 Digital "A" telemetry points, as described in Table 4.1.4.2-1, in the Full Scan Mode.

316	Unit Identification and Serial Number

**Notes:**

1. MSP is the most significant portion of a particular measurement while the LSP is the least significant portion of the particular measurement.
- 2) The first set of readings for a particular reflector position are made prior to the integration interval; the second set of readings are made approximately half way through the integration period.
- 3) Digital “A” data as read by the spacecraft shall contain an undetermined number of “fill words”. These fill words shall be 0001H and will be intermingled with valid data. The Digital “A” data as sent by the instrument shall be such that no valid data of 0001H shall be included.
- 4) Format of Position data is DDDDDDDDDDDDDDE0, where:  
D=Data  
E=Error bit: 0=not in spec, 1=spec.  
0=Zero
- 5) Format of Radiometer data is DDDDDDDDDDDDDDD0, where:  
D=Data  
0=Zero
- 6) Temperature sensor reference voltage is utilized for temperature sensors 13 through 19 only.

#### 4.1.4.3 AMSU-B for NOAA KLM

Digital "A" Data is clocked into the spacecraft AIP at a 16.64 kbps rate by the shift pulse whenever the Data Enable Pulse is presented to the instrument. The AMSU-B data is in the AIP minor frame words 48 through 97. The AIP reads the digital data output from the AMSU-B in 16 bit words.

The AMSU-B telemetry format consists of 78 minor frames of data. Minor frames 1 and 80 in each 8 second cycle are blank: i.e. no data is available in the PEU digital data FIFO during the first and last minor frames of each 8 second format. The 78 minor frames are organized as three blocks of 650 words as follows (representing one scan of the instrument):

36 spare words

540 words of Earth view pixel data  
(90 x (5 channels + shaft position at mid-pixel))

26 words of housekeeping data

48 words of space view and target view data  
(2 x 4 x (5 channels + shaft position))

This structure is maintained for all modes. In static modes, all pixel data locations contain the pixel data for the current antenna position.

The AMSU-B digital format is synchronized to the 8 second synchronization pulse. During each minor frame, 25 words of data are available in the PEU O/P FIFO within 16.7 milliseconds of the start of the minor frame (except in frames 1 and 80). Table 4.1.4.3-1 shows the AMSU-B digital A data format.

Word Length: 16 bits

Serial Output: 25 - 16 bit words per 100 sec (MSB first)

NOTES ON THE PREVIOUS TABLES:

The format consists of minor frames (1 to 80). Minor frames 1 and 80 are blank. This means that no data is available in the PEU output FIFO for reading by the AIP and therefore the AIP should not send any sample pulses to AMSU-B during these minor frame periods.

Table 4.1.4.3-2 indicates the meanings for the variables used in Table 4.1.4.3-1:

<b>Table 4.1.4.3-2. Meaning of Variables in Table 4.1.4.3-1.</b>	
<b>Key</b>	<b>Meaning</b>
SP	Spare word (Data is 5555H except for spare words 34 to 36)
TSTxx	Test Data
P/n	Shaft position at mid-integration time for FOV n.
16/n	Integrated output for channel 16 for FOV n.
17/n	Integrated output for channel 17 for FOV n.
18/n	Integrated output for channel 18 for FOV n.
19/n	Integrated output for channel 19 for FOV n.
20/n	Integrated output for channel 20 for FOV n.
/Sn	Space view FOV n.
/Tn	Internal Target view FOV n.
Axx	Multiplexed Housekeeping data.

<b>Table 4.1.3-3. AMSU-B Data Word Description</b>	
<b>Digital Sub-multiplexed Channels</b>	
A01	Unit ID + Flags
A02	Digital b Telemetry
A03	Mixer 16 Temperature
A04	Mixer 17 Temperature
A05	Mixer 18/19/20 Temperature
A06	FET Amplifier 16 Temperature
A07	FET Amplifier 17 Temperature
A08	FET Amplifier 18 Temperature
A09	FET Amplifier 19 Temperature
A10	FET Amplifier 20 Temperature
A11	Calibration Target Temperature 1
A12	Calibration Target Temperature 2
A13	Calibration Target Temperature 3
A14	Calibration Target Temperature 4
A15	Calibration Target Temperature 5
A16	Calibration Target Temperature 6
A17	Calibration Target Temperature 7
A18	Sub-reflector Temperature 1
A19	Local Oscillator Monitor Current 16
A20	Local Oscillator Monitor Current 17

Bit	A02 (See Note 1)
00 (LSB)	Power On/Off (Relay 1 status)
01	Survival heater On/Off (Relay 2 status)
02	Scan normal mode
03	Parked in target view mode
04	Parked in nadir view mode
05	Parked in space view mode
06	Investigation mode
07	Stepped Mode
08	Channel 16 On/Off (Relay 3 status)
09	Channel 17 On/Off (Relay 4 Status)
10	Channel 18/19/20 On/Off (Relay 5 status)
11	Space View Select (MSB)
12	Space View Select (LSB)
13	Memory checks status
14	ROM check flag
15 (MSB)	RAM check flag
<b>Note:</b>	
1. A "1" status indicates "ON" and a "0" (zero) status indicates "OFF."	

The format structure and definition is identical for all modes. In scanning modes, n, Sn and Tn represent pixel identification. In static modes, n, Sn and Tn have no meaning; all data values relate to the IFOV.

#### 4.1.4.4 MHS for NOAA-N,-N'

The Microwave Humidity Sounder (MHS) instrument replaced the AMSU-B instrument on NOAA-N and -N'. Scientifically, the MHS is very similar to the AMSU-B instrument, but the manner in which the data are output is quite different. The equivalent of "Digital" data on AMSU-B is referred to as "science data telemetry" or just "science data" for the MHS instrument, and comes packaged in a "science data telemetry packet" or "Science Packet" (SCI PKT) for short.

The NOAA-N, N' MHS instrument science data is delayed by two scan lines (or 5 2/3 seconds). The operational Level 1b data accounts for the delay and provides correct geo-location information. The delay, however, is not accounted for in the HRPT broadcast. The two scan line delay is caused by data buffering within the MHS instrument and the spacecraft data handling subsystem.

Consultative Committee for Space Data Systems (CCSDS) is composed of space agencies and industrial associates worldwide, working together to provide well-engineered, standardized solutions for common space data handling needs. The benefits of using CCSDS include: reduced cost, risk and development time, as well as enhanced interoperability and cross-support. For more information on CCSDS, refer to their website at: <http://www.ccsds.org/>. The data packets for MHS are in CCSDS format (i.e., a primary header, secondary header and checksum).

The MHS instrument and its associated interface unit (the MIU) on the NOAA satellites can operate in a variety of different modes and output several different packets, or formats, of data. There are nine different modes for the MHS (see Table 4.1.4.4-1 for details). In addition, all the MHS output must be funneled through a new processor, the MHS Interface Unit (MIU), which may ignore the MHS data completely and output its own telemetry instead. Depending on what mode the MIU is in, different information will be output. For purposes of this Users Guide, only the modes in which MHS data are output will be documented.

The MHS instrument, and its associated interface unit (the MIU) on the NOAA satellites, can operate in a variety of different modes and output several different packets, or formats, of data. There are nine different modes for the MHS (see Table 4.1.4.4-1 for details). In addition, all the MHS output must be funneled through a new processor, the MHS Interface Unit (MIU), which may ignore the MHS data completely and output its own telemetry instead. Depending on what mode the MIU is in, different information will be output. For purposes of this Users Guide, only the modes in which MHS data are output will be documented.

<b>Table 4.1.4.4-1. MHS modes.</b>	
<b>MHS Mode</b>	<b>MHS Output</b>

Standby	Empty Science Data Packet
Scan	Science Data Packet
Fixed View	Science Data Packet
Self-test	Extended Test Data Packet
Safeing	Empty Science Data Packet
Fault	Empty Science Data Packet
Memory Dump	Extended Memory Data Packet

The MHS instrument only interfaces to the MIU box. The MIU interfaces to the rest of the NOAA-N, N spacecraft through the TIROS Command and Control Subsystem (CCS), the TIROS Data Handling Subsystem (DHS) and the TIROS Electrical Power Subsystem (EPS). The EPS portion interfacing to the MIU is the Power Subsystem Electronics (PSE) consisting of the 28 v Bus Main, Pulse Load, and Survival Buses. All power is distributed to the MHS through the MIU. The AMSU Information Processor (AIP), the Cross-Strapping Unit (XSU) and the TIROS Information Processor (TIP) boxes comprise the DHS part, while the Control Interface Unit (CIU) is the CCS interface portion of the MIU unit. All of these boxes utilize legacy bus architecture interfaces to the MIU while the MIU implements a Military Standard (MIL-STD) 1553B redundant interface to the MHS instrument. A single 1553 bus is used for commanding (CMD), housekeeping (HK) telemetry and for science (SCI) data telemetry packets between the MHS and the MIU. However, the MIU, being the bus controller, determines whether the primary or redundant 1553 bus is utilized. Other than the 1553 bus, there is no redundancy in the MIU. The MHS is redundant internally, having both A and B sides to its

electronics. The MIU supplies telemetry (MHS and MIU) to the ground during all operational modes. It also provides MHS survival temperature telemetry to the TIP even when the MHS and MIU are not powered.

The AIP provides a serial data stream from the spacecraft, which may be transmitted to the ground or embedded into other composite data streams. Within the AIP data, information is collected from the TIP, AMSU-A1, AMSU-A2, and the MIU. The TIP controls the basic data frame timing, generating a minor frame every tenth of a second (in Orbit Mode) and repeating the entire sequence every 32 seconds, called a major frame. The AIP is synchronized to the TIP timing using the 32-second major frame synchronization, and the harmonically related one-tenth second (10 Hz) pulse. The AIP itself has an 8-second major frame, which means it repeats its sequence four times during a TIP major frame.

Since the TIP and AIP minor frames are both 10 Hz, they are locked together, using the TIP synch timing. The TIP 32-second major frame pulse synchronizes the AIP. AIP generates its own 8-second timing, but since that period is harmonically related, it will not drift significantly from the 32-second pulse. AIP keeps the data from the AMSU's and MIU synchronized by passing on the timing pulses as appropriate.

The AIP stores the data from all four inputs in serial buffers during one minor frame, and sequences it into the data stream in the subsequent frame. This is mechanized using two sets of alternate buffers. AIP will initiate the data transfer with the 10 Hz sync, followed by the appropriate number of word strobes, 56 in the case of the MIU. The sync serves only to define the start of the transfer. The actual timing of the strobes will differ for each data source, and in the case of the MIU may not even be continuous, but it will always follow the sync.

The MIU provides a total of 80 sets of 56 8-bit words, called minor cycles, each of which will be inserted into an AIP minor frame. A minor cycle counter within the MIU keeps track of the frame sequence, and its content is included in the 56-word data sequence. Because of the double buffer arrangement, the MIU minor cycle count may not agree exactly with the AIP minor frame. However, the 8-second sync pulse will ensure that they are sequencing together uniformly, counting the same 80 frames.

The 56-word count is synchronized using the 10 Hz pulse, so that the first word will be transferred by the strobe following the synch. The data from the MHS is partially synchronized to the TIP timing, but the MIL-STD-1553 interface bus and MHS scanning mechanics prevent an exact match. Therefore, the MIU receives the MHS data packets, and packages them along with housekeeping telemetry, to produce the 56-word AIP data.

The 10 Hz and the 8-second sync pulses are received at the MIU and applied to the software using two discrete interrupts. Although both signals are intended to be continuous over long periods, a change in system clocking may result in a jump in either one, which causes it to be early or late with respect to previous pulse timing. The MIU is expected to resynchronize itself to the new sequence.

All AIP telemetry includes the Telemetry Frame Header data in words 6-7 of every minor frame.

This is the same data and format as in the TIP Telemetry described in Table 4.1.4.4-5. Table 4.1.4.4-2 contains the format of the MIU AIP data for bytes 6-7.

<b>Table 4.1.4.4-2. MIU AIP Bytes 6 and 7.</b>

**Note:**

1. Packet 2 (PKT 2) reports the prior 8-second period (n-1).

Some of the terms used in the above table are explained here. There are five transaction types: NIL, MISC (Miscellaneous), HK (Housekeeping), SCI (Science) and CMD (Command). The NIL cycle is described as a placeholder (No Operation) mode. Its purpose is to kill time until time to perform another operation. MISC cycle outputs test results from WRAP and BIT for the housekeeping and Science RT channels. Housekeeping Cycle sends failed and re-try counters on Housekeeping issues from bytes 48-73. Science Cycle sends various failed and re-try counters on SCI issues from bytes 48-73. Command Cycle sends various failed and re-try counters on CMD issues from bytes 48-73.

Table 4.1.4.4-5 depicts the data sent in bytes 98-101 during AIP Normal Telemetry mode. This data repeats four times per major frame beginning with major and minor cycle counts in minor frames 0, 20, 40 and 60. Telemetry data I/O Reads are sent in bytes 98-99 during minor frames 2, 22, 42 and 62. Some of the key telemetry data from these AIP bytes 98-101 include TIP and AIP First In First Out (FIFO) status, Bus Controller state, CIU State, Uplink queue, CMD VERIF word, Error counts, Memory dump stats, Time and Error Log Indices.

TIROS Information Processor (TIP) telemetry from the MIU is supplied as 8-bits in Byte 102 of each TIP minor frame (this corresponds to AIP minor frame byte 205). The content of an MHS telemetry packet is essentially a subset of the science data packet. It contains telemetry data, except not as much as is found in a science data packet, but no science data (i.e., no views of earth and the warm and cold targets). The format of the MIU TIP Telemetry Frame (normal) is given in Table 4.1.4.4-6.

<b>Table 4.1.4.4-6. MIU TIP Telemetry Frame - Normal.</b>

65-79, 0	0-128	Scan Period 1 Housekeeping Packet; 16 bytes HK/packet			

**Notes:**

1. Scan Period 2 is reporting prior 8-second frame (n-1).
2. When TIP ENGR Frame is enabled, disregard MIU 1 indications of Normal in this mode.

Table 4.1.4.4-7 lists the telemetry packet types that are generated on the Science Data Bus:

<b>Table 4.1.4.4-7. Science Data Bus telemetry packet types.</b>	
<b>Packet Type</b>	<b>Total Packet Length (octets)</b>
Science Data Packet	1300
Extended Memory Data Packet (EMDP)	1042
Extended Test Data Packet (ETDP)	1300

The Packets are in Consultative Committee for Space Data Systems (CCSDS) format (i.e., a primary header, secondary header and checksum). The detailed structure of the Source Data field is given in the following sections.

Table 4.1.4.4-8 shows the fields that the Science Data Packets contain.

<b>Table 4.1.4.4-8. Science Data Packet Fields.</b>	
<b>Field Name</b>	<b>Size (Octets)</b>
Full Housekeeping Data	39
Status Word	1
Signal Processing Status	9
Pixel Data	1176
OBCT Temperature Data	16
Spares	45

The format of the Full Housekeeping Data field is described at the end of this section. In modes which do not generate Science Data (i.e. all modes except Scan Mode and Fixed View Mode), an Empty Science Data Packet is generated, in which the remaining fields of the Science Data Packet are undefined.

The format of the spares field is unallocated at present. All octets will be set to "00". Table 4.1.4.4-9 shows the format of the Status Word.

<b>Table 4.1.4.4-9. Format of the Status Word Field.</b>							
<b>MSB</b>							<b>LSB</b>
DC Offset Valid	Scan Control Valid	Profile		Unused			

The DC Offset Valid bit is set to a 1" when all channels calibration targets readings lie within acceptable limits, as determined by the DC Offset Algorithm. This bit will be set only in Scan Mode when the calibration targets are sampled.

The Scan Control Valid bit is set to a 1" if all mid-pixel positions of the reflector during Earth, Space and On-Board Calibration Target (OBCT) views are within the limits for the Scan Mode

profile, or within the limits of the requested position in Fixed View Mode. This bit will be set only in Scan Mode or Fixed View Mode.

The Profile code is set to:

00 : Profile 0

01 : Profile 1

10 : Profile 2

11 : No Profile calculated (profile will be manually loaded/modified)

It is intended that Profile 0 will define the Nominal Scan Mode Profile with nominal Space View position. Profiles 1 and 2 will nominally be used for the alternate Space view positions.

However, any profile can be reprogrammed to another position versus time profile by reloading the Scan Control Table profile parameters.

The format of the Signal Processing Status field is shown in Table 4.1.4.4-10.

<b>Table 4.1.4.4-10. Format of Signal Processing Status Field.</b>					
<b>MSB</b>					<b>LSB</b>
Channel H1 DC Offset Word					
Channel H2 DC Offset Word					
Channel H3 DC Offset Word					
Channel H4 DC Offset Word					
Channel H5 DC Offset Word					
H1 VALID	H2 VALID	H3 VALID	H4 VALID	H5 VALID	SPE MUX CODE
H1 GAIN			H2 GAIN		UNUSED
H3 GAIN			H4 GAIN		UNUSED
H5 GAIN			UNUSED		UNUSED

The Valid bit is set to a "1" when all samples of this channel for this scan revolution lie within the ADC dynamic range. H1..H5 are the five input channels from the Receiver. The Electronics Equipment (EE) has six signal processing channels, SPE1..SPE6. In the nominal configuration, the Receiver channel is connected to the corresponding EE channel, e.g., H1 to SPE1, and SPE6 is unused.

The SPE Mux Code is used to identify which Receiver channel, if any, is connected to the EE redundant channel, as shown in Table 4.1.4.4-11.

<b>Table 4.1.4.4-11. SPE MUX Code Subfield format.</b>	
<b>SPE MUX Code</b>	<b>Configuration</b>
000	H1 to SPE 6
001	H2 to SPE 6
010	H3 to SPE 6
011	SPE 6 not used
100	H4 to SPE 6
101	H5 to SPE6

110	SPE6 not used
111	SPE6 not used

The H1...H5 Gain Fields identify the gain settings of the Receiver video output channels as in Table 4.1.4.4-12.

<b>Table 4.1.4.4-12. Receiver Gains Sub Field.</b>	
<b>Gain Code</b>	<b>Gain</b>
000	0 dB
001	1 dB
010	2 dB
011	3 dB
1xx	not used

The Science Data field can be separated into Earth, Space and OBCT View Data fields, which all follow a common format. They are differentiated only by the source of the data that is written to them. The fields are arranged as shown in Table 4.1.4.4-13.

<b>Table 4.1.4.4-13. Science Data Field Format.</b>	
<b>Field name</b>	<b>Number of Pixel subfields</b>
Earth	90
Space	4
OBCT	4

In Fixed View Mode, the Science Data Packet is the same format as Scan Mode, but the concept of Earth, Space and OBCT pixels does not apply. All 98 pixels are for the fixed view position. The (90 + 4 + 4) pixels are however collected with the same timing as though Scan Mode were performed.

Each of the Pixel sub-fields contain a position and five pixel values. The format of a Pixel Subfield is shown in Table 4.1.4.4-14.

<b>Table 4.1.4.4-14. Pixel Subfield Format.</b>							
<b>MSB</b>							<b>LSB</b>
Mid-pixel Position MS Byte							
Mid-pixel Position LS Byte							
Channel H1 Data MS Byte							
Channel H1 Data LS Byte							
Channel H2 Data MS Byte							
Channel H2 Data LS Byte							
Channel H3 Data MS Byte							
Channel H3 Data LS Byte							
Channel H4 Data MS Byte							
Channel H4 Data LS Byte							

Channel H5 Data MS Byte
Channel H5 Data LS Byte

The Mid-pixel position data is the angular position of the Reflector at the mid-point of the pixel integration period defined by.

The OBCT Temperature Data field contains the On-Board Calibration Target high precision temperature parameters. The format of this block is given in Table 4.1.4.4-15.

<b>Table 4.1.4.4-15. OBCT Subfield Format.</b>							
<b>MSB</b>							<b>LSB</b>
Unused				On-Board Target Temperature 1			
On-Board Target Temperature 1 (PRT1)							
Unused				On-Board Target Temperature 2			
On-Board Target Temperature 2 (PRT 2)							
Unused				On-Board Target Temperature 3			
On-Board Target Temperature 3 (PRT 3)							
Unused				On-Board Target Temperature 4			
On-Board Target Temperature 4 (PRT 4)							
Unused				On-Board Target Temperature 5			
On-Board Target Temperature 5 (PRT 5)							
Unused				Calibration Channel 1			
Calibration Channel 1 (PRT CAL 1: 118 Ω)							
Unused				Calibration Channel 2			
Calibration Channel 2 (PRT CAL 2: 95.3 Ω)							
Unused				Calibration Channel 3			
Calibration Channel 3 (PRT CAL 3: 80.6 Ω)							

The full Housekeeping Telemetry Data blocks contain the following fields as shown in Table 4.1.4.4-16.

<b>Table 4.1.4.4-16. Full Housekeeping Telemetry Data Block.</b>	
<b>Field Name</b>	<b>Size (Octets)</b>
Mode and Subcommutation Code	1
Telecommand Acknowledgement and Fault Code	5
Switch Status	3
Temperature Data	24
Raw Current Consumption Data	6

The Sub-Commutation code is not significant for the Science Data packet as all telemetry is returned.

As with other packets, the Mode Code identifies the packet as either a Science Data Packet (Scan and Fixed View Modes), an Extended Test Packet (self-test mode), an Extended Memory Data

Packet (Mode Code = "1111") or an Empty Science Data Packet (all other Modes). Note that the Telecommand Acknowledgement field of Science Data packets provides acknowledgement of commands received on the Science Data Bus. (Commands on the Command/telemetry Bus are acknowledged in HK Telemetry Packets.)

The Temperature Data Field of each packet will contain all twenty-four thermistor telemetry channel parameters, instead of the multiplexed four of the Housekeeping telemetry packet. The OBCT temperatures are not contained here, as all such values are allocated a separate field in the Science Data Bus.

The Raw Current Consumption Data Field is the internal PSU Current analog telemetry as defined in Table 4.1.4.4-17.

Table 4.1.4.4-17. Raw Current Consumption Data Field Format.							
MSB							LSB
+5V Secondary Current							
+8V Receiver Current							
+15V Receiver Current							
-15V Receiver Current							
RDM Motor Current							
FDM Motor Current							

#### 4.1.5 AIP MINOR FRAME FORMATS

The spacecraft's AMSU Instrument Processor (AIP) collects digital data from the AMSU-A and AMSU-B sensors. This data consists of earth view pixel data, housekeeping data and space and blackbody view data.

##### 4.1.5.1 AIP Minor Frame Format for NOAA KLM

Figure 4.1.5.1-1 shows the AIP telemetry word location in the frame format, and Table 4.1.5.1-1 contains AIP telemetry word titles, locations within the frame, and word descriptions in tabular form.

## 4.2 APT SYSTEM

### 4.2.1 GENERAL

The Automatic Picture Transmission (APT) system provides a reduced resolution data stream from the AVHRR/3 instrument. Any two of the AVHRR channels can be chosen by ground command for processing and ultimate output to the APT transmitter. A visible channel is used to provide visible APT imagery during daylight, and one IR channel is used constantly (day and night). A second IR channel can be scheduled to replace the visible channel during the nighttime portion of the orbit. The analog APT signal is transmitted continuously and can be received in real time by relatively unsophisticated, inexpensive ground station equipment (a list of equipment manufacturers is available on the NOAA/SIS Internet site. See Internet resources in Appendix E) while the satellite is within radio range. The characteristics of the transmitted signal remain unchanged in the NOAA KLM and NOAA-N,-N' satellite series from those in the TIROS-N series

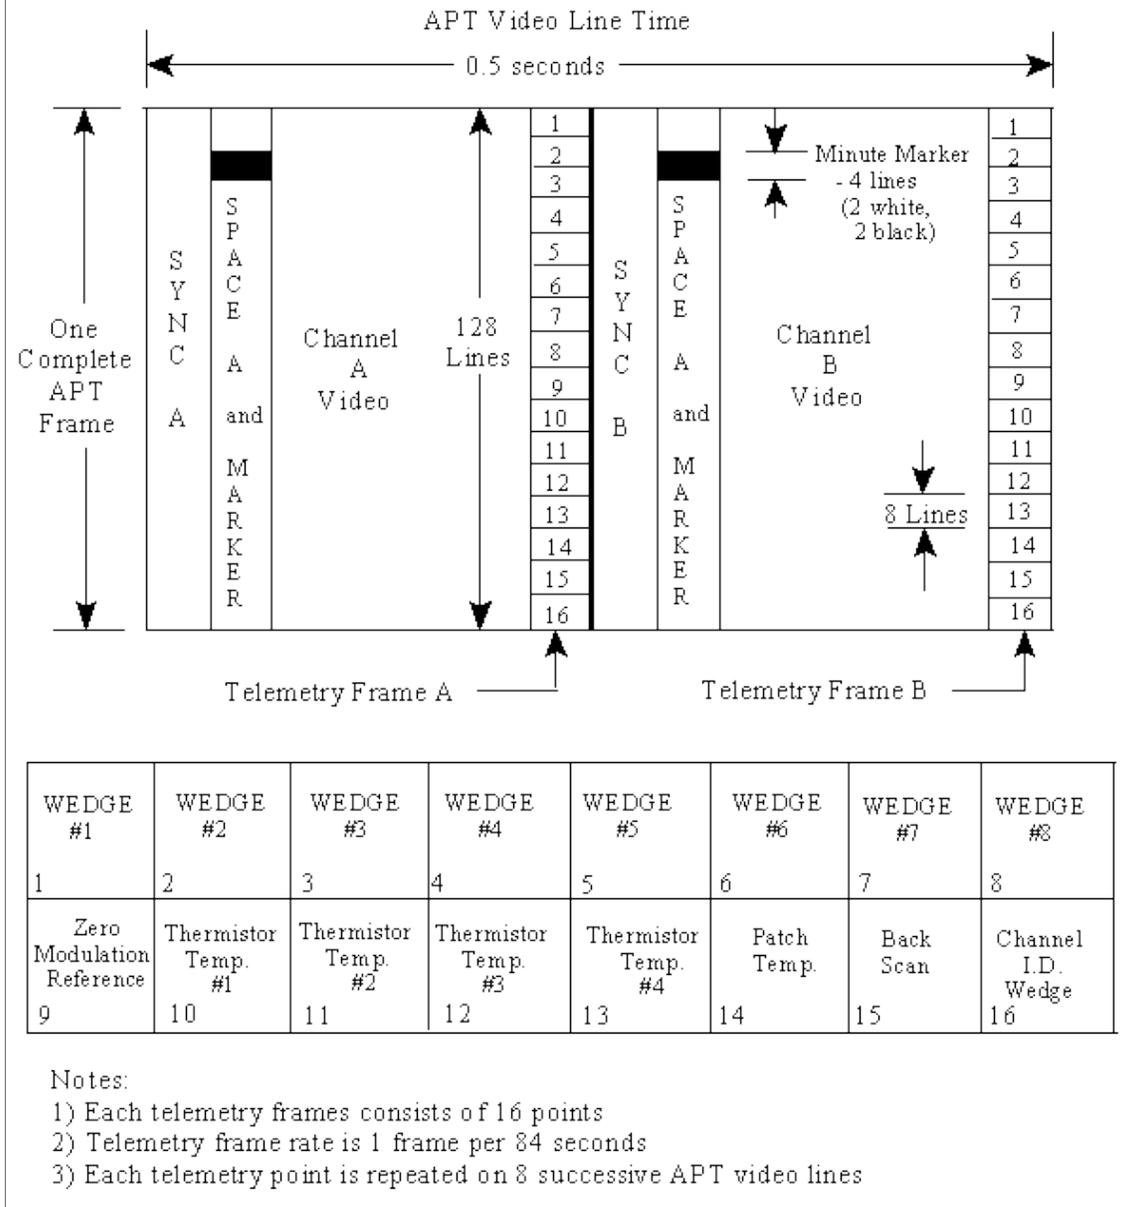

(NOAA-8 through NOAA-14), while there is a minor change in the data format to account for the modified channel 3 on the AVHRR instrument.

#### 4.2.2 APT TRANSMISSION CHARACTERISTICS

The processed AVHRR instrument data AM modulates a 2400 Hz subcarrier. The maximum subcarrier modulation is defined as the amplitude of the gray scale wedge number 8 (see Figure 4.2.2-1), producing a modulation index of 87%  $\pm$  5% (not exceeding 92%). The AM modulated subcarrier is subsequently used to FM modulate the VTX transmitter operating in the 137 - 138 MHz band. Table 4.2.2-1 summarizes the pertinent APT transmission characteristics.

<b>Table 4.2.2-1. APT Transmission Characteristics.</b>	
Line Rate	120 lines/min
Data Channels	2 transmitted 6 available
Data Resolution	4.0 km
Carrier Modulation	2.4 KHz AM subcarrier on FM carrier
Transmitter Frequency (MHz)	137.50 or 137.62
Transmitter Power (EOL)	5 W (37dBm)
Radiated Power (dBm, @ 63 degrees)	36.7
Polarization	RCP

**Figure 4.2.2-1. APT Frame Format.**

**Figure 4.2.2-1. APT Frame Format**

### 4.2.3 APT Data Frame Format

The MIRP processes the AVHRR data and outputs the APT format (simultaneously with the HRPT, LAC and GAC formats). All the processing in the MIRP is done in the digital realm. The digitized AVHRR input consists of 10-bit words. The MIRP inserts calibration and telemetry data for each of the selected APT channels being transmitted, and AM modulates the 2400 Hz subcarrier, corresponding to the light and dark areas seen by the instrument, with the 8 Most Significant Bits (MSB) of the 10-bit data. The formatted data passes through the MIRP digital-to-analog converter, is filtered and modulated onto the 2400 Hz carrier.

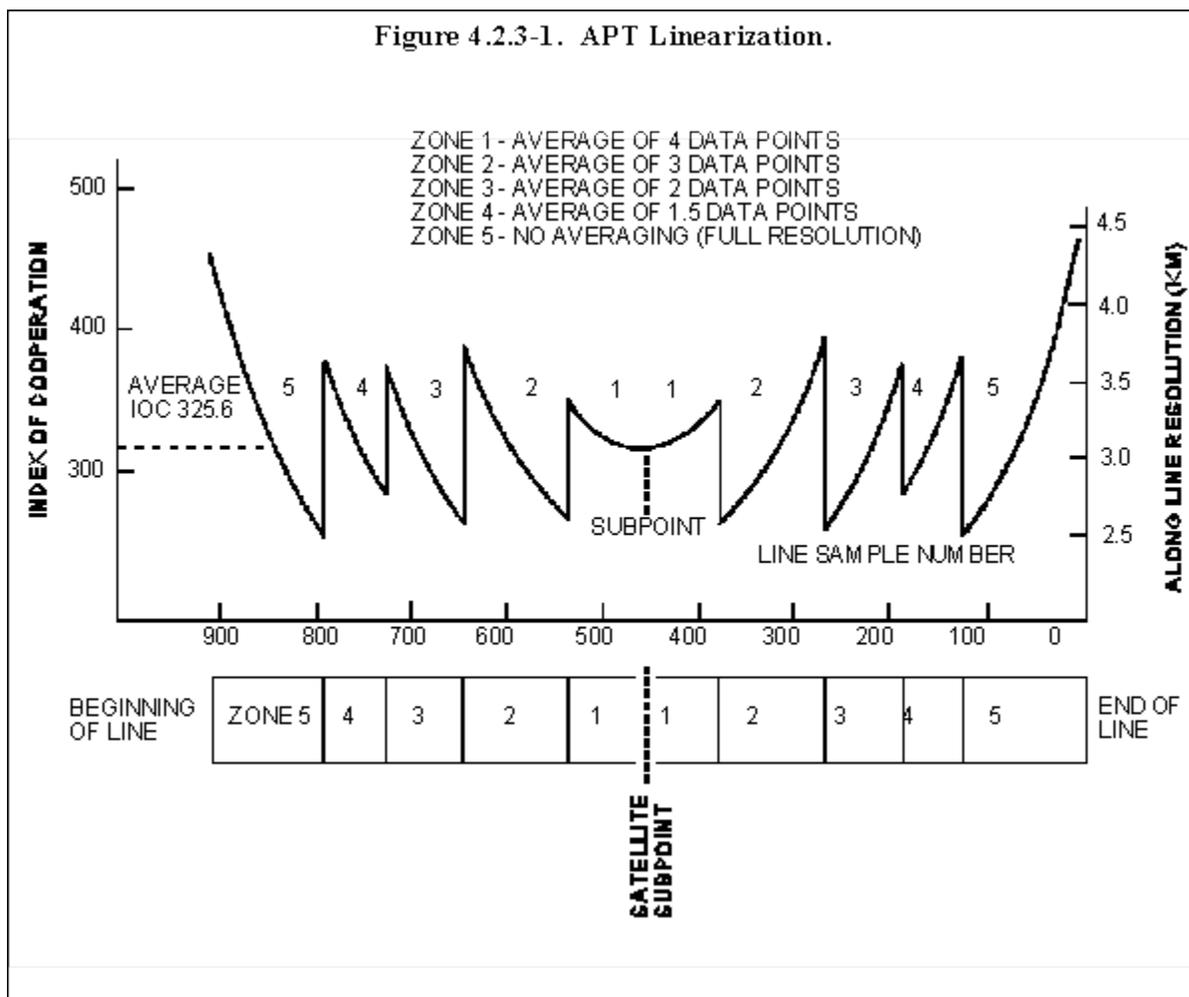

On the NOAA KLM and NOAA-N,N' series, two of the six possible AVHRR spectral channels are multiplexed so that channel A APT data is obtained from one spectral channel of the first AVHRR scan line, and channel B from another spectral channel contained in the second AVHRR scan line. The third AVHRR scan line is omitted from the APT, and the process is repeated. It can be seen that the data processing algorithm is designed so that data from every third line from each of the two selected channels of the original high resolution AVHRR output are formatted for each of the two APT channels. The algorithm also maintains nearly equal geometric resolution of 4 km along the scan line. This is accomplished by using a separate resolution reduction in each of five regions or zones either side of the nadir. The details of this algorithm are shown Table 4.2.3-1 and Figure 4.2.3-1. The two AVHRR channels used are identified in the daily TBUS message, and are further classified by the daytime and nighttime portion of the orbit. Channel identification is also included as part of the telemetry frame.

Table 4.2.3-2 enumerates the APT format parameters. Figures 4.2.2-1, 4.2.3-2 and 4.2.3-3 illustrate the APT frame format, the video line format and signal synchronization details. Examining the frame format shown in Figure 4.2.2-1, it can be seen that both channel A and B have a series of 16 “wedges” used in calibrating the APT image. Each of the wedges is composed of 8 successive video lines. Only the wedges of one frame from an entire, received pass, are needed for calibration. Also note that wedges 1 through 14 are identical on the images from both channels A and B. Only wedges 15 (the back scan value when one of the IR radiometers “looks” at a blackbody radiator) and 16 (channel identification) vary between channel A and B.

The channel identification wedge has changed in the NOAA KLM and NOAA-N,-N' series now that there are six possible channels 1, 2, 3A, 3B, 4 and 5. The modulation index of wedge 16 will equal one of the first six grey scale wedges. Wedge 3 will correspond to channel 3A being in use, while wedge 6 will correspond to channel 3B being in use. All other channel numbers will be the same as the number of the corresponding grey scale wedge.

<b>Table 4.2.3-1 APT Linearization Algorithm</b>			
Zone 1 0-16.98 degrees from nadir	Average 4 contiguous samples	628 AVHRR data samples per channel	157 processed APT words output to D/A converter
Zone 2 16.98-34.83 degrees	Average 3 contiguous samples, skip 1,	330 AVHRR data samples per channel	110 processed APT words output to D/A

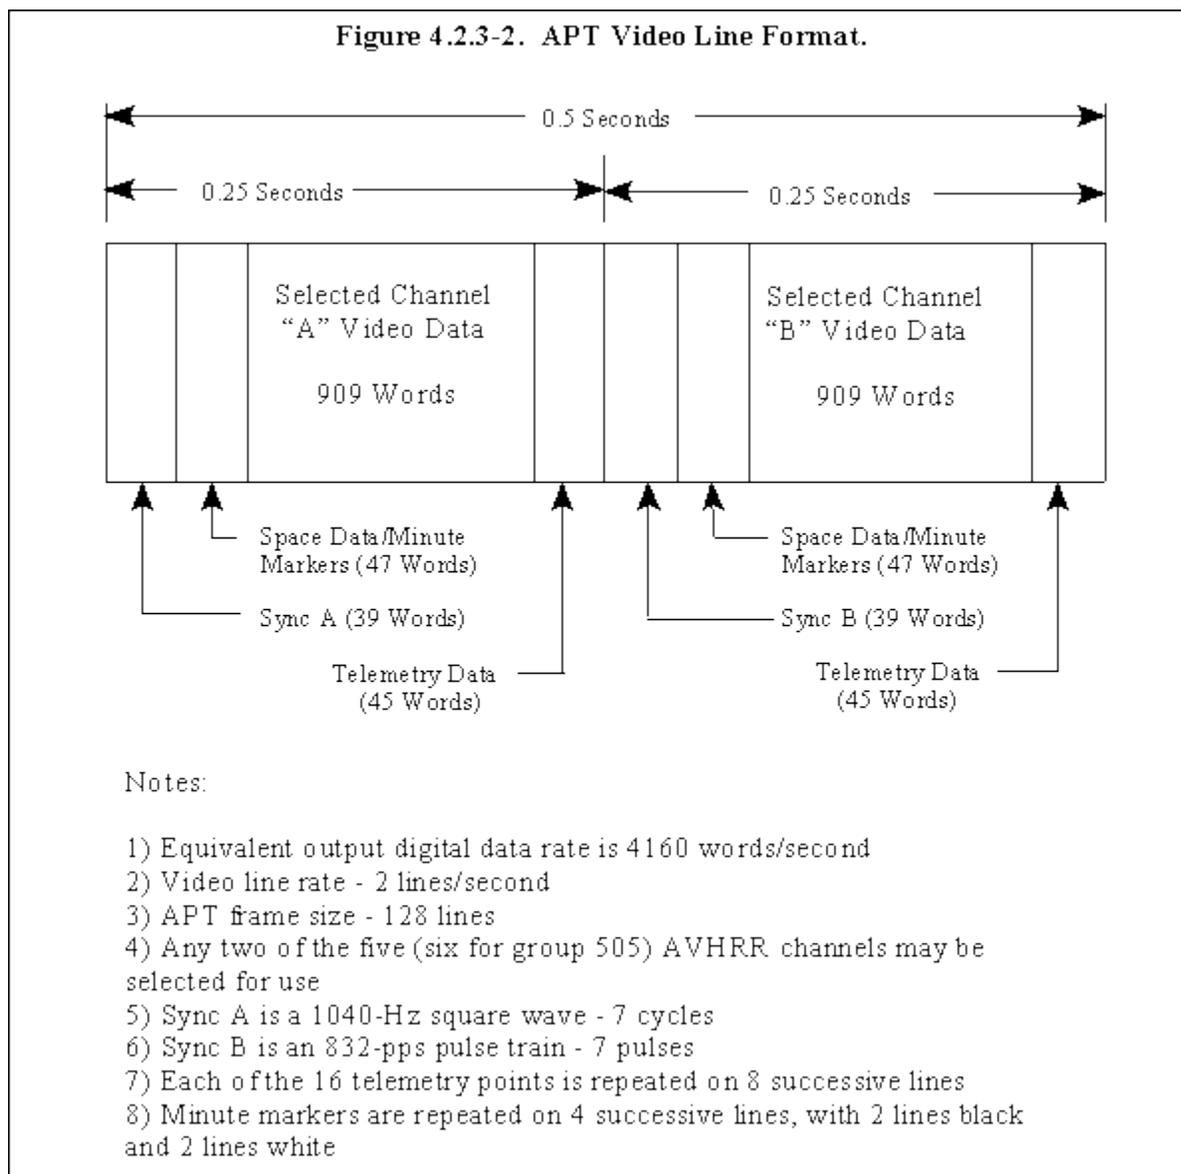

either side of nadir	repeat		converter
Zone 3 34.83-43.83 degrees either side of nadir	Average 2 contiguous samples	166 AVHRR data samples per channel	83 processed APT words to output D/A converter
Zone 4 43.83-48.84 degrees either side of nadir	Average 1.5 samples (A+B/2 and B+C/2)	93 AVHRR data samples per channel	62 processed APT words output to D/A converter
Zone 5 48.84-55.4 degrees either side of nadir	Retain original resolution	121 AVHRR data samples per channel	121 processed APT words output to D/A converter.

### 4.3 DIRECT SOUNDER BROADCAST (DSB)

#### 4.3.1 GENERAL

The Direct Sounder Broadcast (DSB, also referred to as the beacon transmission) contains the low bit rate instrument (HIRS/3, HIRS/4 on NOAA-N, -N', SBUV/2, SEM, and DCS/2, but not AMSU) digital data, identical to that within the HRPT transmission. Data are therefore available in both the VHF and S-band links. Those users receiving the high resolution HRPT transmission would likely find it most desirable to extract the low rate data from this data stream. The VHF beacon transmission is available to users who do not intend to install the more complex equipment necessary to receive high data rate S-band service. The lower data rates permit the user to install less complex, less costly equipment to receive the data without degrading its quality.

#### 4.3.2 DSB Transmission Characteristics

On board the satellite, output from the low data rate instruments is collected and formatted by the TIROS Information Processor (TIP). Parallel outputs are provided for the real-time VHF beacon transmission (DSB) and the MIRP (for the HRPT service). The instrument data is multiplexed with analog and digital housekeeping data. The TIP output directly modulates the beacon transmission. The data is transmitted as an 8.32 Kbps split phase signal (similar to the HRPT

transmission, above) over one of the beacon transmitters (BTX). Detailed transmission characteristics and TIP parameters are shown in Tables 4.3.2-1 and 4.3.2-2.

<b>Table 4.3.2-1 DSB Transmission Characteristics</b>	
Carrier Modulation	Digital split phase, phase modulated
Transmitter Frequency (Mhz)	137.35 or 137.77
Transmitter Power (EOL)	1.0 watts (30dBm)
Radiated Power (dBm)	.5 (over 90% of sphere)
Polarization	RCP

### 4.3.3 TIP FRAME FORMAT

The TIP format is based on a major frame which contains 320 minor frames.

4.3.3.1 TIP Minor Frame Format for NOAA-KLM

About one-quarter of the 104 telemetry word locations in the TIP minor frame have been changed for NOAA KLM. This is due to the removal of the Stratospheric Sounding Unit (SSU) and Earth Radiation Budget Experiment (ERBE) from the new series of spacecraft. Word locations previously assigned to the SSU have been allocated to the HIRS/3 and Data Collection System (DCS). The ERBE word locations have been reassigned to DCS, as well. In addition, two words have been allocated to the Decryption Authentication Unit (DAU). Table 4.3.3.1-1 shows the TIP telemetry word location in the frame format. Table 4.3.3.1-2 contains telemetry word titles, locations within the frame, and word descriptions in tabular form

<b>Table 4.3.3.1-1. TIP Minor Frame Format for NOAA KLM.</b>

		5	100111111-Minor frame 319
Command Verification	2	6	Bits 9 thru 24 of each valid received or stored command word are placed in the 16 bit slots of telemetry words 6 and 7 on a one-for-one basis.
		7	
Time Code	5	8,9	9 bits of binary Cay Count, MSB first
		9	Bits 2-5: 0101, Spare Bits
		9,10	27 bits of Binary millisec of Day Count, MSB first
		11	Time code is inserted on word location 8-12 only in minor frame 0 of every major frame. The data inserted is referenced to the beginning of the first bit or the minor frame sync word of minor frame 0 within ∇ millisecond.
		12	
Digital "B" Subcom-1	1	8	A Subcommutation of Discrete Inputs collected to form 8 bit words. 256 Discrete Inputs (32 words) can be accommodated. It takes 32 frames to sample all inputs once (sampling rate=once/3.2 sec). A Major Frame contains 10 complete Digital "B" subcommutated frames.
Analog Subcom (32 sec)	1	9	A subcommutation of up to 191 analog points sampled once every 32 seconds plus 64 analog points sampled twice every 32 seconds (once every 16 seconds). Bit 1 of each word represents 2560 mV, while Bit 8 represents 20 mV.

Analog Subcom (16 sec)	1	10	This subcommutation is controlled by a PROM located in the TIP and contains 160 word locations with 128 analog channels sampled once every 16 seconds.
Analog Subcom (1 sec)	1	11	This subcommutation is controlled by a PROM in the TIP and contains 10 analog channels sampled once every 1 second. Word 0 of this subcom is filled with data from an analog point selected by command. The selected analog point may be one of the 512 analog points available to the TIP. Bit 0 of each word represents 2560 mV while Bit 8 represents 20 mV.
Digital "B" Subcom-2	1	12	The subcommutation of discrete inputs collected to form 8 Bit words. 256 discrete inputs (32 words) can be accommodated. It takes 32 minor frames to sample all inputs once (sampling rate=once/3.2 sec). A Major Frame contains 10 complete Digital "B" subcommutated frames.  64 of these bit locations corresponding to TIP minor frames 24-31 form the XSU Digital "A" data. The XSU generates an 8 word subcom which is read out at the rate of one word per minor frame. The XSU subcom is synchronized with its word 1 in minor frame 24.
Analog Subcom- 2 (16 sec)	1	13	This subcommutation is controlled by a PROM located in the TIP and contains 160 words locations with 128 analog channels sampled once every 16 seconds.  The remaining 32 word locations contain data from the Solar Array Telemetry Commutator Unit (SATCU). The SATCU receives inputs from 16 sources on the solar array, commutates them and presents this stream and presents it in the last 32 word locations. The 32 words represent two successive passes through the SATCU subcom.
DAU-1	1	14	8 Bit Housekeeping Telemetry words are formed by the DAU-1 and read out by the telemetry system at an average of 10 words per second.
DAU-2	1	15	8 Bit Housekeeping Telemetry words are formed by the DAU-2 and read out by the telemetry system at an average of 10 words per second.

HIRS/3	36	16,17, 22,23, 26,27, 30,31, 34,35, 38,39, 42,43, 54,55, 58,59, 62,63, 66,67, 70,71, 74,75, 78,79, 82,83, 84,85, 88,89, 92,93	8 Bit words are formed by the HIRS/3 experiment and are read out by the telemetry system at an average rate of 360 words per second.
SEM	2	20,21	8 Bit words are formed by the SEM sensor and ready out by the telemetry system at an average rate of 20 words per second.
DCS-2	32	18,19, 24,25, 28,29, 32,33, 40,41, 44,45, 52,53, 56,57, 60,61, 64,65, 68,69, 72,73, 76,77, 86,87, 90,91, 94,95	8 Bit words are formed by the DCS experiment and are read out by the telemetry system at an average rate of 320 words per second
SBUV/2	4	36,37, 80,81	8 Bit words are formed by the SBUV/2 experiment and read out by the telemetry system at an average rate of 40 words per second.
CPU A Telemetry	6	46,47, 48,49, 50,51	A second block of 16 Bit CPU words is ready out by the telemetry system every minor frame.

CPU B Telemetry	6	96,97, 98,99, 100,101	A second block of 16 Bit CPU words is ready out by the telemetry system every minor frame.
CPU Data Status	1-	103	Bits 1 And 2: 00=All CPU data received 01=All CPU A data received; CPU B data incomplete 10= All CPU B data received; CPU A data incomplete 11=CPU A and CPU B data incomplete
Parity	1-	103	Bit 3: Even parity check in words 2 through 18 Bit 4: Even parity check in words 19 thru 35 Bit 5: Even parity check in words 36 thru 52 Bit 6: Even parity check in words 53 thru 69 Bit 7: Even parity check in words 70 thru 86 Bit 8: Even parity check in words 87 thru bit 7 of word 103

4.3.3.2 TIP Minor Frame Format for NOAA-N, -N'

For NOAA-N, -N', Table 4.3.3.2-1 shows the TIP telemetry word location in the frame format. Table 4.3.3.2-2 shows the TIP telemetry word location in the frame format. Other than HIRS/4 data in place of HIRS/3 data, the only real difference between a NOAA KLM TIP minor frame and a NOAA-N, -N' TIP minor frame is byte 102, which contains MIU data.

<b>Table 4.3.3.2-1. TIP Minor Frame Format for NOAA-N, N'.</b>

#### 4.3.4 Digital "A" Telemetry

##### 4.3.4.1 HIRS

##### 4.3.4.1.1 HIRS/3

The data from the HIRS/3 are provided to the TIP system from a storage register. The TIP clock pulse ( $C_1$ ) and Data Select pulses determine the time at which data are called out. The TIP formatter calls out groups of 8-bit words in a sequence that multiplexes HIRS/3 data with that of other instruments. Because of the large quantity of HIRS/3 data to be transmitted and the use of 13-bit decoding of radiometric data, it was not possible to format the HIRS/3 data into neat 8-bit segments. The HIRS/3 data are therefore provided as a continuous stream with 13-bit word lengths. During any minor frame, there are 288 bits of data; each bit is identified as to its purpose.

A full set of HIRS/3 operational data, including command status monitors, housekeeping information and radiance data of the 20 channels, is contained in the Digital "A" output. The HIRS/3 data repeats every 6.4 seconds as described below. The 6.4 second period contains 64 elements.

##### 1) Element Definition

Digital A output is divided into "elements" of 288 bits. An element is phased to fit into a TIP minor frame as described above.

##### 2) Element Formats

Sixty-four elements make up each scan. The formats for the elements repeat every 6.4 seconds and correspond to the particular parts of the scan. Element numbers 0-55 are Earth scan data. Scan element 0 describes the data at the time of viewing the first Earth scan position. Scan element 55 designates the last Earth scan position. Scan elements 56-63 occur during retrace during normal Earth scanning. The same element number designations continue when the scan is commanded to a calibration target. Normally the mirror motion to the warm calibration target takes place during the normal retrace interval. In the case of slew to the space look position, the motion occurs during scan elements 0 to 7.

Data reduction must take this into account as required. The elements are divided as follows:

##### (a) Bits 1-26

Two 13 bit words have the same function in all 64 elements. The function assembled in these words are as follows:

<u>Word 1</u>	<u>Function</u>	<u>Range (Decimal)</u>
1 - 8	Scan Encoder Position	0 to 199
9 - 13	Electronic Cal Level Indicator	0 to 331

<u>Word 2</u>	<u>Function</u>	<u>Range (Decimal)</u>
1 - 6	Channel 1 Period Monitor	0 to 63
7 - 12	Element Number	0 to 63
13	Filter Sync Designator	n/a

(b) Bits 27-286

This group of bits is divided into 20 13-bit words (20 Ch x 13 Bits). For elements 0-55, these are the Radiant Signal Output. The word functions are dependent on element number. Except for the two status words in element 63, all words are quantity where bit 1 is the sign bit and bits 2 through 13 are amplitude (0 to 4095). Bit 2 is the most significant bit (MSB) and bit 13 is the least significant bit (LSB) of the quantity. The sign bit is:

logic "1"	+ (positive)
logic "0"	- (negative)

The HIRS/3 instrument serial number is preset for each instrument in element 63, bits 42-44. The protoflight has the designation 001; the flight models will be designated 002 on up.

(c) Bits 287 & 288

In the same manner as for bits 1 through 26, these two bits have the same function in all 64 elements. In order to aid determination of times when data should not be used, we have included a Valid Data Bit into the data stream. This bit is a "1" when all conditions are normal and data may be considered good. It will be a "0" when the scan system is in a slew mode or when the filter wheel is not synchronized to the timing system.

Bit 287 Valid Data Bit

logic "1"	Valid Data
logic "0"	Ignore Radiometric Data

Minor Word Parity Check is a bit inserted to make the total word odd. This permits automatic checking for data losses in the transmission of the data from the HIRS/3.

Bit 288 Odd bit parity

3) Function Descriptions

Scan Encoder Position - Encoder position is the sensed position of the scan mirror in 1.8 degree increments. The scan positions are described later, but it may be noted that encoder position "1" occurs at the first Earth scan position, hence will be the encoder position noted during element "0".

Electronic Cal Level Indicator - Electronic calibration level advances from 0 to 31, defining the step level measured in each radiometric channel during elements 56 and 57. Since both a positive and negative calibration is made at the end of each scan line, the level applies to both. The step level starts at 0 on the first scan after a calibration start pulse and continues repetitively after that and even when calibration is disabled.

Channel 1 Period Monitor - Measures the variation in time interval of a segment of the filter wheel on each rotation. The reading measures 1.248 MHZ clock intervals of that segment; hence, it defines velocity variations to a granularity of 0.8 microseconds. This is a diagnostic output and is not used in system data processing or evaluation.

Element Number - The number of this data group. It advances from 0 to 63 with element 0 related to the first Earth scan position. The element number repeats regardless of scan position or mode.

Filter Sync Designator - Filter Sync is a "1" when the filter wheel is in synchronism with the timing system. This is diagnostic data not normally used in data collection or processing.

**Table 4.3.4.1.1-1 Digital "A" Status Telemetry**

Element Number	Bit Number	Function	Remarks
0-55	27-39	Radiometric Channel No.1 (669 cm <sup>-1</sup> )	0 counts radiance from scene equal radiance from filter wheel (FW). Plus (+) values are warmer than FW.
	40-52	Radiometric Channel No.17 (2360 cm <sup>-1</sup> )	0 counts offset from FW radiance. Plus and minus are warmer and cooler than offset.
	53-65	Radiometric Channel No. 2 (680 cm <sup>-1</sup> )	No offset.
	66-78	Radiometric Channel No. 3 (690 cm <sup>-1</sup> )	No offset.
	79-91	Radiometric Channel No.13 (2190 cm <sup>-1</sup> )	Offset.
	92-104	Radiometric Channel No.4 (703 cm <sup>-1</sup> )	No offset.
	105-117	Radiometric Channel No.18 (2515 cm <sup>-1</sup> )	Offset.
	118-130	Radiometric Channel No.11 (1365 cm <sup>-1</sup> )	No offset.

	131-145	Radiometric Channel No.19 (2660 cm <sup>-1</sup> )	Offset.
	146-156	Radiometric Channel No. 7 (749 cm <sup>-1</sup> )	No offset.
	157-169	Radiometric Channel No. 8 (900 cm <sup>-1</sup> )	No offset.
	170-182	Radiometric Channel No.20 (14,500 cm <sup>-1</sup> )	Black is minus. White is plus.
	183-195	Radiometric Channel No.10(1225 cm <sup>-1</sup> )	No offset.
	196-208	Radiometric Channel No.14 (2210 cm <sup>-1</sup> )	Offset.
	209-221	Radiometric Channel No.6 (733 cm <sup>-1</sup> )	No offset.
	222-234	Radiometric Channel No.5 (716 cm <sup>-1</sup> )	No offset.
	235-247	Radiometric Channel No.15 (2240 cm <sup>-1</sup> )	Offset.
	248-260	Radiometric Channel No.12(1488cm <sup>-1</sup> )	No offset.
	261-273	Radiometric Channel No.16 (2270 cm <sup>-1</sup> )	Offset.
	274-286	Radiometric Channel No.9 (1030 cm <sup>-1</sup> )	Offset
56	27-286	Positive Electronics Calibration. Applied to 20 radiometric channels.	Calibration level advances one of the 32 equal level steps on successive scans. The offset and gain of each channel will influence the amplitude of the signal. The calibration level applied to the electronics channels is indicated
57	27-286	Negative Electronics Calibration Applied to 20 radiometric channels	n/a
58	27-91	Internal Warm Target Temperature Sensor #1	Value repeated 5 times. Range 273 to 333 K.
	92-156	Temperature Sensor #2	Value repeated 5 times. Range 273 to 333 K.
	157-221	Temperature Sensor #3	Value repeated 5 times. Range 273 to 333 K.
	222-286	Temperature Sensor #4	Value repeated 5 times. Range 273 to 333 K.
59	27-91	Internal Cold Target Temperature Sensor #1	n/a
	92-156	Internal Cold Target Temperature Sensor #2	n/a
	157-221	Internal Cold Target Temperature Sensor #3	n/a
	222-286	Internal Cold Target Temperature Sensor #4	n/a
60	27-90	Filter Wheel Housing Temperature Sensor #1	Value repeated 5 times. Range 273 to 333 K.
	92-156	Temperature Sensor #1	Value repeated 5 times. Range 273 to 333 K.
	157-221	Temperature Sensor #1	Value repeated 5 times. Range 273 to 333 K.
	222-286	Temperature Sensor #1	Value repeated 5 times. Range

			273 to 333 K.
61	27-90	Patch Temperature Expanded Scale	Value repeated 5 times. Range 90 to 150 K.
	92-156	First Stage Radiator Temperature Sensor	Value repeated 5 times. Range 150 to 320 K.
	157-221	Filter Wheel Housing Current	Value repeated 5 times. Range 0 to 500 mA,
	222-286	Electronic Calibration Digital to Analog	Value repeated 5 times. Range volts 0 to 4 V.
62	27-39	Scan Mirror Temperature	Range 260 to 320 K.
	40-52	Primary Telescope Temperature	Range 260 to 320 K.
	53-65	Secondary Telescope Temperature	Range 260 to 320 K.
	66-78	HIRS/3 Baseplate Temperature	Range 260 to 320 K.
	79-91	HIRS/3 Electronics Temperature	Range 260 to 320 K.
	92-104	Patch Temperature-Full Range	Range 90 to 320 K.
	105-117	Scan Motor Temperature	Range 260 to 320 K.
	118-130	Filter Wheel Motor Temperature	Range 260 to 320 K.
	131-143	Cooler Housing Temperature	Range 260 to 320 K.
	144-156	Patch Control Power	Range 0 to 80 mW
	157-169	Scan Motor Current	Range 0.65 to 1.0 mA
	170-182	Filter Motor Current	Range 100 to 300 mA
	183-195	+15 Vdc	Range 15 ± 0.2 V
	196-208	-15 Vdc	Range -15 ± 0.2 V
	209-221	+7.5 Vdc	Range 7.5 ± 0.05 V
	222-234	-7.5 Vdc	Range -7.5 ± 0.02 V
	235-247	+10 Vdc	Range 10 ± 0.2 V
	248-260	+5 Vdc	Range 5 ± 0.2 V
261-273	Analog Ground	Range ± 1 count	
274-286	Analog Ground	Range ± 1 count	
63	27-39	Line Counter (gives the number of lines from the last auto calibration sequence)	0 to 8191 (There is no sign bit used in the line counter). Reset to 0 count is only when counter overflows.
	40-52	First Status Word	First 5 bits are instrument serial number (no sign bit). The remaining bits indicate status as shown in Table 4.3.4.1.1-2.
	53-65	Second Status Word	First 5 bits are zero filled. The remaining bits indicate status as shown in Table 4.3.1.1-2.
	66-78	Data Verification Binary Code	Binary code is: (1,1,1,1,1,0,0,1,0,0,0,1,1) Equivalent to Base 10 value +3,875

79-91	Base 10 value +1,443
92-104	Base 10 value -1,522
105-117	Base 10 value -1,882
118-130	Base 10 value -1,631
131-143	Base 10 value -1,141
144-156	Base 10 value 1,125
157-169	Base 10 value 3,655
170-182	Base 10 value -2,886
183-195	Base 10 value -3,044
196-208	Base 10 value -3,764
209-221	Base 10 value -3,262
222-234	Base 10 value -2,283
235-247	Base 10 value -2,251
248-260	Base 10 value 3,214
261-273	Base 10 value 1,676
274-286	Base 10 value 1,992

4) Digital “A” Status Telemetry

The last element of each scan, element 63, contains two status words. Bits 45-52 and 58-65 of element 63 are command status bits. Logic state definition is shown in Table 4.3.4.1-2.

<b>Table 4.3.4.1.1-2. Digital “A” Status Telemetry (Element 63, Status Words).</b>		
<b>Bit Number</b>	<b>Function</b>	<b>Remarks</b>
<b>First Status Word</b>		
45	Instrument ON/OFF	ON = 1
46	Scan Motor ON/OFF	ON = 0
47	Filter Wheel ON/OFF	ON = 0
48	Electronics ON/OFF	ON = 1
49	Cooler Heat ON/OFF	ON = 0
50	Internal Warm Target Position	True = 0
51	Internal Cold Target Position	True = 0
52	Space Position	True = 0
<b>Second Status Word</b>		
58	Nadir Position	True = 0
59	Calibration Enable/Disable	Enabled = 0
60	Cooler Door Release Enable/Disable	Enabled = 0
61	Cooler Door Open	YES = 1
62	Cooler Door Closed	YES = 1
63	Filter Housing Heat ON/OFF	ON = 0
64	Patch Temperature Control ON/OFF	ON = 0
65	Filter Motor Power High	Normal = 1

#### 4.3.4.1.2 HIRS/4

Digital “A” data from the instrument is described in Table 4.3.4.1.2-1. The TIP clock pulse ( $C_1$ ) and Data enable pulses determine the time at which the data is called out. The TIP formatter calls out groups of 8-bit words in a sequence that multiplexes HIRS/4 data with that of other instruments on the NOAA-N, -N’ spacecraft. Along with this requirement, the large quantity of instrument data to be transmitted and the use of 13-bit encoding of radiometric data, it was not possible to format the data into 8-bit segments. The HIRS/4 data is therefore provided as a continuous stream composed of 13-bit word lengths but clocked out in 8-bit words by the TIP. During any Minor Frame there are 288 bits of HIRS data which are extracted at an equivalent 8,320 bps rate.

The data format remains the same during the 56 earth scan element time periods. During retrace, which is an interval of eight earth scan element time periods, the data format is changed to provide for measurement of the internal electronic calibration and to sample all of the Housekeeping telemetry data.

Scan Element 0 contains the data which describes the scene at the time of viewing the first scan position. The scan positions are described later, but it should be noted that encoder position “1” occurs at the first earth scan position and hence will encoder position noted during element “0”. Scan element 55 designates the last scan position. Scan Elements 56-63 occur during the scan mirror retrace during normal earth scanning. These same element number designations apply also when the scan is commanded to a calibration target during the Auto Calibration (Autocal) sequence. Normally the mirror slewing motion between calibration targets takes place during the normal retrace interval except for the case of slew to the space look position where the motion occurs during scan elements 0 to 7. Therefore, space look during Autocal is only for 48 elements (8 through 55).

IN order to determine when radiometric data should not be used, a Valid Data bit is included in the data stream. This bit is a “1” when all conditions are normal and the radiometric data may be considered good. It will be a “0” when the scan system is in a slew mode.

The electronic calibration level advances on level per scan line from 0 to 31, defining the step level measured in each radiometric channel during elements 56 and 57. Since both a positive and negative calibration is made during a scan line, the same level value applies for both.

The Channel 1 Period Monitor measures the time interval of the travel from the Channel 1 to the Channel 2 segments of the filter wheel on each rotation. The reading measures 1,248 MHz clock intervals during that segment, hence defines filter rotation time with a resolution of 0.8 microseconds. This is not used in normal system data processing or evaluation but is a powerful diagnostic tool to aid in assessing the filter wheel subsystem health.

With every filter wheel revolution, a block of data is generated. This block, called an element is 288 bits long. A scan line consists of 56 scene views and eight retrace elements. Thus, there are 64 (56 + 8) filter wheel revolutions per line and 64 elements per scan line. Each element is numbered 0 to 63 and this 6-bit binary number is included in each element at bit location 20-25.

Filter Sync Designator is a “1” when the filter wheel is in synchronized with the data control timing system. This is diagnostic data not normally used in data collection or processing. If the Filter Sync Designator is “0” the radiometric data is not valid.

Radiant Signal Output is the 13-bit binary level measurement of the signals coming from the various detectors. The first bit is a sign bit (“1” positive, “0” is negative). The remaining twelve data bits are straight binary code in order from the most significant to least significant bit.

Mirror Word Parity Check is the last bit of each Minor Frame or data element and is inserted to make the total number of “ones” in that data element odd. This permits checking for loss of data integrity between transmission from the instrument and the reconstruction on the ground. Elements 58-61 contain the outputs of the temperature and the ECAL DAC, sampled five times during each element. This approach provides a more accurate measurement of the more critical sensor temperatures.

In element 62, the data multiplexer connects other voltage and temperature sensors outputs into the A/D converter for one sample each, thereby allowing monitoring of all the major test points in the system.

Element 63 contains the command status, the instrument serial number, the total line number since the last radiometric calibration (in 13-bit natural binary), and a fixed word pattern and fill bits.

The Instrument Serial Number is unique for each instrument. The HIRS/4 instruments will be designated as 015, 016, 017 and 018.

Command Status is a tabulation of the state of the command relays.

Table 4.3.4.2-1 shows the HIRS/4 Digital “A” output. The only content difference between HIRS/3 data and HIRS/4 data is in element 59.

**Table 4.3.4.1.2-1 HIRS/4 Digital “A” Data Output Format.**

<b>Element #</b>	<b>Bit #</b>	<b>Description</b>	<b>Range Counts</b>	<b>Notes</b>
0-55 (Earth Scan Elements)	1-8	Encoder Position	0 to 200

**Notes:**

1. Command Status Bits
2. Fixed word pattern used to establish data stream synchronization with TIP.

4.3.4.2 SEM-2

SEM-2 data accumulation and transfer are synchronized to the spacecraft's 32 second Major Frame. The Major Frame consists of 320 0.1 second Minor Frames, and SEM-2 is assigned two Digital A data words (20 and 21) per Minor Frame.

The Digital A telemetry format is shown in Table 4.3.4.2-1 which identifies the data assignments for each of the two SEM data words in the 320 Minor Frames constituting one Major Frame.

MEPED Digital A data consists of six directional proton measurements and three directional electron measurements for each of two directions of incidence (0 and 90 degrees) and four omnidirectional proton measurements. All but the two highest energy omnidirectional proton measurements are read out every two seconds. The two highest energy omnidirectional proton measurements are read out every four seconds. The MEPED Digital A data and readout rates are summarized in Table 4.3.4.2-2.

TED Digital A data consists of a 0.05 to 1 keV partial energy flux measurement, a 1 to 20 keV partial energy flux measurement, maximum differential energy fluxes, four-point differential energy spectra and background measurements for electrons and protons, each at two angles of incidence (0 and 30 degrees). The TED Digital A output data and readout rates are summarized in Table 4.3.4.2-3. Note that the four differential energy flux maximum channel identifiers (OEM, OPM, 3EM and 3PM) are each four bits long (each identifies 1 of 16 channels) and are combined into two 8 bit words (OEM/OPM and 3EM/3PM). Note also that two (0 and 30 degrees) proton four-point differential energy spectra are read out only three times every 32 seconds, while the two (0 and 30 degrees) electron four-point differential energy spectra are read out four times every 32 seconds (every 8 seconds). Sensor background data and synchronization words are read out in place of the fourth proton four-point differential energy spectral data.

Background	32	0EBKH,0EBKL,0PBKH,0PBKL	
<b>Notes:</b>			
1. Four sets of measurements are made: electrons at 0 degrees, protons at 0 degrees, electrons at 90 degrees and protons at 90 degrees.			
2. Four bits each, combined into two data words (0EM/0PM and 3EM/3PM).			
3. Differential energy channels 4, 8, 11 and 14 (based on 1-16).			
4. The four-point proton spectra are read three times every 32 seconds.			

#### 4.3.4.3 SBUV/2

Digital "A" data is clocked into the spacecraft TIP whenever the "A<sub>1</sub>" Data Enable Pulse is presented to the instrument. Digital "A" data include both instrument data and any housekeeping telemetry required for reduction of observation data. The data format differs with the various SBUV/2 operating modes as described below.

##### 4.3.4.3.1 Discrete Mode

The instrument views the earth's atmosphere or the sun if the diffuser is so deployed. In this mode, radiometric data is taken at twelve discrete wavelengths. The data format for this mode is shown in Table 4.3.4.3.1-1. Further details of the data format are provided in Tables 4.3.4.3.1-2, 4.3.4.3.1-3, 4.3.4.3.1-4, 4.3.4.3.1-5 and 4.3.4.3.1-6.

##### 4.3.4.3.2 Sweep Mode

The instrument grating sweeps from approximately 400 nm to 160 nm, and data is taken in 0.15 nm increments. If SBUV/2 is viewing the earth, the scene spectral radiance is being measured. If the diffuser is deployed, the instrument is measuring the solar irradiance.

##### 4.3.4.3.3 Wavelength Calibration Mode

The instrument views an on-board Hg lamp source at 12 discrete grating positions bracketing a particular source line. The data format for this mode is the same as that for the Discrete Mode, as shown in Table 4.3.4.3.1-1.

**Notes:**

- 1) Include discrete, calibration and position modes.
- 2) Format is the same for all major frames.
- 3) The basic SBUV/2 data frame is a 20-block repeating a one second intervals.
- 4) Word 1 corresponds to the 16 bits in TIP words 36 and 37, MSB sent first. Word 2 corresponds to the 16 bits in TIP words 80 and 81, MSB sent first.
- 5) Analog sub-mux is 16 channels deep.
- 6) Radiometric DC level/grating position error.
- 7) Channel N is the present 1 second time interval. Channel N-1 is the previous 1 second time interval.
- 8) In every two second interval, signal integration occurs between ¾ and 2 sec; signal is sampled and readout at the end of 1 sec and two sec.

#### 4.4 DATA COLLECTION AND LOCATION SYSTEM

##### 4.4.1 GENERAL

The Data Collection System (DCS) on the NOAA KLM spacecraft is provided by CNES of France. This system provides a means to collect data and/or locate fixed and mobile buoy and balloon platforms. A complete description of the system is contained in Section 3.6.

If the data platforms and receive site are simultaneously in the view of the satellite, the Data Collection System provides the immediate rebroadcast of data from the platform, received by the satellite via an UHF uplink. These data are included as 32 8-bit words in the TIP minor frame. As such, it is available in both the low data rate DSB and high data rate HRPT services. Since the data rate on the new DCS/2 instrument has been increased from 1200 to 2560 bps, the number of TIP words allocated to DCS has been increased to 32 from the previous spacecraft series. However, interpretation of the telemetry remains unchanged. The DCS data in the direct broadcast services will only permit platform location computations with the proper computer software. More details can be obtained from Service ARGOS, as noted in Appendix E.

## **5.0 TRACKING PROCEDURES FOR DIRECTIONAL ANTENNAS USED TO ACQUIRE DATA FROM REAL TIME TRANS-MISSIONS SYSTEM SENSORS**

All operators of satellite stations designed to receive any type of direct readout transmission from polar orbiting satellites need to know the satellite's position in time and space in order to know when to operate their equipment and to permit them to geographically locate the received data. Operators of stations using directional antennas also need this information to determine antenna pointing angles, although this is not required of stations using fixed, omnidirectional antennas.

One of the primary sources of information concerning a satellite's position in time and space is the TBUS predict bulletin. These bulletins are issued daily for all NOAA satellites, both polar orbiting and geostationary. The information in the bulletin can be used in a variety of computer programs (or hand plotted, using graphical techniques) to determine the antenna azimuth and elevation angles necessary to follow a polar orbiting satellite passing within receiving range of a given station. In advanced satellite receiving systems, the output can provide commands to directly drive the antenna aiming hardware. The content and primary sources of the TBUS bulletin are described in Sections 5.1 and 5.2. Alternate sources and forms of satellite prediction information are identified in Section 5.2.

The code form of the TBUS bulletin, an example of an actual bulletin, and a decoding exercise are given in Appendix A.

### **5.1 TBUS BULLETIN**

The TBUS bulletin contains information on satellite equator crossing times and longitudes, orbit numbers, orbital period, longitudinal time, and longitudinal increments between successive orbits; also, satellite positions at two-minute intervals (for a reference orbit), transmission frequencies, and other information related to satellite tracking and performance. The orbital information is valid for the third day **after** the date on which the bulletin is prepared and transmitted.

The bulletins are prepared by NESDIS and transmitted through the National Weather Service Telecommunications Gateway (KWBC) to major meteorological centers and relay points around the world, which comprise the Global Telecommunications Service (GTS). The GTS primarily serves the international meteorological community. However, the TBUS bulletin receives further distribution via the Internet, electronic mail, high frequency radio broadcasts and commercial data services.

There are two forms of the TBUS bulletin. One form, identified as TBUS-1, is used to convey information about satellites that are descending in daylight (traveling north-to-south on the sunlit portion of the orbit). The second form, TBUS-2, provides data for satellites that are ascending in daylight (northbound on the sunlit portion of the orbit).

A schematic representation of the TBUS-1 and TBUS-2 bulletins is shown in Figure 5.1-1.

Both bulletins consist of four parts. Part 1 is quite short. It identifies a reference orbit on a given day (three days after the date of the bulletin) and gives the equator crossing time and longitude for this reference orbit. This is followed by an orbital nodal period and a longitudinal increment—the separation between successive equator crossings, measured in degrees. The orbit number of the fourth and eighth orbits following the reference orbit are then listed along with the equator crossing times and longitude of these orbits.

By itself, Part 1 contains sufficient information to permit the user to calculate future equator crossing times and longitudes several days in advance with considerable accuracy. During periods of maximum solar activity, however, the accuracy extrapolated from Part 1 information diminishes if the extrapolations are carried much more than a week ahead.

Parts II and III of the bulletins are quite lengthy. Part II (Day) contains predicted subpoint and height data at two-minute intervals for the portion of the orbit that is sunlit north of the equator. Part III (Day) contains predicted subpoint and height data at two-minute intervals for the portion of the orbit in darkness north of the equator. Part III (night) contains predicted subpoint and height data at two-minute intervals for the portion of the orbit in darkness south of the equator. All times are referenced to the ascending node (northbound equator crossing) and are given as minutes after or before this time (refer to Figure 5.1-1).

Part IV is relatively short, and usually consists of four items: a code group, transmission frequencies of each operating direct readout sensor system, the on-board clock variations and remarks. The code group consists of orbital parameters used to generate parts I through III. It is intended for use by those station operators needing more precision in satellite tracking and having appropriate computer programs to ingest such data and produce both equator crossings and antenna pointing angles.

The remarks in Part IV are in plain language and advise of problems or changes in the mode of operating the satellite, including the AVHRR/3 channels selected for the APT transmissions. Direct readout transmission frequencies are discussed elsewhere; in summary, the APT service for NOAA KLM will utilize 137.50 or 137.62 MHz; the HRPT will transmit on 1698.0 or 1707.0 MHz (1702.5 MHz is available for standby); the DSB beacon will operate on 137.35 or 137.77 MHz.

## **5.2 ALTERNATE SOURCES AND FORMS OF SATELLITE PREDICTION POSITION INFORMATION**

The primary source for orbital prediction information for NOAA operated satellites is directly from NOAA via the Global Telecommunications System (GTS) and the Internet, and the main form of this information is the TBUS bulletin. .

These alternate sources include, but are not limited to, WEFAX broadcasts from U.S. geostationary satellites, electronic mail, telephone bulletin board systems, high frequency radio broadcasts, commercial environmental data providers, and the Aeronautical Fixed Telecommunications Network (AFTN).

NOAA maintains an Internet site (the NOAASIS) that always has the current TBUS bulletins. The TBUS bulletin is also broadcast once daily as part of the WEFAX transmission from U.S. geostationary satellites, for stations within range and with the proper receiving equipment.

With the proper receiving equipment r, some station operators are able to intercept the GTS radio-teletype (RTTY) meteorological transmissions containing the TBUS message. A number of major communications centers on the GTS relay this information via radio-teletype, especially for the use of ships on the high seas. Potential users would have to contact the nearest major center for frequencies and schedules.

In Africa and parts of the Middle East, a number of government meteorological services receive the TBUS bulletin as part of the Meteorological Data Distribution (MDD) broadcast via the METEOSAT geostationary satellite. Satellite readout station operators without other sources of orbital information are urged to contact an office of their national meteorological service to see if arrangements can be made to obtain copies of these messages.

The nonprofit, Radio Amateur Satellite Corporation (AMSAT) and its affiliates around the world serving the amateur radio community, broadcast the two line element messages daily via packet radio teletype. These broadcasts can be received in many parts of the world.

As of mid-1995, the U.S. Coast Guard included the TBUS message in high frequency, radio teletype broadcasts directed at the eastern and central North Pacific Ocean.

A more complete list of satellite navigation sources and points of contact is included in Appendix E.

Apart from the TBUS messages, the other most common form for transmitting orbital information is the two-line element (TLE) messages. These have the advantage of being very compact, and can be incorporated into many computer programs which will produce accurate satellite tracking and gridding information. The two-line, mean Keplerian orbital elements are derived from the NORAD SGP4 (Simplified General Perturbation) model. While similarly named elements appear in both the two-line and TBUS messages, the values are not

interchangeable between systems to compute satellite tracks using the TBUS or NORAD two-line elements. Doing so will result in large errors. Details on decoding the two-line element messages appear in Appendix A.

## 5.2.1 SOURCES OF ORBITAL INFORMATION FOR NOAA POLAR ORBITING SATELLITES

### 5.2.1.1 Internet

The NOAA Satellite Information System (NOAASIS) web site is a central location for finding information about NOAA environmental satellites (GOES and POES). Information is provided by various contributors within the National Environmental Satellite, Data, and Information Service (NESDIS) and the external satellite community. This site provides information of particular interest to users who operate their own direct readout receiving stations.

The NOAASIS is operated by the Satellite Product and Services Division, Direct Services Branch, within the Office of Satellite and Product Operations (OSPO). In addition to providing assistance to the global direct readout community, the Data Services Branch has responsibilities for Search and Rescue Satellite-Aided Tracking (SARSAT) and the GOES and Polar Data Collection Systems (LRIT, GOES DCS, Argos DCS).

## 6.0 INGEST AND PRE-PROCESSING

Operation of the various satellite data processing systems is principally the responsibility of NOAA/NESDIS' Office of Satellite and Products Operations (OSPO). Data were ingested into the former Information Processing Division's Central Environmental Satellite Computer System (CEMSCS) until October 6, 2006. After October 6, 2006 data were ingested into the Data Distribution Server (DDS) from the Satellite Operations and Control Center (SOCC) and from the Shared Processing Network (SPN). The DDS has ingest and preprocessing systems for Polar, Geostationary and Shared Processing. The system described in this document is most relevant to the DDS Polar Data Processing System (PDPS). The PDPS operation consists of components such as pre-launch activities, ingest, pre-processing, calibration, navigation, product generation and archive. Figure 6.0-1 shows the general flow of the polar data through the PDPS system.

NOAA's data levels are defined as follows:

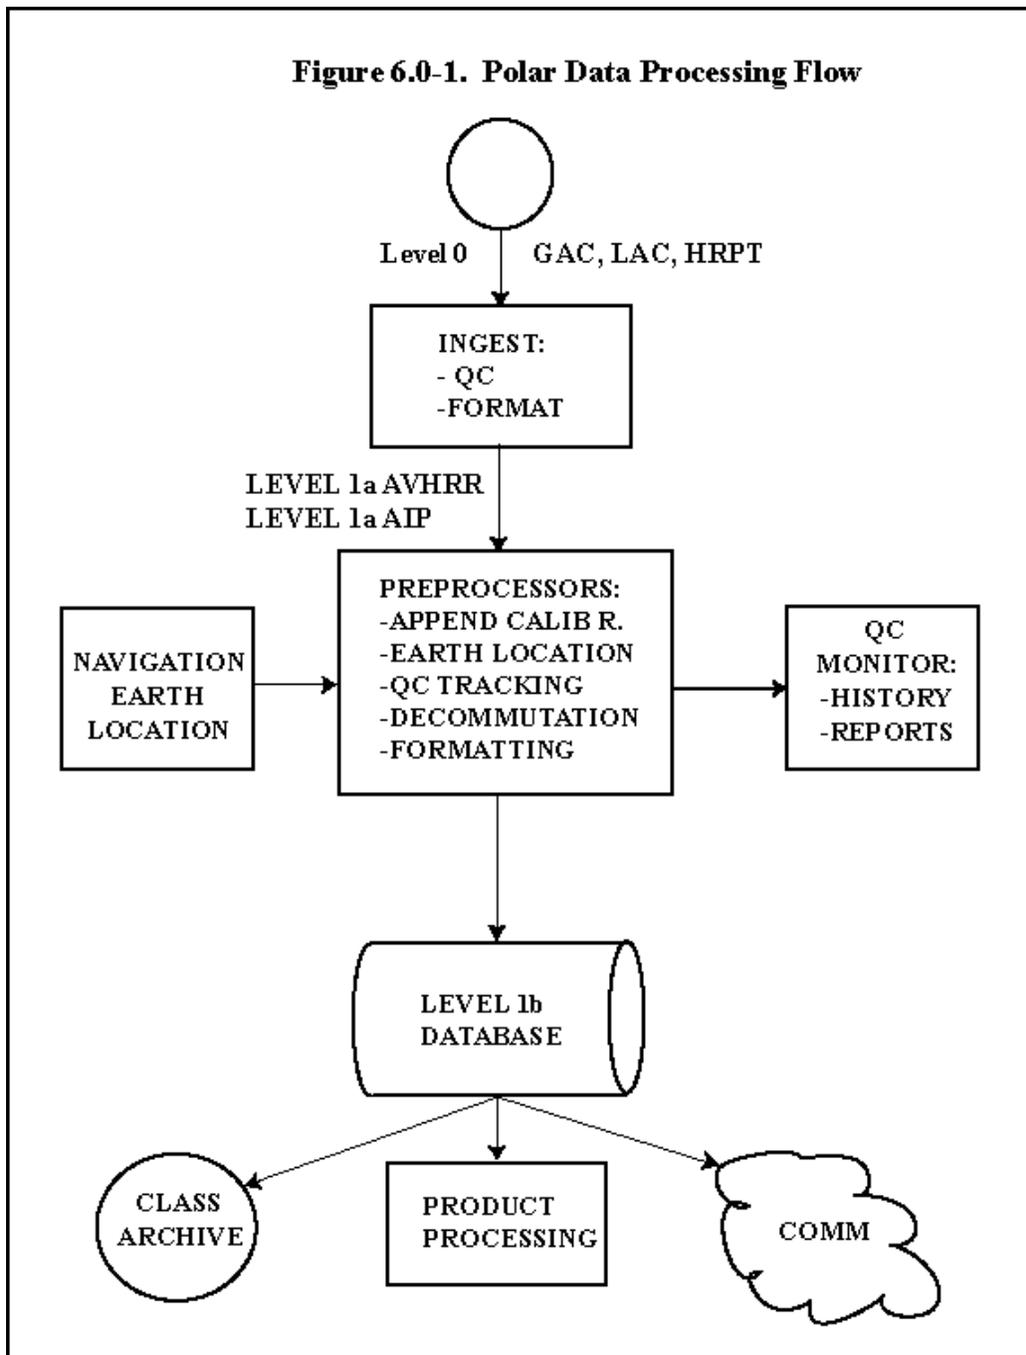

Level 0 - Unprocessed telemetry data as received from the observing platform excluding communications artifacts introduced by the ground system.

Level 1a - Telemetry data that have been extracted but not decommutated from Level 0 and formatted into time-sequenced data sets for easier processing. The Level 1a formats are NOAA's internal formats and are only used for NOAA processing. They only exist briefly for the purpose of creating the Level 1b datasets.

Level 1b - Discrete, instrument-specific data sets derived from Level 1a containing unprocessed data at full resolution, time-referenced, and annotated with ancillary information including data quality indicators, calibration coefficients and georeferencing parameters.

The software systems that are implemented, operated and maintained, are in the following functional categories: Ingest (Level 1a), satellite dataset processing (Pre-Processing Level 1b), product processing, archiving, QC-monitoring, navigation and earth-location, data communications, calibration (pre- and post-launch) and Shared Processing.

**Figure 6.0-1. Polar Data Processing Flow**

**Figure 6.0-1. Polar Data Processing Flow**

## **6.1 INGEST**

Special purpose hardware/software is used to receive (ingest) data into the DDS. This software includes polar satellite data, geostationary (GOES) satellite data, and Shared Processing data as received from, or transmitted between, the NESDIS and either the Air Force Global Weather Central (AFGWC) or the Navy Fleet Numerical Meteorological and Oceanographic Center (FNMOC).

Basically, the ingestor accomplishes the function of transforming the satellite Level 0 to a more processing friendly Level 1a data set as follows:

1. Accepts and synchronizes frames of Level 0 satellite data.
2. First level quality control of data stream, filling data gaps as necessary. Generation and forward of a data quality/status file.
3. Extracting AVHRR and AIP data from Level 0 data and formatting to a Level 1a. These two data sets are made available for the process of Level 1b transformation.
4. Generation of a unique data set name which includes an orbit number and time duration of the pass.

## **6.2 PRE-PROCESSING**

Data pre-processing is a set of functions which combine to create the Level 1b databases. The software formats, error checks, calibrates, and appends earth locations and otherwise manages the ingested data. Raw spacecraft data are processed via Polar Acquisition and Control Subsystems (PACS) and made available to the Pre-Processing operation via the Ingest System as Level 1a data sets. The transformation of ingested data of Level 1a format into one or more data sets of Level 1b format primarily consists of the addition of instrument calibration coefficients and earth location information to the raw data stream. The transformation also provides supplemental data about the calibration process and thus indirectly about the instruments onboard the satellite. Data in the Level 1b format are made accessible for products, archival, file transfer and are used by the meteorological and Climatological communities.

### **6.2.1 SYSTEM IMPROVEMENTS**

The pre-NOAA KLM series of TIROS polar spacecraft have retained the same basic format of raw data streams for over 20 years. The NOAA KLMNN' series have undergone several format changes and somewhat larger volumes of data. The NOAA KLM Pre-Processing system has processed both old and new spacecraft data. The software is modular and structured to allow platform independence. Program structures have been designed to take advantage of modern operating systems with distributed processing providing faster availability of data products.

## 6.2.2 LEVEL 1b DATABASE IMPROVEMENTS

Enhancements have been made to the methods of access and storage of the Level 1b data. With the old system (pre-NOAA KLM), a change made in spacecraft or instrument configuration, would result in a change in the format of the encapsulation of the Level 1b data. When such a change was made in the up-front systems, the change had to ripple to the end user. A new Level 1b generating system (Level 1b\*) provides a centralized database which contains the basic elements of the Level 1b and the associated supporting ancillary data. The database provides end-to-end accountability for data and data products to managers and users. The new system (Level 1b\*) provides a universal access to the component elements of the dataset, thus providing transparency to the Level 1b format. Access to the Level 1b\* database is facilitated by a library of utilities layered in a tree structure.

The facilities and services provided by the Level 1b\* offers a means of simplifying and improving the interfaces of the Calibration Monitoring System. Specifically, these interfaces are between the Pre-processing input to the monitoring and monitoring output of status reporting to the users. The calibration process performed by the Pre-Processor passes resulting parameters to the offline monitoring system. The parameters transit an interface referred to as History Files. The Level 1b\* database library has structures and utilities defined specifically to contain and access the information sent to the History File. This provides for a modifiable and maintainable system that is much more flexible than the old version.

## 6.3 CALIBRATION

Calibration and Data Monitoring consist of three software systems residing on the DDS:

- Pre-launch calibrations,
- Online instrument data calibration and monitoring
- Engineering evaluation.

### 6.3.1 PRE-LAUNCH CALIBRATION

The pre-launch calibration is the process which prepares the operational data pre-processing systems for new satellites and their instruments. This includes validation of instrument supplier's success in meeting instrument performance requirements. Each instrument manufacturer is required to supply parameters related to the characteristic performance of the instrument. Instrument Specifications are then validated with the accomplishment of: calculating the calibration accuracy; the instrument sensitivity; in-flight warm load; calibration correction factors; the calibration repeatability; and nonlinearity parameter for each channel. A report is generated which contains the plots of all thermal vacuum data derived quantities for each flight model, as well as a narrative description of how each quantity is computed.

### 6.3.2 ON LINE CALIBRATION

As part of normal operations, the data preprocessing software performs online instrument data calibration and monitors instrument telemetry to detect anomalies. When anomalies are detected, the data is flagged as suspect for the product systems.

### 6.3.3 CALIBRATION EVALUATION

Engineering evaluation is carried out as part of off-line support. The data calibration process is evaluated to provide evidence of instrument performance problems. This includes extracting selected data words, computing statistics and displaying/printing the information for analysis.

## 6.4 MONITORING AND QUALITY ASSURANCE

Monitoring software examines the real-time operation of the software system or performance of an instrument and generates operator error messages, statistics and reports. Comparison with appropriate "truth" data is also required in the monitoring system. Printouts and/or interactive data displays are examined for credibility.

## 7.0 CALIBRATION OF NOAA KLM INSTRUMENTS

The calibration of a satellite radiometer involves finding the transfer function between digital counts from the instrument and the scene input spectral radiance for all the instrument's spectral channels.

In the infrared region of the spectrum, calibration is accomplished by using accurate blackbodies in a thermal/vacuum (T/V) environment. A T/V chamber is used to avoid atmospheric effects and to better simulate the space environment in which the instrument must ultimately operate. The T/V chamber contains accurate extended area blackbody cavities which are used as infrared sources. Calibration traceability to the National Institute for Standards and Technology (NIST) is via the temperature of the blackbody.

In the visible region, calibration is performed on a test bench. No significant errors are introduced by performing the calibration in this manner. The laboratory source most used to calibrate visible channels is an integrating sphere. The integrating sphere is the device used to create a visible radiance which is traceable to the NIST. Calibration of the AVHRR and HIRS visible channels uses one 102 cm (40-in) sphere exclusively in order to aid inter-instrument calibration consistency.

In the ultraviolet region, calibration is performed using several calibrated standard lamps; a quartz-halogen lamp for use in the 250-400 nm range, an argon mini-arc for the 160-280 nm range and a deuterium (D<sub>2</sub>) lamp covering the total spectral range. In the microwave region, calibration is performed in a T/V environment using calibrated blackbody radiometric sources.

Calibration updates to characterize the in-orbit performance of the visible and near-infrared channels of the AVHRR are introduced in the Level 1b data when necessary by NESDIS. The historical visible calibration notices are available under the NESDIS Special Bulletins section at <http://www.ssd.noaa.gov/PS/SATS/bulletins.html>.

The SEM-2 TED and MEPED responses are calibrated with particle (proton and electron) beams, with the results summarized in a Calibration Report for each instrument. The TED calibrated responses vary slightly from unit to unit, since the Continuous Dynode Electron Multiplier (CDEM) detectors have slightly varying detection efficiencies. The MEPED particle responses are essentially identical for all units. The TED and MEPED also have In-Flight Calibration cycles which verify the stability of the electronic gains, thresholds, channel logic, and detector noise.

### 7.1 AVHRR

The NOAA KLM Advanced Very High Resolution Radiometer, Version 3 (AVHRR/3), differs from AVHRR Versions 1 and 2 flown on the earlier POES satellites. The AVHRR/3 is a six channel instrument, with three of the channels located in the visible and near-infrared regions of the spectrum, having effective wavelengths around 0.63 micrometers (channel 1), 0.86 micrometers (channel 2) and 1.6 micrometers (channel 3A), while the remaining three are located in the atmospheric window regions in the infrared with effective wavelengths centered around 3.7 micrometers (channel 3B), 10.8 micrometers (channel 4) and 11.5 micrometers (channel 5). Since quantitative radiometric applications of the AVHRR radiance measurements have become increasingly important both in research and operational environments, it has been

necessary to accurately calibrate the sensors in order that the AVHRR radiance measurements meet the stringent performance requirements necessitated by the accuracy requirements of the products derived from these radiances. For example, accuracies on the order of less than 2% are desired in the AVHRR radiances measured in channels 1, 2 and 3A. These radiances are used for improving the accuracy of atmospheric aerosol retrievals over the oceans in order that they may be used with confidence in atmospheric energy studies. Similarly, the well established need that sea surface temperatures determined using the brightness temperatures measured in channels 3B, 4 and 5 should be accurate to within a few tenths of a degree Kelvin for use in climate and global change studies. This need necessitated development of user friendly correction procedures for the non-linearities associated with the AVHRR thermal infrared channels and also imposes stringent requirements on the allowable noise-equivalent temperatures associated with the same.

Against this background, the procedures for the pre- and post-launch calibration of the different AVHRR channels are described. This description is based on the work performed at the NOAA/NESDIS Center for Satellite Applications and Research (STAR) and on the material furnished by ITT Aerospace/Communications Division, Fort Wayne, Indiana (the instrument manufacturer).

### 7.1.1 Visible and Near-Infrared Channels

#### 7.1.1.1 Pre-launch Calibration

The visible and near-infrared channels of the AVHRR/3 were calibrated prior to launch at the facilities of ITT, following a protocol which has evolved over the past two decades. A 102 cm (40 in) diameter integrating sphere is used as the source of illumination. The integrating sphere is equipped with seventeen 45-W lamps and three 150-W lamps mounted in a ring pattern. The radiance emerging from the integrating sphere port which has a diameter of 35.6 cm (14 in), can be varied over three orders of magnitude by illuminating the sphere with a suitable combination of the various lamps. A separate 11.4 cm (4.5 in) diameter integrating sphere, equipped with a 45-W lamp and an aperture wheel, is used as the source when lower levels of illumination are desired. The level of illumination is varied in twenty-five steps for channel 1; sixteen steps for channel 2; and 11 steps for channel 3A. At each level of illumination of the integrating sphere, 3600 measurements of the signal issuing from the AVHRR when it views the sphere and the space clamp target are made, and the mean and standard deviation recorded, and converted to digital counts on a 10-bit scale. Generally, the AVHRR signals when it views the integrating sphere with all of the lamps turned off, and when it views the space clamp target (essentially a blackbody) are very close to each other.

The integrating sphere is periodically calibrated for its spectral output and linearity with an Optronic Laboratories Model OL750S Automated Spectroradiometer System and an Optronic Laboratories Model OL410 Integrating Sphere Standard; the Integrating Sphere Standard is traceable to radiance standards maintained at NIST. The uncertainty in the calibration of the 102 cm (40 in) integrating sphere source is estimated to be of the order of 5%.

It should be noted that the AVHRRs were calibrated at intervals not to exceed one year, until

they were launched. The last calibration was performed as close to the launch as practicable. Greater details of the pre-launch calibration of the AVHRR are found in Rao (1987).

It is the usual practice in NOAA to give the pre-launch calibration results in the form of a simple linear regression relationship between the measured AVHRR signal,  $C_{10}$ , expressed in ten-bit counts, and the albedo,  $A$ , of the integrating sphere source at different levels of illumination.

Thus,

$$A \equiv SC_{10} + I \quad (7.1.1.1-1)$$

Where  $S$  is the slope (percent albedo/count) and  $I$  is the intercept (percent albedo) listed in the Level 1b data under the heading “pre-launch”. **It should therefore be noted that the use of these slope and intercept values with the measured AVHRR will yield the albedo in percent under the assumption that the pre-launch calibration is valid in orbit.**

The albedo  $A$  (or the reflectance factored or scaled radiance) of the Earth scene is given by:

$$A(\text{percent}) = \frac{100\pi I}{F} \quad (7.1.1.1-2)$$

Where  $I$  and  $F$  are, respectively, the in-band radiance ( $\text{W m}^{-2} \text{sr}^{-1}$ ) of the Earth scene and the extraterrestrial solar irradiance ( $\text{W m}^{-2}$ ) at normal incidence at the top of the atmosphere at mean Earth-Sun distance,  $I$  and  $F$  are given by:

$$I = \int_{\lambda_1}^{\lambda_2} I_{\lambda} \tau_{\lambda} d\lambda \quad ((7.1.1.1-3)$$

And

$$F = \int_{\lambda_1}^{\lambda_2} F_{0\lambda} \tau_{\lambda} d\lambda \quad (7.1.1.1-4)$$

where  $\tau_{\lambda}$  is the normalized response of the instrument at the wavelength  $\lambda$ ,  $I_{\lambda}$  is the radiance ( $\text{W m}^{-2} \text{sr}^{-1} \text{:m}^{-1}$ ) and  $F_{0\lambda}$  is the extraterrestrial solar irradiance ( $\text{W m}^{-2} \text{:m}^{-1}$ ) at the wavelength  $\lambda$ ; where  $\lambda_1$  and  $\lambda_2$  are the lower and upper cut-off wavelengths of the channel. Other quantities are the equivalent width  $\omega$  (:m) and the effective wavelength  $\lambda_e$  given by:

$$\omega = \int_{\lambda_1}^{\lambda_2} \tau_{\lambda} d\lambda \quad (7.1.1.1-5)$$

And

$$\lambda_e = \frac{\int_{\lambda_1}^{\lambda_2} \lambda F_{0\lambda} \tau_{\lambda} d\lambda}{F} \quad (7.1.1.1-6)$$

It should be noted that the albedo calculated using Equation 7.1.1.1-2 shows a small but finite

variation with the extraterrestrial solar irradiance spectra used in the calculation of F. It is thus preferable to work with the in-band radiance I or the radiance  $I_8$ ; however, these quantities are not included in the Level 1b data stream.

A salient feature of the AVHRR/3 is the use of dual gain detection circuitry in the visible and near-infrared channels to enhanced radiometric resolution at the lower end of the dynamic range of the albedo; this results in minor losses in resolution at the higher values of albedo. The dual gain settings for channels 1, 2 and 3A are given in Table 7.1.1.1-1 below.

<b>Channel</b>	<b>Albedo range (percent)</b>	<b>Counts</b>
1 and 2	1-25	0-500
	26-100	501-1000
3A	1-12.5	0-500
	12.6-100	501-1000

The dual gain feature necessitates the use of two sets of slope and intercept values for channels 1, 2 and 3A to accommodate the two gain ranges. Thus, the Level1b data has, in addition to the prelaunch calibration coefficients, two sets of slope and intercept values for each of the three channels based on post-launch calibration (see next section). These are listed under the heading “operational” in the Level 1b data stream.. As mentioned earlier, since these slope and intercept values are in the albedo (or reflectance factor or scaled radiance) representation, use of the same with the AVHRR Earth scene signal will yield the albedo (in percent). The dual gain cross-over point is defined as the count value at which both the high and low range regression equations for the albedo A will yield the same value of the albedo. The cross-over point was determined using the pre-launch integrating sphere and the electronic calibration ramp. The user can find the slope and intercept values, and the values of F, o, and  $\delta_e$  in Appendix D.

#### 7.1.1.2 Post Launch Calibration

The visible and near-infrared channels of the TIROS-N series of AVHRRs were known to degrade in orbit and similar degradations were observed in Channels 1, 23a of the NOAA KLM AVHRR/3.

The absence of on board calibration devices for these channels necessitated the development of vicarious techniques for post-launch calibration. Accordingly, vicarious calibration techniques that have been developed (e.g. Rao and Chen 1995) to characterize the post-launch performance of Channels 1 and 2 of the TIROS-N AVHRRs, were adapted to the AVHRR/3. These techniques use radiometrically stable terrestrial calibration target sites and congruent path aircraft/satellite measurements to monitor the calibration of the instrument as a function of time. These techniques have been modified to account for the split-gain feature of the instrument.

#### 7.1.2 Thermal Infrared Channels (channels 3B, 4 and 5)

### 7.1.2.1 Pre-launch Calibration

Pre-launch calibration of the infrared channels was carried out in a thermal vacuum chamber to simulate conditions in space. The radiometer sequentially views three blackbody targets, a cold target ( $\approx 95K$ ) representing cold space, an external laboratory blackbody representing “Earth”, and its own warm blackbody, the internal calibration target (ICT). The sequence is the same as show in Figure 7.1.2.2-1. All blackbody sources have calibrations traceable to NIST. The internal and external blackbody temperatures are measured by Platinum Resistance Thermometers (PRTs). From these temperatures, AVHRR radiances for each thermal channel are computed. The AVHRR outputs 10-bit count values, integers in the 0-1023 range. The detection circuits for these channels are such that count output increases when incoming radiance decreases.

The entire pre-launch calibration test cycle was repeated on three, four or five separate days. Each day, the instrument operating temperature (measured by the PRTs) was fixed at a different value in the 10, 15, 20, 25 and 30C range for the entire cycle. This range brackets the range of operating temperatures encountered in orbit. For each calibration run, temperature (radiance) and count data were collected as the laboratory blackbody cycled through 15-17 temperature plateaus between 180 K and 335 K, which spans the entire range of Earth target temperatures.

### 7.1.2.2 In-orbit Calibration Overview

During each in-orbit scan line, the AVHRR views three different types of targets, as shown in Figure 7.1.2.2-1. It first outputs 10 counts when it views cold space, then a single count for each of the 2,048 Earth targets (pixels), and finally 10 counts when it views the internal blackbody target. (Only the AVHRR scan mirror actually rotates). The cold space and internal blackbody target views are used to calibrate the AVHRR, because a radiance value can be independently assigned to each target.

Figure 7.1.2.2-1. AVHRR Thermal Channel Calibration Sequence.

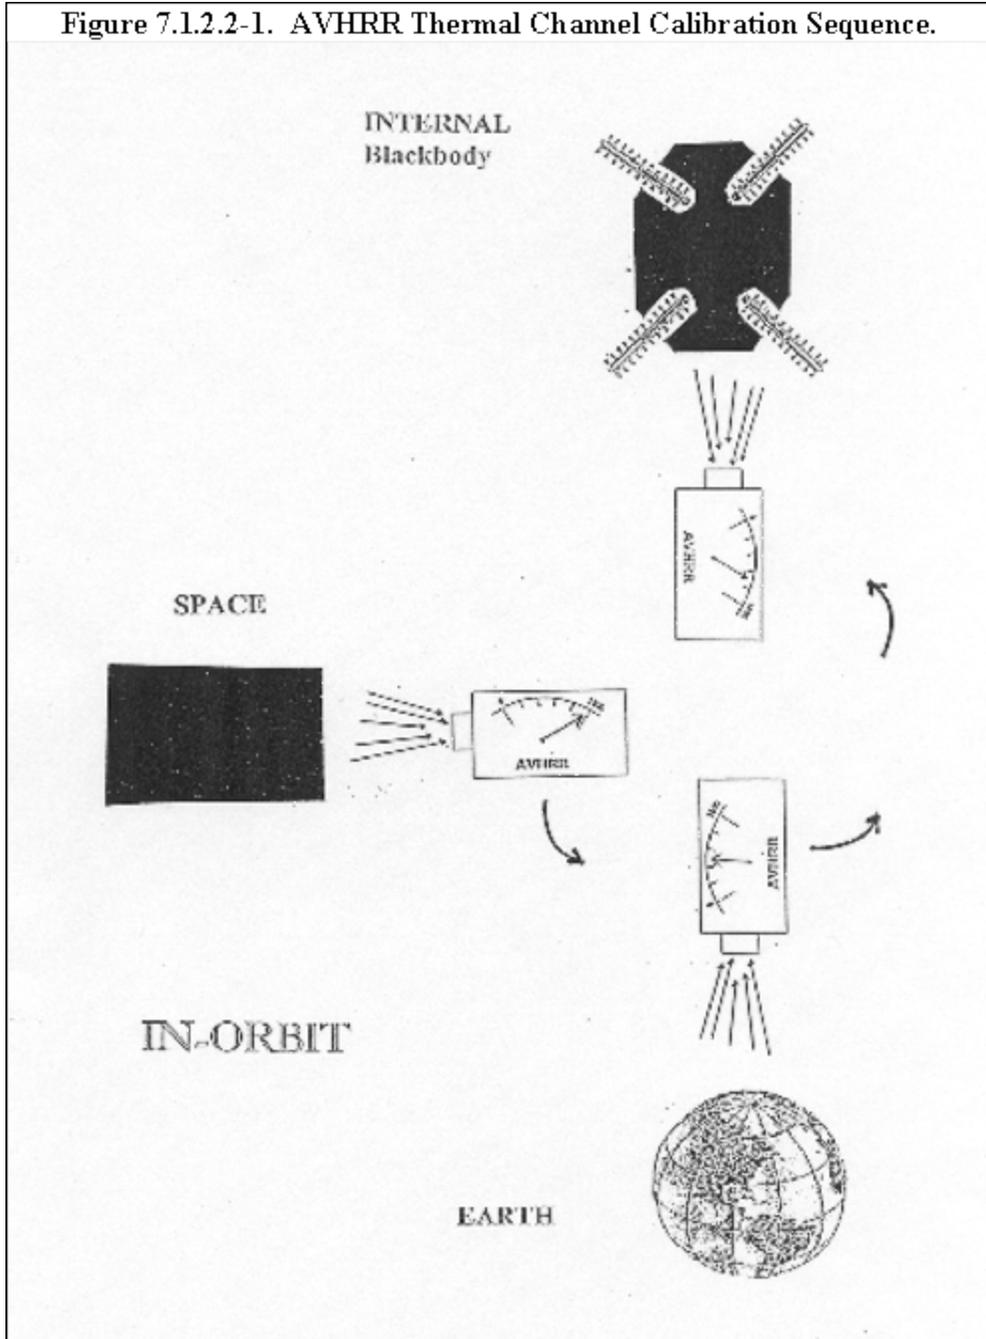

Figure 7.1.2.2-1. AVHRR Thermal Channel Calibration Sequence

The internal blackbody temperature  $T_{BB}$  is measured by four Platinum Resistance Thermometers (PRTs) embedded in the AVHRR instrument. The radiance  $N_{BB}$  received by the AVHRR from the internal blackbody in each thermal channel is computed from  $T_{BB}$  the spectral response (filter) function of each channel. The radiance of space value  $N_S$ , designed to accurately account for pre-launch information, and is computed from pre-launch data. These radiances, together with the average space count  $C_S$  and average blackbody count  $C_{BB}$  provide two points ( $C_{BB}$ ,  $N_S$ ) on the radiance versus count graph. A straight line drawn between the two points generates the

linear radiance versus count estimate. The AVHRR count output  $C_E$  from viewing an Earth target is substituted into the linear equation and produces linear radiance  $N_{LIN}$ . Pre-launch measurements indicate that the actual radiance versus count graph is quadratic so  $N_{LIN}$  is input into a quadratic equation, defined by pre-launch measurements, to give the nonlinear radiance correction  $N_{COR}$ . The incoming radiance  $N_E$  from the Earth target that causes AVHRR output count value  $C_E$  is found by adding  $N_{COR}$  to  $N_{LIN}$ . An equivalent blackbody temperature  $T_E$  can be computed from Earth radiance value  $N_E$ .

### 7.1.2.3 Steps to Calibrate the AVHRR Thermal Channels (Level 1b Data Users)

Starting with the NOAA-15 (NOAA-K) satellite, NESDIS incorporated the nonlinear radiance corrections for AVHRR thermal channels 4 and 5 into the Level 1b data stream. The corrections are in the GAC and LAC datasets, and also in the HRPT datasets produced operationally by NESDIS. Users compute the scene radiance,  $N_E$  in units of  $mW/(m^2-sr-cm^{-1})$  from the 10-bit earth-scene count,  $C_E$ , by the formula:

$$N_E = a_0 + a_1 C_E + a_2 C_E^2 \quad (7.1.2.3-1)$$

There is one set of coefficients for each thermal channel 3B, 4 and 5 in the NOAA KLM Level 1b dataset. The channel 3B detector responds linearly to incoming radiance so for channel 3B the coefficient  $a_2$  will always be 0. Section 8 contains format information about how the Level 1b data are stored. The coefficient  $a_0$  for AVHRR channel 4 is specified as "IR Operational Cal Ch4 Coefficient 1"; etc

As a numerical example, suppose  $C_E = 410$  for Channel 4, and  $a_0 = 155.58$ ,  $a_1 = -0.1668$  and  $a_2 = 0.000010$ , then,

$$N_E = 155.58 - 0.1668 \times 410 + 0.000010 \times (410)^2 = 88.9 \text{ mW}/(m^2-sr-cm^{-1})$$

To convert the computed Earth scene radiance value  $N_E$  into an equivalent black body temperature value  $T_E$ , use the two-step process defined by Equations 7.1.2.4-8 and 7.1.2.4-9 in section 7.1.2.4.

The constants for converting radiance to black body temperature are also found in the Level 1b LAC and GAC Header Records, but in a slightly different form. In Tables 8.3.1.3.2-1 and 8.3.1.4.2-1 (for LAC and GAC data, respectively), under the heading radiance conversion (octets 281-328), channels 3B, 4 and 5 each have three sets of constants; these constants are called central wavenumber, constant1 and constant2. The central wavenumber value  $\Lambda_c$  is used in Equation 7.1.2.4-8 to calculate  $T_E^*$ , and the blackbody temperature  $T_E$  is computed by the formula:

$$T_E = \text{constant1} + (\text{constant2}) T_E^*$$

### 7.1.2.4 Steps to Calibrate the AVHRR Thermal Channels (HRPT Receiving Station Data Users)

**Step 1.** The temperature of the internal blackbody target is measured by for PRTs. In each scanline, data words 18, 19 and 20 in the HRPT minor frame format contain three readings from one of the four PRTs. (See Section 4.1.3) A different PRT is sampled each scanline; every fifth scanline all three PRT values are set equal to 0 to indicate that a set of four PRTs has just been sampled. The count value  $C_{PRT}$  of each PRT is converted to temperature  $T_{PRT}$  by the formula

$$T_{PRT} = d_0 + d_1 C_{PRT} + d_2 C_{PRT}^2 + d_3 C_{PRT}^3 + d_4 C_{PRT}^4 \quad (7.1.2.4-1)$$

The coefficients  $d_0$ ,  $d_1$ ,  $d_2$ ,  $d_3$  and  $d_4$  vary slightly for each PRT. Values for the coefficients are found in Appendix D, in Table D.1-8 for NOAA-15 (coefficients  $d_3$  and  $d_4$  are 0 for NOAA-15), Table D.2-9 for NOAA-16, Table D.3-3 for NOAA-17 and Table D.4-3 for NOAA-18. To calculate the internal blackbody temperature  $T_{BB}$ , NESDIS uses the simple average

$$T_{BB} = \frac{(T_{PRT1} + T_{PRT2} + T_{PRT3} + T_{PRT4})}{4} \quad (7.1.2.4-2)$$

**Step 2.** The radiance  $N_{BB}$  sensed in each thermal AVHRR channel from the internal blackbody at temperature  $T_{BB}$  is the weighted mean of the Planck function over the spectral response of the channel. The spectral response function for each channel is measured in approximately 200 wavelength intervals and provided to NESDIS by the instrument manufacturer. In practice, a look-up table relating radiance to temperature is generated for each channel. Each table specifies the radiance for every tenth of a degree (K) between 180 and 340K. The tables are referred to as “Energy Tables”. It has been found that the following two-step equation accurately reproduces Energy Table equivalent blackbody temperatures to within  $\forall 0.01K$  in the 180 to 340K range. Each thermal channel has one equation, which uses a centroid wavenumber  $\Lambda_c$  and an “effective” blackbody temperature  $T_{BB}^*$ . The two steps are:

$$T_{BB}^* = A + BT_{BB} \quad (7.1.2.4-3)$$

$$N_{BB} = \frac{c_1 \nu_e^3}{\frac{c_2 \nu_c}{e^{T_{BB}^*}} - 1} \quad (7.1.2.4-4)$$

Where the first and second radiation constants are:

$$c_1 = 1.1910427 \times 10^{-5} \text{ mW}/(\text{m}^2\text{-sr}\text{-cm}^{-4})$$

$$c_2 = 1.4387752 \text{ cm}\cdot\text{K}.$$

The values for  $\Lambda_c$  and the coefficients A and B for channels 3B, 4 and 5 are unique for each spacecraft and are found in Appendix D; Table D.1-11 for NOAA-15, Table D.2-12 for NOAA-16, Table D.3-7 for NOAA-17 and Table D.4-7 for NOAA-18. The single centroid wavenumber for each channel replaces the method for previous AVHRRs, which used a different central wavenumber in each of four temperature ranges. In the previous version of this documentation,

the A coefficients in Tables D.1-11 and D.2-12 were minus numbers and the B coefficients were slightly greater than one. They were used to convert radiance into equivalent blackbody temperature, and converted “effective” temperature  $T_{BB}^*$  into  $T_{BB}$ , instead of the reverse way as shown in Equation 7.1.2.4-3.

**Step 3.** Output from the two in-orbit calibration targets is used to compute a linear estimate of the Earth scene radiance  $N_E$ . Each scanline, the AVHRR views the internal blackbody target and outputs 10 count values for each of the three thermal channel detectors; these are found in words 23 to 52 in the HRPT data stream. When the AVHRR views cold space, 10 counts from each of the five channel sensors are output and placed into words 52 to 102. (Table 4.1.3-1 describes how these data are multiplexed.) Count values for each channel are averaged together to smooth our random noise; often counts from five consecutive scanlines are averaged because it takes five lines to obtain a set of all four PRT measurements. The average blackbody count  $C_{BB}$  and the average space count  $C_S$ , together with blackbody radiance  $N_{BB}$  and space radiance  $N_S$ , explained in the next paragraph, are used to compute the linear radiance estimate  $N_{LIN}$ ,

$$N_{LIN} = N_S + (N_{BB} - N_S) \frac{(C_S - C_E)}{(C_S - C_{BB})} \quad (7.1.2.4-5)$$

where  $C_E$  is the AVHRR count output when it views one of the 2,048 Earth targets.

The detector in thermal channel 3B has a linear response to incoming radiance so the linear radiance computed from Equation 7.1.2.4-5 is the correct value for channel 3B. For this channel, the radiance of space value  $N_S$  is actually = 0; no nonlinear corrections need to be made.

The Mercury-Cadmium-Telluride detectors used for channels 4 and 5 have a nonlinear response to incoming radiance. Pre-launch laboratory measurements show that:

- a. scene radiance is a slightly nonlinear (quadratic) function of AVHRR output count,
- b. the nonlinearity depends on the AVHRR operating temperature.

It is assumed that the nonlinear response will persist in orbit. For the NOAA KLM series of satellites, NESDIS uses a radiance-based nonlinear correction method. IN this method, the linear radiance estimate is first computed using a non-zero radiance of space, the  $N_S$  term in Equation 7.1.2.4-5. Then, the linear radiance value is input into a quadratic equation to generate the nonlinear radiance correction  $N_{COR}$ :

$$N_{COR} = b_0 + b_1 N_{LIN} + b_2 N_{LIN}^2 \quad (7.1.2.4-6)$$

Finally, the Earth scene radiance is obtained by adding  $N_{COR}$  to  $N_{LIN}$ ,

$$N_E = N_{LIN} + N_{COR}$$

Introducing the non-zero radiance of space value is a mathematical device which has two primary advantages. First, only one quadratic correction equation per channel is necessary; the

quadratic coefficients are independent of AVHRR operating temperature. Second, the method reproduces pre-launch measurements very well; RMS differences between the fitted data and the measured data are approximately 0.1K for both channels 4 and 5. Values for  $N_S$  and the quadratic coefficients  $b_0$ ,  $b_1$  and  $b_2$  are found in Appendix D, Table D.1-14 for NOAA-15, and Table D.2-15 for NOAA-16, Table D.3-2 for NOAA-17 and Table D.4-2 for NOAA-18.

**Step 4.** Data users often convert the computed Earth scene radiance value  $N_E$  into an equivalent blackbody temperature  $T_E$ . This temperature is defined by simple inverting the steps used to calculate the radiance  $N_E$  sensed by an AVHRR channel from an emitting blackbody at a temperature  $T_E$ . The two-step process is:

$$T_E^* = \frac{c_2 \nu_c}{\ln \left[ 1 + \left( \frac{c_1 \nu_c^3}{N_E} \right) \right]} \quad (7.1.2.4-8)$$

$$T_E = \frac{T_E^* - A}{B} \quad (7.1.2.4-9)$$

The values for  $\Lambda_c$  and the coefficients A and B are again found in appendix D; Table D.1-11 for NOAA-15, Table D.2-12 for NOAA-16, Table D.3-7 for NOAA-17 and Table D.4-7 for NOAA-18.

#### 7.1.2.5 Summary of Calibration Equations for HRPT Users

Compute the blackbody temperature:

$$\begin{aligned} T_{PRT1} &= d_0 + d_1 C_{PRT1} + d_2 C_{PRT1}^2 + d_3 C_{PRT1}^3 + d_4 C_{PRT1}^4 \\ T_{PRT2} &= d_0 + d_1 C_{PRT2} + d_2 C_{PRT2}^2 + d_3 C_{PRT2}^3 + d_4 C_{PRT2}^4 \\ T_{PRT3} &= d_0 + d_1 C_{PRT3} + d_2 C_{PRT3}^2 + d_3 C_{PRT3}^3 + d_4 C_{PRT3}^4 \\ T_{PRT4} &= d_0 + d_1 C_{PRT4} + d_2 C_{PRT4}^2 + d_3 C_{PRT4}^3 + d_4 C_{PRT4}^4 \end{aligned}$$

$$T_{BB} = \frac{(T_{PRT1} + T_{PRT2} + T_{PRT3} + T_{PRT4})}{4}$$

Compute the blackbody radiance:

$$T_{BB}^* = A + BT_{BB}$$

$$N_{BB} = \frac{c_1 \nu_e^3}{e^{\frac{c_2 \nu_e}{T_{BB}^*}} - 1}$$

Compute the Earth view radiance using the nonlinearity correction:

$$N_{LIN} = N_S + (N_{BB} - N_S) \frac{(C_S - C_E)}{(C_S - C_{BB})}$$

$$N_{COR} = b_0 + b_1 N_{LIN} + b_2 N_{LIN}^2$$

$$\begin{aligned} N_E \\ = N_{LIN} + N_{COR} \end{aligned}$$

Convert Earth view radiance to equivalent blackbody temperature:

$$T_E^* = \frac{c_2 \nu_c}{\ln \left[ 1 + \left( \frac{c_1 \nu_c^3}{N_E} \right) \right]}$$

$$T_E = \frac{T_E^* - A}{B}$$

## 7.2 HIRS/3

For each internal target PRT, the averaged counts are transformed to temperatures by a quadratic relation. The four temperatures, or those that are deemed to be operating properly, are averaged.

For each thermal channel (1-19, or all telemetry channels except number 12) the blackbody radiance can be computed from the Planck relation,

$$r = \frac{c_1 \nu^3}{\left[ \exp \left( \frac{c_2 \nu}{T^*} \right) - 1 \right]}$$

using central wavenumbers,  $\Lambda$ , computed prior to the launch of the satellite, and an "apparent" temperature defined by

$$T^* = b + c T$$

where b and c are channel dependent coefficients (the so-called band-correction coefficients) computed before the launch of the satellite, and T is the averaged temperature of the internal target. The two constant terms in the Planck relation is  $c_1 = 1.1910659 \times 10^{-5} \text{ mW}/(\text{m}^2\text{-sr-cm}^{-4})$  and  $c_2 = 1.438833 \text{ cm-K}$ .

During the calibration cycle, the counts for the space and internal target views are each averaged, using a  $3\sigma$  throw out criterion, over the range of the 56 measurements deemed to be free from scan mirror movement and other unsatisfactory conditions. If any positions are systematically deleted from one, they will also be deleted from the other.

Assuming that radiance can be related to counts through the quadratic:

$$r = a_0 + a_1 C_\Lambda + a_2 C_\Lambda^2$$

where r is radiance,  $C_v$  is the output in counts from the view, and  $a_0$ ,  $a_1$  and  $a_2$  are constants. Before launch,  $a_2$  is computed and the assumption is made that this is an unchanging characteristic of the channel.

Now the coefficients  $a_0$  and  $a_1$  can be determined. Equation 7.2-3 is applied to the views of space and the internal target, yielding:

$$0 = a_0 + a_1 C_\Lambda + a_2 C_\Lambda^2 \quad (7.2-3)$$

and

$$r_b = a_0 + a_1 C_b + a_2 C_b^2, \quad (7.2-5)$$

where  $C_s$  and  $C_b$  are the mean counts from the views of space and the internal target, respectively, and  $r_b$  is the radiance of the internal target. Or, since  $a_2$  is known,

$$-a_2 C_s^2 = a_0 + a_1 C_s \quad (7.2-6)$$

$$r_b - a_2 C_b^2 = a_0 + a_1 C_b \quad (7.2-7)$$

Then the slope and intercept become:

$$a_1 = \frac{[r_b - a_2(C_b^2 - C_s^2)]}{(C_b - C_s)} \quad (7.2-8)$$

$$a_0 = -a_2 C_s^2 - a_1 C_s \quad (7.2-9)$$

Nominally, the slope and the intercept can be determined from simultaneous views of space and the internal blackbody source. As discussed below, only the intercept varies appreciably

throughout an orbit, the linear and quadratic terms being essentially constant.

The HIRS/3 instrument measures all radiation falling on the detector. That is, it is a total radiometer. To minimize false fluctuations in the signals, the instrument temperature is carefully controlled, so that most optical components experience temperature changes very slowly with respect to the times between calibration cycles (256 seconds). However, the baffle (identified as the secondary mirror) is a blackened light material which is subject to short-term temperature changes from emission or blackbody radiation and absorption of incident radiation from the internal blackbody source (about 280 K), space (2.73 K), and the variable earth views (about 200-275 K plus reflected sunlight). The result is that the contribution by the baffle affects all measurements on a time scale of seconds and this must be accounted for.

At every line, the secondary mirror temperature is linearly interpolated to the midpoint of the radiometric data (beam position 28.5) according to:

$$T_{snn}' = T_{snn-01} + 0.4609(T_{snn} - T_{snn-01}) \quad (7.2-10)$$

where nn is the line number in the superswath (00 to 39), nn-01 is the previous line, and  $T_s$  is the measurement of the secondary mirror temperature. In the first line of an orbit the value

$$T_{snn}' = T_{snn} - 0.5391(T_{snn+1} - T_{snn})$$

is used. The interpolated values are preserved during the processing of a superswath (40 values plus the value from the last line of the previous superswath).

It is assumed that the slopes do not change appreciably over a 24-hour period, varying only about one part in 8000 throughout an orbit. During each 24 hours, the slopes are saved (about 19 times 350 values) and are averaged,

$$\overline{a_{100}}'' = \frac{1}{N} \sum_{i=1}^{i=N} a_{li} \quad (7.2-12)$$

where N is the number of slopes, i is an index, and  $a_1$  is a slope defined in Eq. 7.2-8. A  $3\sigma$  throw-out criterion is used. After the average is computed, the accumulated slopes are purged. The averaged values are used during the next 24 hours, during which a new group of slopes is accumulated (a rotating file is undesirable).

To account for variations in the temperature of the telescope baffle, the intercepts at the time of the calibration are related to the baffle temperature through the relation:

$$a_{000} = b_0 + b_1 T_{s00}' \quad (7.2-13)$$

where  $T_{s00}'$  is the interpolated secondary mirror (baffle) temperature in line 00 (space view). The constants  $b_0$  and  $b_1$  are evaluated when this equation is solved by least squares from intercepts and interpolated secondary mirror temperature accumulated during 24 hours (about 350 values of each), using a  $3\sigma$  throw-out criterion. Only the term  $b_1$  is used hereafter. It is applied during the following 24 hours.

At each calibration cycle, intercepts are recomputed from the mean space counts and the averaged slopes,

$$a_{000}'' = -\overline{a_{100}''} C_{s00} - a_2 C_{s00}^2 \quad (7.2-14)$$

where the value  $a_{000}''$  is used at the time of the space view,  $\overline{a_{100}''}$  is the mean slope, and  $C_{s00}$  is the mean of the space counts in line 00.

Only the averaged slopes are applied to the earth-viewing data. The intercepts must be interpolated between calibration cycles by using the secondary mirror temperature:

$$a_{0nn}'' = a_{000}'' + nn \frac{(a_{040}'' - a_{000}'')}{40} + b_1 \left[ (T_{snn}' - T_{s00}') - \frac{nn (T_{s40}' - T_{s00}')}{40} \right] \quad (7.2-15)$$

where  $nn$  is a scan line number in a superswath numbered 00-39;  $nn = 40$  refers to  $nn = 00$  of the next superswath.

For partial superswaths at the start and end of an orbit the intercepts are computed according to

$$a_{0nn}'' = a_{0xx}'' + b_1 (T_{snn}' - T_{sxx}') \quad (7.2-16)$$

where the subscript  $xx$  refers to the nearest calibration cycle ( $xx = 40$  or  $00$ , respectively).

The initial values of  $b_1$  immediately after launch will be derived from current data from another satellite or will be zeroes (optional). The initial values of the mean slopes immediately after launch will be from another satellite or from data for a single orbit (optional). Data in the Level 1b files derived from use of these initial data will be excluded from the archive; that is, they will be excluded for at least 24 hours after processing begins.

The HgCdTe detector used in the HIRS/3 instrument operates in the photoconductive mode and is slightly nonlinear in its response to radiative flux. Adjustments for nonlinear response are made in Eqs. 7.2-8, 7.2-9, and 7.2-14. The coefficients  $a_2$  are computed from test data taken by the fabricator of the instrument, and will not change throughout the lifetime of the instrument. The combined coefficients will be saved in the Level 1b data and will be applied to earth

measurements.

In summary, for the thermal channels:

a. During an orbit, accumulate

(1) The Channel 1-19 radiances for the blackbody temperatures at the time of the internal target views,

(2) The means and standard deviations of the space counts and the blackbody counts (in scan lines 00 and 01) for each channel, and

(3) The interpolated secondary mirror temperatures (Eqs. 7.2-10 and 7.2-11).

b. Compute the slopes and intercepts from the radiances and counts in according to Eqs. 7.2-8 and 7.2-9. Save both coefficients in temporary 24-hour files, along with the interpolated secondary mirror temperatures.

c. Once per day, compute the relation between intercepts and secondary mirror temperatures from a least-squares solution to Eq. 7.2-13, using a  $3\sigma$  throw-out criterion.

d. Once per day, compute the average slopes over the previous 24-hour period, using a  $3\sigma$  throw-out criterion. These are the slopes to be used during the subsequent 24 hours. After steps c. and d., the accumulated slopes will be purged.

e. Recompute the intercepts according to Eq. 7.2-14 at the time of the space views,  $n = 00$ .

f. Return to the start of the orbit or superswath and interpolate (which requires the recomputed intercept at the next space view) or extrapolate the intercepts for the times of the earth views (lines 02-39) according to Eqs. 7.2-15 or 7.2-16. Note that the starting point for all coefficients is line 00. For an incomplete superswath at the start of an orbit, the reference is line 40 (line 00 of the second superswath).

g. Compute earth-viewed radiances according to Eq. 7.2-3.

The calibration coefficients for Channel 20 (telemetry Channel 12) will be furnished by the fabricator of the instrument and will not change during the lifetime of the satellite.

The mean slopes, the interpolated intercepts, and the quadratic term will be the calibration coefficients appended to scan lines 02-39 of the Level 1b data; the 00 line will have zeroes; and line 01 will have the slope and intercept computed at the time of the calibration,  $a_{000}$ " (Eq. 7.2-14). Data encompassing a flagged calibration cycle (the preceding and current superswaths) are considered to be unusable, the calibration coefficients in lines 02-39 will be set to zero, and the Level 1b data will be properly flagged as unusable.

Logical records of Level 1b data will contain an even number of 8-bit bytes, and all logical records in the archive, regardless of purpose, will be the same length.

### 7.3 AMSU-A and AMSU-B

The Advanced Microwave Sounding Unit-A (AMSU-A) is a fifteen-channel total power microwave radiometer in two separate units: A1 and A2. The AMSU-A2, which has its own antenna system, contains Channels 1 and 2 at 23.8 and 31.4 GHz, respectively. The AMSU-A1, which consists of the two antenna systems A1-1 and A1-2, contains Channels 3-14 in the range of 50.3 - 57.29 GHz and Channel 15 at 89.0 GHz. Between the two antenna systems, A1-2 provides Channels 3, 4, 5, and 8 whereas A1-1 furnishes Channels 6, 7, and 9-15. Each of the AMSU-A antenna systems is required to have a nominal field-of-view (FOV) of 3.3 degrees  $\pm 10\%$  at the half-power points and covers a crosstrack scan of  $\pm 48$  degrees 20 minutes (to beam centers) from the nadir direction with 30 Earth FOVs per scan line. The data received from the spacecraft will contain separate telemetry for each antenna system. Once every 8 seconds, the AMSU-A measures 30 Earth views, the space view twice and the internal blackbody target twice. Combination of Gunn diode cavity-stabilized and phase-locked loop oscillators (PLLO) are used to provide channel frequency stability. Channels 9-14 have both primary and secondary phase-locked loop oscillators (called PLLO#1 and PLLO#2, respectively) built-in. The PLLO#2 will be used for backup if the PLLO#1 fails. Gunn diode oscillators are used in other channels without backups. The output signals of these radiometric samples are digitized by 15-bit analog-to-digital converters.

The AMSU-B is a five-channel total power microwave radiometer with two channels centered nominally at 89 GHz and 150 GHz, and the other three centered around the 183.31 GHz water vapor line with double-sideband centers located at  $183.31 \pm 1$ ,  $\pm 3$ , and  $\pm 7$  GHz, respectively. AMSU-B has a FOV of 1.1 degrees  $\pm 10\%$ , and once every 8/3 seconds it measures 90 Earth views, four space views and four internal blackbody target views.

The calibration procedures for the AMSU-A and AMSU-B are the same, except a few minor differences to allow for the separate antenna systems. Table 7.3-1 lists the main differences between the AMSU-A and AMSU-B procedures. Radiances for both AMSU-A and -B Earth views are derived from the measured counts and the calibration coefficients inferred from the internal blackbody and space view data. Both AMSU-A and AMSU-B were tested and calibrated in T/V chambers before launch and the scanings of both instruments are synchronized to an 8-second pulse. Each instrument has four options for the viewing direction of the space view which can be selected by ground command, and one will be chosen immediately after launch. Note: The Calibration Parameters Input Data Sets (CPIDS) are included in the Header Records of Level 1b data according to the Header Record Format.

<b>Table 7.3-1. Differences between the AMSU-A and AMSU-B procedures</b>			
Items	AMSU-A	AMSU-B	Remarks

	A1-1	A1-2	A2		
Number of PRTs in each warm target	5	5	7	7	Internal black body targets
Number of Earth views per scan line	30	30	30	90	In-orbit
Blackbody and space samples	2	2	2	4	Per scan line
Definition of instrument temperature	RF Shelf A1-1	RF Shelf A1-2	RF Shelf A2	Mixer temp. of Ch. 18-20	Available in housekeeping
Backup of instrument temperature	RF Mux A1-1	RF Mux A1-2	RF Mux A2	Mixer temp of Ch. 16	See Note 1.
Secondary PLLO	Ch. 9-14	NO	NO	NO	Backup PLLO

Note 1: These temperatures (available in the housekeeping data) will be used as backups if the primary ones fail.

### 7.3.1 BLACKBODY TEMPERATURE

The physical temperatures of the internal blackbody targets are measured by Platinum Resistance Thermometers (PRTs). The number of PRTs used to measure the physical temperatures of the internal blackbody targets in each antenna system is given in Table 7.3-1. These PRTs, which were calibrated by individual manufacturers against ‘standard’ ones traceable to NIST, measure temperatures of the internal blackbody targets with an accuracy of  $\pm 0.1\text{K}$ . The outputs to the telemetry are PRT counts, which must be converted to PRT temperatures. The normal approach for deriving the PRT temperatures from counts is a two-step process, in which the resistance of each PRT (in ohms) is computed by a count-to-resistance look-up table provided by its manufacturer. Then, the individual PRT temperature (in degrees) is obtained from an analytic PRT equation. However, this can be compressed to a single step with negligible errors.

This single step process, which will be used with the NOAA KLM satellites, computes the PRT temperatures directly from the PRT counts, using a polynomial of the form

$$T_k = \sum_{j=0}^3 f_{kj} C_k^j \quad (7.3.1-1)$$

where  $T_k$  and  $C_k$  represent the temperature and count of the PRT. The coefficients,  $f_{kj}$ , will be provided for each PRT. Equation 7.3.1-1 is also used for other housekeeping temperature sensors, such as the mixers, the IF amplifiers and the local oscillators.

The mean blackbody temperature,  $T_w$  is a weighted average of all PRT temperatures:

$$T_w = \frac{\sum_{k=1}^m w_k T_k}{\sum_{k=1}^m w_k} + \Delta T_w \quad (7.3.1-2)$$

where  $m$  represents the number of PRTs for each antenna system as listed in Table 7.3-1. The  $w_k$  is the weight assigned to each PRT and  $\Delta T_w$  is the warm load correction factor for each channel derived from the T/V test data for three instrument temperatures (low, nominal, and high). Values for  $\Delta T_w$  will be provided for each instrument. For AMSU-A1-1,  $\Delta T_w$  values for both PLLO#1 and PLLO#2 will be provided. The  $w_k$  value, which equals 1 (0) if the PRT is determined good (bad) before launch, will be provided for each flight model. If any of the PRT temperatures,  $T_k$ , differs by more than 0.2K from its value in the previous scan line, then the  $T_k$  should be omitted from the average in Equation 7.3.1-2.

Similarly, a cold space temperature correction,  $\Delta T_c$ , is also provided for processing the in-orbit data. This is due to the fact that the space view is contaminated by radiation which originates from the spacecraft platform and the Earth's limb. Thus, the effective cold space temperature is given by,

$$T_c = 2.73 + \Delta T_c \quad (7.3.1-3)$$

where 2.73K is the cosmic background brightness temperature. The  $\Delta T_c$ , which represents the contribution from the antenna side lobe interference with the Earth limb and spacecraft, is estimated initially for individual channels, but its optimal value will be determined from post-launch data analysis.

### 7.3.2 CALIBRATION COUNTS

For each scan, the blackbody counts  $C_w$  are the averages of two (four) samples of the internal black body in AMSU-A (AMSU-B). If any two samples differ by more than a preset limit of blackbody count variation  $\Delta C_w$  (the initial limit is set to  $3\sigma$ , where the standard deviation,  $\sigma$ , is calculated from the pre-launch calibration data  $C_w$  for each channel), the data in the scan should not be used.

Similarly, the space counts  $C_c$  are the average of two (four) samples of the space view for AMSU-A (AMSU-B). If any two space view samples differ by more than the preset limit, the data in the scan should be excluded.

To reduce noise in the calibrations, the  $C_x$  (where  $x = w$  or  $c$ ) for each scan line will be convoluted over several neighboring scan lines according to a weighting function:

$$\overline{C_x} = \frac{1}{n+1} \left[ \sum_{i=-n}^n \left( 1 - \frac{|i|}{n+1} \right) C_x(t_i) \right], \text{ counts} \quad (7.3.2-1)$$

the time of the current scan line, one can write  $t_i = t_0 + i\Delta t$ , where  $\Delta t = 8$  seconds for AMSU-A and  $8/3$  seconds for AMSU-B. The  $2n+1$  values are equally distributed about the scan line to be where  $t_i$  (when  $i \neq 0$ ) is the time of the scan line just before or after the current scan line. If  $t_0$  is calibrated. For both AMSU-A and AMSU-B, the value of  $n=3$  is recommended.

For the first and the last three scan lines in a file, the convolution of  $C_x$  should be omitted and the counts  $C_x$  from the individual scan line will replace  $\overline{C_x}$ . In the case of missing scan lines in the  $2n+1$  interval, any one of the remaining scan lines can be selected to replace the missing one(s) in the convolution of  $C_x$ . If the gap of missing scans is larger than  $2n+1$  (i.e., 7), the convolution process must be terminated at the beginning of the gap and starts anew at the end of the gap.

### 7.3.3 EARTH VIEW RADIANCES

The following calibration algorithm, which takes into account any nonlinear contribution due to an imperfect square law detector, is employed to convert observed Earth-viewing counts to radiances:

$$R_s = R_w + \frac{C_s - \overline{C_w}}{G} + Q, \frac{mW}{m^2 - sr - cm^{-1}} \quad (7.3.3-1)$$

where  $R_s$  is the scene radiance and  $R_w$  and  $R_c$  are the Planck radiances corresponding to the blackbody temperature  $T_w$  and the effective cold space temperature  $T_c$  defined in Equations 7.3.1-2 and 7.3.1-3, respectively. The  $C_s$  is the radiometric count from the scene (Earth) target. The averaged blackbody and space counts,  $\overline{C_w}$  and  $\overline{C_c}$ , are defined by Equation 7.3.2-1. The channel gain  $G$  and the quantity  $Q$ , which contains the quadratic contributions, are given by:

$$G = \frac{\overline{C_w} - \overline{C_c}}{R_w - R_c}, \frac{\text{counts}}{mW / (m^2 - sr - cm^{-1})}$$

and

$$Q = u \frac{(C_s - \overline{C_w})(C_s - \overline{C_c})}{G^2}, \frac{mW}{m^2 - sr - cm^{-1}} \quad (7.3.3-3)$$

where u is a predetermined parameter which will be provided at three principal (or backup) instrument temperatures. The u values at other instrument temperatures will be interpolated from these three principal (or backup) values. For channels 9 through 14 (AMSU-A1-1) two sets of the u parameters are provided; one set is for the primary PLL0#1 and the other one for the secondary PLL0#2. The quantity G varies with instrument temperature, which is defined in Table 7.3-1.

For channels 19 and 20 of AMSU-B, the monochromatic assumption breaks down (e.g. channel 20 spans 16 GHz) and a band correction with two coefficients (b and c) has to be applied. These coefficients modify  $T_w$  to give an effective temperature  $T_w'$

$$T_w' = b + cT_w$$

which is then used in the Planck function  $B(T_w')$  to calculate the radiances for channels 19 and 20. Radiances for all other channels (in both AMSU-A and -B) are computed from  $B(T_w)$ . The application of Equation 7.3.3-4 is not necessary for the space temperature since the errors in the monochromatic assumption are negligible for such low radiances. For simplification of application, Equation 7.3.3-1 can be rewritten as,

$$R_s = a_0 + a_1 C_s + a_2 C_s^2, \frac{mW}{m^2 - sr - cm^{-1}} \quad (7.3.3-5)$$

The coefficients  $a_i$  (where  $i=0, 1$  and  $2$ ) can be expressed in terms of  $R_w$ ,  $G$ ,  $\overline{C_w}$  and  $\overline{C_c}$ . This can be accomplished by rewriting the right-hand side of Equation 7.3.3-1 in powers of  $C_s$  and equates the  $a_i$ 's to the coefficients of same powers of  $C_s$ . The results are:

$$a_0 = R_w - \frac{\overline{C_w}}{G} + u \frac{\overline{C_w C_c}}{G^2}, \frac{mW}{m^2 - sr - cm^{-1}} \quad (7.3.3-6)$$

$$a_1 = \frac{1}{G} - u \frac{\overline{C_c} + \overline{C_w}}{G^2}, \frac{mW}{(m^2 - sr - cm^{-1})count} \quad (7.3.3-7)$$

and

$$a_2 = u \frac{1}{G^2}, \frac{mW}{(m^2 - sr - cm^{-1})count} \quad (7.3.3-8)$$

These calibration coefficients will be calculated for every scan line at each channel and appended to the Level 1b data. With these coefficients, Equation 7.3.3-5 can be used to obtain the scene radiance  $R_s$ . It should be noted that the coefficients defined in Equations 7.3.3-6 to 7.3.3-8 are functions of instrument temperature. Therefore, they are, in general, not constant and should be recalculated for each scan. Users who prefer brightness temperature instead of radiance, can make the simple conversion,

$$T_s = B^{-1}(R_s) \quad (7.3.3-9)$$

where  $B^{-1}(R_s)$  is the inverse of the Planck function for a radiance  $R_s$ . The  $T_s$  is the corresponding brightness temperature (or radiometric temperature). However, the conversion (Equation 7.3.3-9) is not performed in the NOAA Level 1b data. Note that for AMSU-B channels 19 and 20 the band correction coefficients must also be applied as follows:

$$T'_s = \frac{T_s - b}{c} \quad (7.3.3-10)$$

where  $T'_s$  corresponds to the brightness temperature of channel 19 or 20.

#### 7.3.4 POST LAUNCH EVALUATION AND CALIBRATION

The procedures and formulas described in the above sections were primarily derived from the pre-launch analysis of the AMSU-A and -B calibration data from T/V chambers. Post launch evaluation and calibration have been extensively carried out with overall favorable results. In one report published by Tsan Mo (1999), the findings showed that the radiometric counts and channel gains correlate linearly with the instrument temperature. The NE(Delta) T values calculated from the AMSU- A 1B data compare favorably to those obtained from the pre- launch test data. All channels on the NOAA-15 AMSU-A have functioned well since its powering up after launch, except Channel 14 which has shown an anomalous behavior since early January 1999. The full report can be accessed from the SPIE Digital Library at <http://proceedings.spiedigitallibrary.org/proceeding.aspx?articleid=994440>.

Numerous products have been created over the years reflecting the success of the AMSU instrument.

### 7.4 SBUV/2

The objective of the calibration program is to achieve a state-of-the-art calibration of the SBUV/2 instrument including response to spectral radiance, response to spectral irradiance, ratio of radiance-to-irradiance responses, and the temperature dependence of response. Continuity of this calibration has been maintained throughout the series.

#### 7.4.1 SBUV/2 CALIBRATION OVERVIEW

Each SBUV/2 instrument consists of a nadir-viewing double monochromator of the Eber-Fastie type, and a cloud cover radiometer (CCR, a filter photometer). A photomultiplier tube detects light exiting the monochromator. They are designed to measure the ratio of backscattered ultraviolet solar radiance to solar irradiance. The SBUV/2 instruments can measure from 152.71 to 443.35 nm in steps of 0.07 nm with a bandpass of 1.1 nm. During normal operation, the backscattered radiance from the nadir is measured at 12 near-UV wavelengths from 252 to 340 nm about 100 times per orbit on the sunlight portion. Light coming into the instrument is first depolarized to remove instrument sensitivity to the polarized backscattered radiances. The CCR makes measurements at 379 nm with a bandpass of 3 nm, and is used to detect scene reflectivity changes during a scan. A diffuser plate is periodically deployed to measure the solar irradiance at the same 12 wavelengths. The instrument is also equipped with a Mercury calibration lamp to monitor both the wavelength scale of the monochromator grating and any degradation of the diffuser.

SBUV/2 instruments use three overlapping gain ranges to measure the solar and Earth radiation which varies over six orders of magnitude. Gain ranges 1 and 2 originate from the photomultiplier anode, while gain range 3 originates from the cathode which allows direct measurement of the instrument's gain. This design differs from SBUV where the anode was the source of all output ranges. For SBUV/2, measurements from the Earth and sun are output on different electronic gain ranges at shorter wavelengths and high solar zenith angles; therefore the instrument's electronic gain is not always canceled in the albedo ratio. The photomultiplier gain (called the interrange ratio, IRR) must be monitored and carefully evaluated over time for accurate long term measurements.

The objective of the calibration program has been to achieve a state-of-the-art calibration of the SBUV/2 instrument including response to spectral radiance, response to spectral irradiance, ratio of radiance to irradiance responses, and the temperature dependence and linearity of the response. Continuity of this calibration has been maintained throughout the series of the operational instruments. Ozone profiles and total amounts are derived from the ratio of the observed backscattered Earth spectral radiance to the incoming solar spectral irradiance. This ratio is proportional to the Earth's geometrical albedo. The only difference in the radiance and irradiance observations is the instrument diffuser used to make the solar irradiance measurement; the remaining optical components are identical. Therefore, the principle changes in the instrument that result in a change in the measured albedo over time are the diffuser reflectivity and the gain range ratios.

#### 7.4.2 COMPONENT CALIBRATION

The spectral efficiency of each optical component of the SBUV/2 instrument is measured by the suppliers in the course of their acceptance testing. This demonstrates that specifications have been met. Also, it allows prediction of the eventual spectral transmittance of the system. If there is a need, the component efficiency tests can be repeated. Monitor (witness sample) mirrors accompany the instrument optics throughout the program and will be periodically tested for spectral reflectivity.

At the subsystem level of assembly, additional procedures and tests are carried out that support

the final calibration. The depolarizer is tested by measuring the residual polarization of initially polarized light after it has passed through the depolarizer. System linearity and dynamic range tests are done before the calibration lamp and diffuser assemblies are installed. Wavelength calibration, bandpass, instrument profile and spectral resolution tests are done with the calibration lamp installed, but before the diffuser assembly is installed. After integration of the complete instrument, but before the formal verification testing begins, a series of checks are run during which final adjustments are made. During this process, the optical alignment is measured and adjusted if necessary, and all field-of-view (FOV) related tests performed, since the same fixture is used for all FOV related tests. FOV test include: size, shape and uniformity of both monochromator and CCR (cloud cover radiometer or photometer) fields and their coincidence. Out-of-band rejection and stray light tests are conducted at this stage. Finally, the first radiance/irradiance response tests are run in air, establishing a baseline to which subsequent tests can be compared.

During environmental testing, after the vibration sequence, the radiance/irradiance response in air is measured and the alignment and FOV checks are made. The definitive radiometric calibration is done just prior to T/V testing. During T/V, the spectral radiometric calibration is extended to the required temperature plateaus and down to 160nm using the Vacuum Test fixture (VTF). The calibration transfer standard sources are returned to NIST for recalibration as necessary to allow the closest possible interpolation between standardizations. During T/V testing, the monochromator wavelength scale change with temperature, if any, is measured.

### 7.4.3 RADIANCE AND IRRADANCE CALIBRATION

In calibrating the Earth Viewing (radiance) mode of operation, the target seen by the instrument is a calibrated reflectance diffuser illuminated by collimated light from a NIST calibrated source of spectral irradiance. The absolute value of the radiance of the test diffuser is a function of the same source irradiance, the efficiencies of the intervening components and their geometries.

In calibrating the radiance-to-irradiance ratio, the set-up is fixed and the test diffuser and the instrument diffuser are alternately placed in the light path. The filter detector monitor measures relative irradiance  $I$  the incoming beam in three broad wavelength bands centered around 180, 250 and 300 nm. If the filter detector monitor and the instrument indicate a decrease in signal from all light sources, the windows and collimating mirrors are checked for efficiency. By swinging the filter detector monitor so that it views the diffuser, a relative efficiency measurement of either diffuser can be obtained. In this way, any changes in the diffusers can be detected during testing. The filter detector monitor uses a quartz windowed bi-alkali photodiode, the type used for the detectors. It is used for relative monitoring measurements only.

The instrument is designed to respond in proportion to the spectral radiance, ( $\text{mW}\cdot\text{m}^{-2}\cdot\text{sr}^{-1}\cdot\Delta^{-1}$ ) incident upon its entrance slit. The area of the entrance slit, the FOV is defined by the field stop, and the bandpass of the monochromator determine the radiant flux,  $M(W)$ , which enters the system. The system transmission efficiency determines the radiance flux at the photocathode. The quantum efficiency and gain of the detector system determine the final response to a given input. To calibrate this system, standard sources of spectral irradiance that will produce a certain

spectral irradiance ( $\text{mW}\cdot\text{m}^{-2}\cdot\text{sr}^{-1}\cdot\Delta^{-1}$ ) at a given distance under carefully controlled conditions are available.

The approach taken is to use a standard (NIST secondary) spectral irradiance to illuminate a diffuser whose bidirectional reflectance distribution function (BDRF) is accurately known. A collimating mirror is used to achieve a uniformity of irradiance and of angle of illumination at the diffuser. Thus, at given angles of view, the spectral radiance of the diffuser is known, and the instrument response to this radiance is measured. The problem is that all three elements (window, collimating mirror and diffuser) have been interposed between the standard source and each introduces changes into the transfer process. The window and collimating mirror can be measured for spectral transmission and reflectance to within 3% to 1 % errors. This is done before and after each major calibration sequence. In addition, the filter detector monitor will indicate any general change in collimator or diffuser efficiency. Extensive experiments and analysis have demonstrated that radiometric calibration are precise to better than 1% ( $2\Phi$ ). The absolute accuracy of the BDRF values is 3%. Non-linearities, wavelength errors and other instrument factors have uncertainties that are less than 1%.

The test diffuser efficiency is measured by direct comparison to a NIST calibrated standard. This is done in the calibration test fixture using the instrument as the detector. A mask in the collimated beam with a 2.5 cm (1 in) aperture will restrict illumination to a small area of the test diffuser. The NIST standard diffuser is moved in from of the test diffuser so that its efficiency is mapped over it surface.

With the standards of irradiance, the collimator and the test diffuser, the instrument is presented with a diffuse source of known radiance against which its response can be calibrated. To calibrate the irradiance mode of operation, the test diffuser is moved out of the way as the instrument diffuser is deployed. In effect, this compares to the efficiencies of the two diffusers, since their interchange is the only difference in the two measurements.

The result of the radiometric calibration is a function that assigns a calibration constant,  $K_E$ , for irradiance to each instrument wavelength,  $\lambda$ , given by:

$$K_E(\lambda) = \frac{E_{dk}(\lambda)}{CC_E(\lambda)} \quad (7.4.3-1)$$

where  $E_{dk}$  is the test fixture irradiance, and  $CC_E$  is the corrected count rate or instrument signal. Similarly, the calibration constant for radiance,  $K_L$ , is given by:

$$K_L(\lambda) = \frac{L_{dk}(\lambda)}{CC_L(\lambda)} \quad (7.4.3-2)$$

where  $E_{dk}$  is the test fixture radiance and  $CC_L$  is the corrected count rate or instrument signal.

Integrating spheres are also used to calibrate the SBUV/2 instruments. Comparison of integrating sphere and diffuser calibrations has shown agreement of about 1% for Space Shuttle SBUV (SSBUV) and SBUV/2.

The SBUV/2 instrument has four viewing modes (nadir Earth, solar diffuser, lamp diffuser, and lamp direct), but only two are used for radiometric calibration. In orbit, the instrument has a nadir view of the Earth in radiance mode. During ground testing, the sensor module views an illuminated target. In the irradiance mode, the sensor module deploys a reflective diffuser, which is illuminated by the Sun during a portion of the orbit. In ground tests, the diffuser is illuminated by a collimated source. The instrument has two major grating modes for collecting radiance and irradiance data. The first is the step scan mode when 12 channels are scanned from 252 to 340 nm in 32 seconds. The second is the continuous scan (160 nm to 405 nm) mode used for solar irradiance and wavelength calibration. So, there are 4 sets of calibration constants, namely: radiance discrete mode, irradiance discrete mode, radiance continuous mode and irradiance continuous mode.

#### 7.4.4 ADDITIONAL INSTRUMENT CALIBRATION

The spectrometric testing and calibration of the monochromator is done as a subsystem in that the diffuser and depolarizer at the front end are installed. The instrument entrance slit is illuminated via an integrating sphere by various intense line sources and the line positions versus grating positions are recorded. One of the sources is the in-flight Mercury calibration lamp. The integrating sphere fills the optical extent of the monochromator for these tests.

Further calibration information is obtained on the diffuser and gain ranges. The brightness of the diffuser varies with wavelength and illumination angle of the source. A series of measurements of FEL lamp and Mercury Pen Ray lamp are made over the range of expected solar illumination and viewing angles to characterize the diffuser goniometry. The interrange ratios are determined by the ratio of counts in two gain ranges when both ranges have valid data. They are observed to vary as a function of wavelength.

Out-of-band errors are measured pre-flight by viewing the diffuse sky or a diffuser illuminated by the sun at the earth's surface. Tests of current instruments resulted in larger responses in the region below 290 nm than the expected signals would produce. Additional measurements to estimate signal to noise, stray light, out-of-field response, alignment, and stability have been made and are presented in various papers since the launch of NOAA-K.

Full details of each instrument's calibrations are presented in the Specifications and Compliance Calibration Data Books (see Ball 1991) prepared by the instrument contractor.

#### 7.4.5 IN ORBIT CALIBRATION

Once in orbit, the SBUV/2 responses are carefully monitored over time. Hilsenrath et al.(1995) have shown that measured albedo relative to the "day 1" albedo over time is a function

of true change in Earth radiance, diffuser degradation, and interrange ratio (PMT gain). Since the primary measurements are ratios, changes in many of the components will cancel. The diffuser plate is used only for the solar irradiance measurements. Accurate characterization of its degradation is required to maintain calibration. This is accomplished by using an on-board Hg calibration lamp. The lamp is alternately viewed directly and indirectly by illuminating the diffuser. Diffuser degradation is monitored at six mercury lines spanning 185 to 405 nm.

The wavelengths associated with the grating positions have been observed to drift. Measurements of the calibration lamp at the six mercury lines, and continuous scans of the solar spectrum (via the diffuser) are used to estimate this drift. Absolute wavelength accuracy can be determined to about 0.02 nm.

The three gain ranges evolve differently over time, and must be periodically renormalized to each other. This can be accomplished by using measurements for which two ranges are valid. The magnitude of the interrange ratios (gain range 2 versus gain range 3) for the SBUV/2 on NOAA-11 decreased by about 15% over its 5 years of operation.

## 7.5 SEM-2

The SEM-2 TED and MEPED are calibrated with proton and electron beams to provide the direct channel responses. Proper instrument operation in-orbit is verified by In-Flight (IFC) cycles, which verify electronic gains, thresholds, channel logic and detector noise levels. The TED particle calibration and IFC operation is described in Section 7.5.1, while the MEPED particle calibration and IFC is described in Section 7.5.2.

### 7.5.1 TED CALIBRATION

#### 7.5.1.1 TED Particle Calibration

The TED ESAs are all calibrated with electron and ion beams to provide measured values for the geometric factors. This corrects for the variations in absolute CDEM detection efficiency, and requires that a unique set of calibration constants for each TED be used in processing the telemetered data. Each TED has a Calibration Report which provides all of the necessary calibration constants.

The primary TED measurements are the electron and proton (ion) energy fluxes measured at 0 and 30 degrees to the local vertical. The energy fluxes are measured for 0.05 to 1 keV and for 1 to 20 keV, so there are 8 primary energy flux values and calibration constants. Approximate values for the conversion of telemetered energy flux counts into energy are listed in Table 7.5.1.1-1. Note that the 8-bit telemetry count is a compressed count, and must first be converted into an uncompressed count. The actual calibrated constants for a given TED may differ by as much as 50% from the values listed in Table 7.5.1.1-1.

<b>Table 7.4.1.1-1. Nominal Values for TED Energy Flux Calibration Factors.</b>				
<b>Channel Designation</b>	<b>Particle Type</b>	<b>Direction Measured</b>	<b>Energy Range (keV)</b>	<b>Calibration Factor (erg/(cm<sup>2</sup>-s-sr-count))</b>

0EFL	Electrons	0	0.05 - 1	$2 \times 10^{-6}$
0EFH	Electrons	0	1 - 20	$5 \times 10^{-5}$
3EFL	Electrons	30	0.05 - 1	$2 \times 10^{-6}$
3EFH	Electrons	30	1 - 20	$5 \times 10^{-5}$
0PFL	Protons (Ions)	0	0.05 - 1	$1 \times 10^{-6}$
0PFH	Protons(Ions)	0	1 - 20	$4 \times 10^{-5}$
3PFL	Protons (Ions)	30	0.05 - 1	$1 \times 10^{-6}$
3PFH	Protons(Ions)	30	1 - 20	$4 \times 10^{-5}$

The TED also provides four point energy spectra and a measurement of the peak flux point in the spectrum for each particle type/measurement direction. The four point spectra require a total of 16 calibration constants to convert the telemetered counts, after decompression, into particle energy fluxes. The peak flux channel can be any of the 16 channels measured for a given particle type/measurement direction, and requires the full set of channel calibration factors, a total of 64 constants. These calibration constants are obtained from the Calibration Report for the TED, and may vary by 50% from the nominal values.

#### 7.5.1.2 TED In-Flight Calibration

Each of the eight CDEMs has a threshold set to one of four values with each design value twice the previous one, as shown in Table 7.5.1.2-1.

<b>Level</b>	<b>Binary Level</b>	<b>Designed Value Voltage</b>
0	00	0.2375 V
1	01	0.475 V
2	10	0.950 V
3	11	1.900 V

The threshold rejects low level noise which appears in the signal processing circuitry. Natural signal pulses from the CDEN are normally larger than the highest threshold so any threshold can be used. At the beginning of life, the lowest threshold is used. If noise appears, it can be rejected by choosing a higher threshold. In addition, CDEM gain may down with age. This is expected to show up with the highest threshold where weaker pulses may not be counted. This effect can be corrected by used a higher CDEM operating voltage, selected by ground command.

TED In-Flight Calibration (IFC) starts on command from the ground. Because the IFC changes settings, the settings in use before the IFC starts are remembered and are restored when the TED IFC terminates. Settings commanded from the ground during TED IFC are remembered and are the ones “restored” on termination. TED IFC has two phases, phase 0 and phase 1, both controlled by the DPU.

Phase 0 measures the thresholds using one major frame (32 seconds). This is done with increasing pulses in at the CDEM with the Electrostatic Analyzers (ESAs) turned off so no natural pulses occur. In eight seconds, the calibration pulses rise in a linear series of steps to

2.50 V at the discriminator, exceeding the highest of the four thresholds. This is done four times, once for each of the four thresholds, taking a total of 32 seconds.

Phase1, which starts at the end of Phase 0, measures CDEM detection efficiency. Phase 1 has no calibration pulses but the ESAs are turned back on so that operation is normal except that the thresholds are cycled through their four levels (0,1,2,3,0,...). It runs for about one spacecraft orbit (189 x 32 second major frames = 100.8 minutes). This allows natural pulses to exercise all thresholds thereby testing the CDEMs as well as the signal processing circuitry. A full revolution is used to assure that there will be pulses, most of which appear in the auroral region. Data from this phase of the IFC is used to determine if any CDEMs have degraded, and if any CDEM operating voltage adjustments are required.

## 7.5.2 MEPED CALIBRATION

### 7.5.2.1 MEPED Particle Calibration

The MEPED telescopes are calibrated with proton and electron beams at a number of accelerators, covering the energy range from 20 keV to several MeV. The omnidirectional sensors were calibrated with proton beams over the range of 13 MeV to 153 MeV. The calibrated particle response geometric factors for the telescopes are listed in Table 7.5.2.1-1. Note that the electron channels have a secondary response to protons which has the same geometric factor. The listed geometric factors for particles in the appropriate energy range. The proton channels also have a small response to high energy electrons, which is primarily in the 0P1 and 9P1 channels. The electron geometric factor of the 0P1 and 9P1 channels varies from about  $10^{-7}$  cm<sup>2</sup>-sr at 30 keV to  $10^{-6}$  cm<sup>2</sup>-sr at 100 keV at 300 keV to  $10^{-4}$  cm<sup>2</sup>-sr at 2MeV.

<b>Table 7.5.2.1-1. MEPED Telescope Calibrated Geometric Factors.</b>			
<b>Channel Designation</b>	<b>Particle Type</b>	<b>Detected Energy Range (keV)</b>	<b>Geometric Factor G(cm<sup>2</sup>-sr)</b>
0E1 and 9E1	Electrons	>30	0.0100
0E2 and 9E2	Electrons	>100	0.0100
0E3 and 9E3	Electrons	>300	0.0100
0E1 and 9E1	Protons	210-2700	0.0100
0E2 and 9E2	Protons	280-2700	0.0100
0E3 and 9E3	Protons	440-2700	0.0100
0P1 and 9P1	Protons	30-80	0.0100
0P2 and 9P2	Protons	80-250	0.0100
0P3 and 9P3	Protons	250-800	0.0100
0P4 and 9P4	Protons	800-2500	0.0100
0P5 and 9P5	Protons	2500-6900	0.0100
0P6 and 9P6	Protons	>6900	0.0100

The calibrated proton geometric factors for the four omnidirectional sensor channels are given in Table 7.5.2.1-2, which lists the measured angular responses integrated over the angular range of 0 to 105. This corresponds to the approximate loss + reflected particle cone over the polar caps,

where the omnidirectional sensor measurements of solar proton fluxes are expected to be most important. The omnidirectional sensors have detector energy loss thresholds of 2.5 MeV, which effectively eliminates any response to electrons and electron bremsstrahlung. This produces a nominal upper limit of about 500 MeV for detected protons, which is moderately broad because of energy loss straggling and variations of particle path in the detector with angle position.

<b>Table 7.5.2.1-2. MEPED Omnidirectional Sensor Calibrated Geometric Factors.</b>			
<b>Channel Designation</b>	<b>Particle Type</b>	<b>Detected Energy Range (MeV)</b>	<b>Geometric Factor G(cm<sup>2</sup>-sr)</b>
P6	Protons	16 - > 500	1.50 (See Note 1.)
P7	Protons	35 - > 500	1.50 (See Note 1.)
P8	Protons	70 - > 500	1.50 (See Note 1.)
P9	Protons	140 - > 500	1.50 (See Note 1.)
<b>Note:</b>			
1. Geometric factors integrated over the angle range of 0 to 105, which includes most of the particle-filled cone over the Polar caps.			

The thresholds and combinatorial logic with determine the various particle energy channels are calibrated for each MEPED using radioactive sources with precise x-ray energies. The telescope detectors are calibrated against the 59.54 keV x-ray from <sup>241</sup>Am, which produces a strong photo-peak in the measured spectrum. This is used to calibrate a precision Pulse Generator, which is then used to calibrate all the threshold levels. The omnidirectional sensor detectors and thresholds are calibrated using the 661.6 keV gamma-ray from <sup>137</sup>Cs, which produces a strong Compton edge at 477.3 keV. This Compton edge is used to calibrate the precision Pulse Generator, which in turn is used to calibrate detector gain and threshold level values. All MEPED detectors are selected to have the same sensitive thickness and detection area, so the calibrated particle responses for all MEPEDs should be identical.

### **7.5.2.2**      MEPED In-Flight Calibration

The MEPED In-Flight Calibration (IFC) is an automatic calibration verification started by command from the ground. Processing the telemetered data gives the energy of each threshold and the full width at half maximum (FWHM) noise for the telescope detectors. After the command, the IFC starts at the next Major Frame sync pulse from the spacecraft. The IFC terminates automatically, but may also be terminated by command. The DPU controls the IFC cycle, which is used to verify all of the electronic gains, threshold values, and coincidence logic for the MEPED.

During the IFC negative pulses at a frequency of 2080 Hz are applied to the front end of each charge-sensitive amplifier. The amplitude (voltage) of the pulses is stepped up in a linear staircase of 0 to 191 steps. Groups of four pulse amplitudes are counted and telemetered, making 48 values received on the ground. The MEPED IFC has two phases, 0 and 1. The pulses are scaled for each detector and IFC phase. Phase 0 measures low energy thresholds and telescope detector noise widths, and phase 1 measures high energy thresholds. The fraction of the maximum count (account of all pulses if the pulse height is well above the threshold) for a given

IFC output is called F. For Phase 0 the variation of F with IFC pulse amplitude is fit with a Gaussian distribution to determine both the threshold value and the detector FWHM noise. For Phase 1 there is generally only one value of F which is between 0 and 1, and this value is used to measure the threshold.

The threshold values used in the MEPED are listed in Table 7.5.2.2-1, which shows which threshold is used for the lower energy determination of the listed particle channels. The IFC Phase used for each threshold measurement is also listed. Note that all telescope thresholds are actually two separate values, one for the 0 telescope and one for the 90 telescope. Thresholds for the “E” channels are for the electron telescopes, while thresholds for the “P” channels are for the proton telescopes.

The actual thresholds are derived from the IFC count data using calibration factors obtained from the calibrated threshold values for each MEPED. The MEPED IFC calibration factors are provided in a Calibration Report for each instrument.

<b>Threshold Designation</b>	<b>Threshold Values (keV)</b>	<b>Particle Channels</b>	<b>IFC Phase</b>	<b>FWHM Noise Measurement</b>
LS1(2 levels)	25.6	0E1 and 9E1	0	Yes
LS2(2 levels)	98.1	0E2 and 9E2	0	Yes
LS3(2 levels)	299.	0E3 and 9E3	1	No
LS4(2levels)	2500.	0E3 and 9E3	1	No
LS1(2 levels)	21.4	0P1 and 9P1	0	Yes
LS2(2 levels)	70.7	0P2 and 9P2	0	Yes
LS3(2 levels)	243.	0P3 and 9P3	1	No
LS4(2 Levels)	796.	0P4 and 9P4	1	No
LS5(2 levels)	2498.	0P5 and 9P5	1	No
LS6(2 levels)	50.	0P6 and 9P6	0	Yes
LS1(omni)	2500	P6	1	No
LS2(omni)	2500	P7	1	No
LS3(omni)	2500	P8	1	No
LS4(omni)	2500	P9	1	No

## **7.6 MICROWAVE HUMIDITY SOUNDER (MHS)**

The launch of NOAA-18 (NOAA-N) on May 20, 2005 presented a new challenge to product production due to a new instrument, the Microwave Humidity Sounder (MHS), which replaced the AMSU-B flown on NOAA-15, -16, and -17 satellites. A major difference between MHS and AMSU-B (both five channel radiometers) is the measurement frequency at channel 2 and channel 5. MHS has 157 GHz and 190 GHz while AMSU-B operates at 150 GHz and 183, +/- 7 GHz.

The MHS has nominal and redundant Platinum Resistance Thermometers (PRTs) built into the

instrument. One set each of five PRTs and three calibration resistors is routed to the telemetry acquisition circuit of the Processor and Interface Electronics A (PIE-A) and PIE-B, respectively. MHS also has nominal and redundant local oscillators, Side-A and Side-B. One of the sets is used for nominal and the other set will serve as backup. A more thorough description of the MHS instrument can be found in Section 3.9.

### 7.6.1 COMPUTATION OF PRT TEMPERATURES

The PRT temperatures are derived in a two-step process. First the PRT counts in the MHS data packets are converted to resistance  $R$  (in ohms) using three reference resistor values which are in the data packets (in counts). Subsequent conversion of PRT resistance  $R$  into PRT temperature is accomplished using a cubic polynomial of the form,

$$T_k = \sum_{j=0}^3 f_{kj} R_k^j \quad (7.6-1)$$

where  $T_k$  and  $R_k$  represent the temperature and resistance of the PRT  $k$ , respectively. The coefficients  $f_{kj}$  will be provided for each PRT. MHS has five PRTs (per PIE) mounted on the underside of the onboard calibration target (OBCT). Each PRT is sampled once per scan and these PRT counts are output in the science data packet. The PRT count must be converted into resistance  $R_k$  which appears in Equation 7.6.1-1. The process of converting the PRT counts into resistance is described in the next section.

### 7.6.2 THREE PRT CALIBRATION CHANNELS

MHS has three PRT calibration channels which provide data for a linear count-to-resistance conversion that is updated in each scan. These are precision resistors whose values are known to high precision over their operating temperatures and life. Their values are chosen to lie at the upper, middle, and lower resistance ranges expected of the OBCT PRTs throughout mission life. These three resistors are referred to as the PRT Calibration channels 1, 2, and 3 (PRT CAL $n$ , where  $n=1, 2, \text{ and } 3$ ), respectively. Their values in counts are measured once per scan and are output in the science data packet. The resistance of the PRT CAL $n$  is assumed to be a linear function of the PRT CAL $n$  counts,

$$R_{CALn} = \alpha + \beta C_{CALn} \quad (7.6.2-1)$$

where  $R_{CALn}$  and  $C_{CALn}$  represent the resistance and count of the PRT CAL $n$ , (with  $n=1, 2, \text{ and } 3$ ) respectively. The  $\alpha$  and  $\beta$  are the offset and slope. For each scan, the  $C_{CALn}$  values are measured and the  $R_{CALn}$  values, which remain constant, are provided for each MHS flight model. Therefore, the  $\alpha$  and  $\beta$  can be obtained by a least-square fit from Equation 7.6.2-1. The results are,

$$\alpha = \frac{\left( \sum_{n=1}^3 R_{CALn} \right) \left( \sum_{n=1}^3 C_{CALn}^2 \right) - \left( \sum_{n=1}^3 C_{CALn} \right) \left( \sum_{n=1}^3 C_{CALn} R_{CALn} \right)}{3 \left( \sum_{n=1}^3 C_{CALn}^2 \right) - \left( \sum_{n=1}^3 C_{CALn} \right)} \quad (7.6.2-2)$$

$$\beta = \frac{3 \left( \sum_{n=1}^3 C_{CALn} R_{CALn} \right) - \left( \sum_{n=1}^3 R_{CALn} \right) \left( \sum_{n=1}^3 C_{CALn} \right)}{3 \left( \sum_{n=1}^3 C_{CALn}^2 \right) - \left( \sum_{n=1}^3 C_{CALn} \right)} \quad (7.6.2-3)$$

### 7.6.3 CONVERSION OF PRT COUNTS INTO RESISTANCE

For each scan, these  $\alpha$  and  $\beta$  values are computed and then applied to each OBCT PRT to convert the OBCT PRT count  $C_k$  into resistance  $R_k$  as follows,

$$R_k = \alpha + \beta C_k \quad (7.6.3-1)$$

where  $R_k$  and  $C_k$  are the resistance and count, respectively, of the PRT  $k$  with  $k=1$  to 5. The  $R_k$  will be used in Equation 7.6.1-1 for calculation of the OBCT PRT temperatures,  $T_k$ , values of which are output to the MHS Level 1b data.

### 7.6.4 BLACKBODY TEMPERATURE

The mean OBCT temperature,  $T_w$ , is calculated from the individual PRT temperatures,

$$T_w = \frac{\sum_{k=1}^m W_k T_k}{\sum_{k=1}^m W_k} + \Delta T_w \quad (7.6.4-1)$$

where  $m=5$  represents the number of OBCT PRTs (as listed in Table 3.9.2.1-2) and  $W_k$  is a weight assigned to each PRT  $k$ . The quantity  $T_w$  represents a warm load correction factor, which is derived for each channel from the pre-launch test data at three instrument temperatures (low, nominal, and high). The procedure for determining the  $T_w$  values is described in Mo (1996). The  $W_k$  value, which equals 1 (0) if the PRT  $k$  is determined good (bad) before or after launch. For the central PRT,  $W_k=2$  will be assigned.

Similarly, a cold space temperature correction,  $\Delta T_c$ , may be required. This is due to the fact that the space view may be contaminated by radiation which originates from the spacecraft and the Earth's limb. Thus, the effective cold space temperature is given by:

$$T_c = 2.73 + \Delta T_c \quad (7.6.4-2)$$

where 2.73K is the cosmic background brightness temperature and  $\Delta T_c$  will be determined from pre- or post-launch data analysis. The  $\Delta T_c$  values of individual channels and each of the possible space viewing directions will be provided for each MHS flight model in Appendix D.

## 7.6.5 MHS HOUSEKEEPING THERMISTORS AND CURRENT MONITORS

### 7.6.5.1 Standard Thermistors

There are 24 Housekeeping (HK) thermistors which monitor the temperatures at various MHS telemetry points, such as amplifiers, and local oscillators. These data, which are primarily for instrument health and safety monitoring, are not used in the radiometric retrieval algorithm of science data. The accuracy of these HK temperatures is less rigorous than that of the PRT temperatures. The 24 HK thermistors use a common set of conversion coefficients. The two-step process of converting counts to resistance and resistance to temperature can be compressed into a single step with negligible errors. This single step process computes the thermistor temperatures directly from the thermistor counts, using a polynomial of the form,

$$T_{th} = \sum_{n=0}^4 g_n C_{th}^n \quad (7.6.5.1-1)$$

where  $T_{th}$  and  $C_{th}$  represent the temperature and count of the thermistors, respectively. The  $C_{th}$  is also referred to as the 8-bit code from the Thermistor Telemetry. The coefficients  $g_n$ , which are valid for  $-40^\circ\text{C}$  to  $60^\circ\text{C}$  (i.e., 243 K to 333 K), will be provided for each MHS flight model in Appendix D.

### 7.6.5.2 Current Monitors

There are six current monitors that measure the current consumption of various power lines in the MHS instrument. The measured output in count  $C_I$  is converted to current,  $I$  (in amperes) by a linear relationship as follows,

$$I = I_0 + mC_I \quad (7.6.5.2-1)$$

where  $I_0$  is the intercept and  $m$  denotes the slope, respectively. Values of  $I_0$  and  $m$  will be provided for each monitor in Appendix D.

### 7.6.5.3 Survival Thermistors

In the MHS analog telemetry, there are three survival thermistors which monitor the temperatures of the Receiver, Electronics Equipment, and Scan Mechanism. These survival

thermistors are powered to provide measurements even when the instrument power is off.

The conversion of the survival thermistor counts into temperatures is accomplished by a polynomial of the form,

$$T_{SUR} = \sum_{m=0}^5 h_m V^m \quad (7.6.5.3-1)$$

where  $V = 0.02 \times \text{Count}$  represents the measured output in volts. One set of coefficients  $h_m$  applies to all three survival thermistors.

### 7.6.6 CALIBRATION ALGORITHM

The calibration algorithm from Mo (1996) that converts the Earth scene counts  $C_s$  to radiance,  $R_s$ , is given as follows,

$$R_s = R_w + (R_w - R_c) \left( \frac{C_s - \overline{C_w}}{\overline{C_w} - \overline{C_c}} \right) + Q \quad (7.6.6-1)$$

where  $R_w$  and  $R_c$  are the radiance computed from the OBCT temperature  $T_w$  and the effective cold space temperature  $T_c$ , respectively, using the Planck function. The  $C_s$  is the radiometric count from the Earth scenes. The  $\overline{C_w}$  and  $\overline{C_c}$  are the convoluted blackbody count and space counts, respectively, as defined in Equation 7.6.6-3 below. The quantity  $Q$ , which represents the nonlinear contribution, is given by,

$$Q = u(R_w - R_c)^2 \frac{(C_s - \overline{C_w})(C_s - \overline{C_c})}{(\overline{C_w} - \overline{C_c})^2} \quad (7.6.6-2)$$

where  $u$  is a free parameter, values of which are determined at three instrument temperatures (low, nominal, and high) from the pre-launch calibration data. After the launch of MHS, the  $u$  value at an actual on-orbit instrument temperature will be interpolated from these three pre-launch values.

For each scan,  $C_w$  represents the mean blackbody radiometric count of the four samples of the blackbody target. Similarly,  $C_c$  represents the mean space radiometric count of the four samples of space viewing. To reduce noise in the calibrations, the  $CX$  (where  $X=W$  or  $C$ ) for each scan line were convoluted over several neighboring scan lines according to a weight function,

$$\overline{C}_x = \frac{\sum_{i=-n}^n w_i C_x(t_i)}{\sum_{i=-n}^n w_i} \quad (7.6.6-3)$$

where  $t_i$  (when  $i \neq 0$ ) represents the time of the scan lines just before or after the current scan line and  $t_0$  is the time of the current scan line. The variable  $t_i$  can be written as:  $t_i = t_0 + i\Delta t$ , where  $\Delta t = 8/3$  seconds for MHS. The  $2n+1$  values are equally distributed about the scan line to be calibrated. Following the NOAA KLM operational preprocessor software, the value of  $n=3$  is chosen for MHS. A set of triangular weights, 1, 2, 3, 4, 3, 2, and 1 are chosen for the weight factor  $w_i$  that appears in Equation 7.6.6-3 for the seven scans at  $i = -3, -2, -1, 0, 1, 2, \text{ and } 3$ , respectively.

For MHS channel 19, the monochromatic assumption breaks down and a band correction with two coefficients has to be applied. These coefficients modify  $T_w$  to give an effective temperature  $T_w'$ :

$$T_w' = b + cT_w \quad (7.6.6-4)$$

which is then used in the Planck function to give an accurate radiance. The application of Equation 7.6.6-4 is not necessary for the space temperature since the errors in the monochromatic assumption are negligible for such low radiance.

### 7.6.7 CALIBRATION QUALITY CONTROL

Quality control (QC) in the MHS calibration is very important for producing accurate calibration coefficients in the NESDIS operational calibration process. A scan-by-scan QC process can detect bad data which are flagged in the Level 1b data sets. All of the QC processes that have been built into the NESDIS operational AMSU-B preprocessor are to be included in this MHS algorithm. These and additional QC items are listed as follows,

**Intra-scan test of blackbody counts  $C_w$ :** If any two samples differ more than a preset limit of the blackbody count variation  $\Delta C_w$ , the  $C_w(t_i)$  should be excluded in Equation 7.6.6-3 by setting  $w_i=0$ .

**Intra-scan test of the space counts  $C_c$ :** If any two samples differ more than a preset limit of the space count variation  $\Delta C_c$ , the  $C_c(t_i)$  should be excluded in Equation 7.6.6-3 by setting  $w_i=0$ .

**Inter-scan test of PRT temperatures  $T_k$ :** If a  $T_k$  differs by more than 0.2K from its value in the previous (good) scan line, the  $T_k$  should be omitted from the average in Equation 7.6.4-1 by setting  $w_k=0$ .

**Test of antenna pointing accuracy:** If an antenna position reading is out of a preset limit, then an error flag will be set in the Level 1b data.

Radio frequency interference (RFI) correction: It was observed that the transmitters on the NOAA KLM spacecraft can produce serious RFI to the AMSU-B data. A corrective algorithm was developed for correction of the RFI in the AMSU-B. The same algorithm will also be used in the MHS calibration algorithm. Detailed description of the AMSU-B RFI corrective algorithm is online in Appendix M.

Detection and exclusion of the Lunar contaminated space samples from the calibration: Calculate the angular separation between the Moon and each viewing direction of the four space samples. Reject those samples that are within a pre-defined angular threshold (default = 1.5°). In the worst case, three samples may be rejected in this process (keep the sample that has the largest separation angle if all four samples fall within the pre-defined angular threshold). Description of how to calculate the angular separation between the Moon and the space viewing direction is given in Kigawa and Mo (2002). Store the calculated separation angles.

Inter-scan test of sudden jump (or drop) of  $C_w$  and  $C_c$ : Such sudden change in  $C_w$  and  $C_c$  has been observed in the NOAA-17 AMSU-A data. A corrective algorithm from Mo (2002) was developed for correction of the effect of such sudden change in the calibration counts on the calibration coefficients.

#### 7.6.8 NOAA LEVEL 1b DATA

The NOAA Polar Orbiter Level 1b data are raw data that have been quality controlled and assembled into discrete data sets, to which Earth location and calibration information are appended but not applied. For simplification of application, Equation 7.6.6-1 can be rewritten as,

$$R_s = a_0 + a_1 C_s + a_2 C_s^2 \quad (7.6.8-1)$$

where the calibration coefficients  $a_i$  (where  $i = 0, 1, \text{ and } 2$ ) can be expressed in terms of  $R_w$ ,  $G$ ,  $\overline{C_w}$  and  $\overline{C_c}$ . This is accomplished by rewriting the right-hand side of Equation 7.6.6-1 in powers of  $C_s$  and equating the  $a_i$ 's to the coefficients of same powers of  $C_s$ . The results are,

$$a_0 = R_w - \frac{\overline{C_w}}{G} + u \frac{\overline{C_w} \overline{C_c}}{G^2} \quad (7.6.8-2)$$

$$a_1 = \frac{1}{G} - u \frac{\overline{C_c} + \overline{C_w}}{G^2} \quad (7.6.8-3)$$

and

$$a_2 = u \frac{1}{G^2} \quad (7.6.8-4)$$

where G represents the channel gain and is defined as

$$G = \frac{\overline{C_w} - \overline{C_c}}{R_w - R_c} \quad (7.6.8-5)$$

These calibration coefficients will be calculated at each scan line for all channels and appended to the Level 1b data. With these coefficients, one can simply apply Equation 7.6.8-1 to obtain the scene radiance  $R_s$ . Users, who prefer brightness temperature instead of radiance, can make the simple conversion,

$$T_s = B^{-1}(R_s) \quad (7.6.5-6)$$

where  $B^{-1}(R_s)$  is the inverse of the Planck function for radiance  $R_s$ . The  $T_s$  is the converted brightness temperature.

For MHS channel 19, the band correction must be taken into consideration in the inverse process as follows,

$$T_s = \frac{B^{-1}(R_s) - b}{c} \quad (7.6.8-7)$$

## 8.0 NOAA LEVEL 1B DATABASE

This section describes the NOAA-KLMNN' and Metop Polar Orbiter Level 1b NOAA datasets archived by NOAA. Also described are the formats in which NOAA distributes raw data to the users.

NOAA Level 1b (following FGGE terminology) is raw data that have been quality controlled, assembled into discrete data sets, and to which Earth location and calibration information have been appended (but not applied). Please note that NASA and EUMETSAT use a different definition for Level 1b, so the following information may not apply to data sets produced by other organizations.

Currently, the NOAA Level 1b data are ingested into the Comprehensive Large Array-data Stewardship System (CLASS) from NSOF and made available to the general public within 4 hours after ingest. Each data set contains data of one type for a discrete time period. Thus, there are separate data sets for HRPT, LAC, GAC, FRAC, HIRS/3, HIRS/4, AMSU-A, AMSU-B, MHS and SEM-2.SBUV/2 data sets do not meet the NOAA Level 1b definition, and are described under Section 9.7, NESDIS Operational Products. Time periods are arbitrary subsets of orbits, and may cross orbits (i.e., may contain data along a portion of an orbital track that includes the ascending node, the reference point for counting orbits). Generally, GAC, FRAC, HIRS/3, HIRS/4, MHS, AMSU-A, and AMSU-B data sets will be available for corresponding time periods and usually have a three to five minute overlap between consecutive data sets.

### 8.1 DATA REPRESENTATION AND STORAGE

This section describes the bit and byte numbering conventions used in this document, and the storage methods for integers and floating point numbers. This information is especially critical when transporting data from one computer architecture to another. Without special handling, data produced on one system may be unusable on another due to differences in internal data storage.

Within this section, a byte is defined as containing 8 bits (i.e., an octet), and a word can be either 8, 16 or 32 bits in length. In all cases, the least significant bit (lsb) is designated as bit 0 and has a base10 value of  $2^0 = 1$ . Therefore, in a 8-bit word, the most significant bit (msb) is designated as bit 7, and has a base-10 value of  $2^7 = 128$ . In a 16-bit word, the msb is designated as bit 15, and has a base-10 value of  $2^{15} = 32,768$ . In a 32-bit word, the msb is designated as bit 31, and has a base10 value of  $2^{31} = 2,147,483,648$ .

- For signed binary integers, the msb represents the sign of the number. The remaining bits (bits 7 through 0 for 8-bit words, 15 through 0 for 16-bit words and 31 through 0 for 32-bit words) are used to designate the magnitude of the number. Therefore, the range of signed binary integers is based on word size as follows:
  - 1 byte -128 to 127
- 2 bytes -32,768 to 32,767
- 4 bytes -2,147,483,648 to 2,147,483,647

Positive binary integers are in true binary notation with the sign bit set to zero. Negative binary integers are in two's-complement notation with sign bit set to one. Negative binary integers are formed in two's-complement notation by inverting each bit of the positive binary integer and adding one.

Unsigned binary integers use all bits including the msb to represent the magnitude of the number. Therefore, their range is as follows, again, based on word size:

- 1 byte 0 to 255
- 2 bytes 0 to 65,535
- 4 bytes 0 to 4,294,967,295

A field containing a binary integer is give the data type of unsigned integer if its content will never be a negative or if a negative value just does not make sense for that field. For example, the idea of a negative scan line number or negative date or time is nonsensical. Therefore, fields containing scan line numbers, dates and times are labeled as unsigned integers.

Unfortunately, this data type is not supported by all computer languages (e.g., FORTRAN), so additional data manipulation may be necessary. In the case of reading a 16-bit unsigned integer (DATA), a FORTRAN user could use the following code snippet to extract the actual value (VALUE):

```
...
INTEGER*2 DATA
INTEGER*4 VALUE
...
READ DATA
IF (DATA .LT. 0) THEN
    VALUE = 65536 + DATA
ELSE
    VALUE = DATA
ENDIF
...
```

But note that nearly all unsigned integer fields can be safely read into signed integer data types of the same word sizes. This is because they were originally written to the Level 1b using signed integer data types, and thus will be within the positive range of the corresponding signed integer data type. The Level 1b format specifications will clearly indicate, by providing ranges, those unsigned integer fields that must be strictly treated as unsigned integer data types - using the data manipulation described above, if necessary - to ensure that correct values are retrieved.

However, not all fields of an unsigned integer data type contain unsigned binary integers. Fields containing packed data are also identified as unsigned integers. While its msb is not a sign bit, a field containing packed data does not represent an unsigned binary integer. Such a field requires

the user to perform some type of special unpacking technique in order to extract the information of interest from the field in order for correct interpretation. Packed data may be bit fields, packed integers, or both. A bit field is one or more consecutive bits used to indicate one of two or more possible conditions or states. (A bit flag is a specialized instance of a bit field. It is a single bit indicating one of only two possible conditions.) For example, a three-bit field may indicate which of seven different modes that an instrument is operating in (i.e., 0 implies “power on mode”, 1 implies “warm up mode”, 2 implies “standby mode”, etc.). A packed integer is simply a binary number that is stored in just a subset of an unsigned integer field’s bits. Although similar to a bit field, a packed integer is not an indicator of a condition, but an actual numeric value having magnitude, that once unpacked, could be used in arithmetic computations.

To provide maximum portability of the Level 1b data sets across different computer platforms, floating point data is represented by scaled integers. Scaled integers can be either signed or unsigned, and are simply floating point numbers multiplied by a fixed scaling factor so that a sufficiently precise representation of the original number can be stored in integer form. For example, the floating point value 1.2313 might be multiplied by  $10^2$  to achieve an integer value of 123. To achieve better precision, the floating point value might be multiplied by  $10^3$  or  $10^4$  to achieve an integer value of 1231 or 12313, respectively. In the Level 1b data sets, the scaling factors are powers of ten, and only the exponents (2, 3 and 4 in the previous examples) are documented within the data set. To recover an approximation of the original floating point value, divide the integer value by ten raised to the given exponent.

A major problem impeding the free transport of binary data from one computer system to another is the “Big Endian - Little Endian” dichotomy. “Big Endian” systems (e.g. IBM 370, Macintosh, SGI, Sun SPARC) store bytes of binary numeric data in reverse order relative to “Little Endian” systems (e.g. IBM PC, DEC Alpha). For example, a 32-bit hexadecimal value of x01020304 (decimal value 16,909,060) written to a binary file by a Big Endian system would be read from the file as x04030201 (decimal value 67,305,985) by a Little Endian system. Level 1b data sets generated and archived by NOAA are in Big Endian order; users with Little Endian systems must include an additional byte-swapping step when reading binary numeric data from Level 1b data sets produced by NOAA. Some processors support byte swapping in their instruction sets, but others must use compiler dependent functions.

## **8.2 NOAA LEVEL 1B DATA SET NAMES**

This section describes the data set naming convention which is used for all NOAA Level 1b data sets. Each data set has a unique data set name which is generated when the data set is created. This 42-character name will be used to reference the data sets. The data set name is composed of a set of alphanumeric qualifiers separated by periods (.). The complete data set name with all of its qualifiers will be as follows:

PROCESSING-CENTER.DATA-TYPE.SPACECRAFT-UNIQUE-ID.YEAR-DAY.START-TIME.STOP-TIME.PROCESSING-BLOCK-ID.SOURCE

The qualifiers of the data set name are defined in Table 8.2-1:

<b>Table 8.2-1. NOAA Level 1b Data Set Names.</b>	
<b>Qualifier</b>	<b>Example</b>
PROCESSING CENTER	<p>Three characters identifying where the data set was created. Recognized character groups are:</p> <p>CMS = Centre de Meteorologie Spatiale - Lannion, France            DSS = Dundee Satellite Receiving Station - Dundee, Scotland, UK            NSS = NOAA/NESDIS - Suitland, Maryland, USA            UKM =United Kingdom Meteorological Office - Bracknell, England, UK</p>
DATA TYPE	<p>Four characters identifying the data type and transmission method. Recognized character groups are:</p> <p>HRPT= HRPT (direct readout full resolution AVHRR)            GHRR= GAC (recorded reduced resolution AVHRR)            LHRR= LAC (recorded HRPT AVHRR)            FRAC=FRAC (recorded full resolution, full orbit data from Metop)            HIRX= HIRS/3 or HIRS/4 data set derived from GAC embedded TIP            AMAX= AMSU-A data set derived from GAC embedded TIP            AMBX= AMSU-B data set derived from GAC embedded TIP            MHSX=MHS data set derived from AIP            MHSS=MHS data derived from stored AIP            MHSH=MHS data derived from HRPT            HIRS= HIRS/3 or HIRS/4 data set derived from stored TIP            AMAS= AMSU-A data set derived from stored TIP            AMBS= AMSU-B data set derived from stored TIP</p>
SPACECRAFT UNIQUE ID	<p>Two characters identifying the spacecraft platform from which the data was received. Recognized character groups are:</p> <p>NK = NOAA-15 (formerly NOAA-K, launched 13 May 1998)            NL = NOAA-16 (formerly NOAA-L, launched 21 September 2000)            NM = NOAA-17 (formerly NOAA-M, launched 24 June 2002)            NN = NOAA-18 (formerly NOAA-N, launched 20 May 2005)            NP = NOAA-19 (formerly NOAA-N', launched 6 February 2009)            M2 = Metop-A (European satellite launched 19 October 2006)            M1 = Metop-B (European satellite launched 17 September 2012)</p>
YEAR DAY	<p>Six character date identification field in the form XYYDDD, where "X" is a delimiter, "YY" identifies the year of century and "DDD" identifies the day of the year on which the spacecraft began recording the data set. Example: D14100 for day 100 of year 2014</p>

START TIME	S1355, where "S" identifies this group as a start time delimiter. "1355" denotes 13 hours 55 minutes UTC (to the nearest minute) and represents the time at which spacecraft recording began.
STOP TIME	E1456, where "E" identifies this group as an end time delimiter. "1456" denotes 14 hours 56 minutes UTC (to the nearest minute) and denotes the time of spacecraft recording of the last usable data in the data set.
PROCESSING BLOCK ID	B0016465, where "B" identifies this group as a processing block ID delimiter. "0016465" is a seven digit number identifying the spacecraft revolution in which recording of this data set began and the revolution in which the data ended (the first five digits identifying the beginning revolution and last two being the two least significant digits of the orbit number identifying the ending revolution).
SOURCE	Two characters identifying data acquisition source. Valid character groups are: CF - Cape Ferguson, Queensland, Australia DU = Dundee, Scotland, UK EB - Ewa Beach, Oahu, Hawaii GC = Fairbanks, Alaska, USA (formerly Gilmore Creek) HO = Honolulu, Hawaii, USA MI = Miami, Florida, USA MM = McMurdo, Antarctica MO = Monterey, California, USA SF = Sioux Falls, South Dakota, USA SN = Svalbard NOAA, Norway SO = Satellite Operations Control Center, Suitland, Maryland, USA SV= Svalbard, Norway WE = Western Europe, Lannion, France WI = Wallops Island, Virginia, USA

### 8.3 DATA DISTRIBUTION FORMATS

This section describes the digital data formats which NOAA/NESDIS uses to distribute data from the NOAA Level 1b database.

#### 8.3.1 NOAA LEVEL 1B (NATIVE) FORMAT AND SELECTIVE EXTRACTS

This section describes the NOAA Level 1b digital data format. This includes the data formats archived by NOAA/NESDIS and distributed to near-realtime users, and the formats produced by NESDIS archive retrieval systems for customers of retrospective data (data older than 4 hours).

The archive format versions have changed several times over the lifetime of the NOAA KLMNN” series satellites. These changes were applied across all datatypes and across all operational satellites at the same time. The change dates are summarized below.

- Version two (v2) formats were in effect from the launch of NOAA-15 on May 13, 1998, to April 27, 2005.
- Version three (v3) formats were in effect from April 28, 2005, just prior to launch of NOAA-18, through January 24, 2006.
- Version four (v4) formats were in effect from January 25, 2006 to end-of-life.

Version two was applied to NOAA-15, NOAA-16, and NOAA-17. Version three was applied to all POES satellites from NOAA-15 through NOAA-18 to improve HIRS calibration. Version four was applied to all POES satellites from NOAA-15 through NOAA-19 and, also, to Metop-A and Metop-B to include pixel level cloud information from the **CL**ouds from **AVHRR** Extended (**CLAVR-x**) program. A flag was added to the header record (utilizing spares) that indicated when the CLAVR-x processing is actually turned on or off. The CLAVR-x cloud mask is stored as a 2-bit value for each pixel.

On November 14, 2006, at 1531 UTC the HRPT/LAC 1B version number was inadvertently changed to 5. This occurred when a problem fix was implemented to correct a zero scan line number that was in the Metop-2/A FRAC data. There were no format changes associated with this fix.

### 8.3.1.1 Data Set Structure

The record structure of each data set (file) as archived by NOAA and provided directly to near-realtime users is shown below:

Record 1:	Data Set Header Record
Record 2 - EOF:	Data Records

The Data Set Header Record contains information which applies to the following data records, such as data set and time identification, overall data set quality, orbital parameters, and conversion factors for calibration and telemetry data.

The Data Records contain information specific to one scan or time segment of data including time, quality, calibration, navigation, telemetry, and sensor data.

When retrospective data sets are retrieved by users from NOAA archive systems, supplementary records are added by default to the data set to provide archive processing information. These data sets have the following record structure:

Record 1:	Archive Retrieval System (ARS) Header Record
Record 2:	Data Set Header Record
Record 3 - n:	Supplementary Header Records (optional)
Record (n+1) - EOF:	Data Records

The format of the ARS Header Record is the same for all data types. Although the fundamental structure of the NOAA Level 1b data set header records and data records is consistent across data types, the differences are significant and will be addressed separately for each data type.

All the tables in this section share a common legend, which is as follows:

**Legend:**

***Field Name:***

The name or brief description of the field.

***Start Octet:***

Offset location of first octet (8-bit byte) in the defined field from beginning of record. Starting with octet 1. (Note that the terms “octet” and “byte” are used interchangeably and mean the same thing.)

***End Octet:***

Offset location of last octet in the defined field from beginning of record.

***DT:***

Data Type (i - integer, u - unsigned integer, c - character). Character data is stored as ASCII.

***Word Size:***

Number of octets per data word.

***Number of Words:***

Number of words of indicated size and type contained in the defined field.

***Scale Factor:***

Scaling Factor:  $x=y/10^n$ , where  $x$  is the desired floating point value,  $y$  is the stored integer value for the defined field, and  $n$  is the number indicated in the scale factor column for that field.

***Units:***

The field’s unit of measurement (e.g., octets, counts, Kelvin, volts), if applicable.

***Notes:***

References to notes that follow the format specifications.

8.3.1.2 Archive Retrieval System (ARS) Header Record

The ARS Header Record is created by default when data are ordered from the NOAA archive, and

includes information on the data request and how the data was processed from the archive. A detailed description of the contents of this record is presented in Table 8.3.1.2-1.

<b>Table 8.3.1.2-1. Format of ARS Header Record.</b>						
<b>Start Octet</b>	<b>End Octet</b>	<b>DT</b>	<b>Word Size</b>	<b>SF</b>	<b>Number of Words</b>	<b>Order ID</b>
1	6	c	6	0	1	NeS Number

### 8.3.1.3 LAC and HRPT Data Sets

This section describes the characteristics and format of Local Area Coverage (LAC) and High Resolution Picture Transmission (HRPT) data sets for both NOAA KLM and NOAA-N, -N' satellites.

### 8.3.1.3.1 Data Characteristics

The AVHRR data are digitized to 10-bit precision. The digitized data are both transmitted from the satellite in real-time as High Resolution Picture Transmission (HRPT) data, and selectively recorded on board the satellite for subsequent playback as Local Area Coverage (LAC) data. A maximum of ten minutes of LAC data may be recorded per orbit. In all other respects, HRPT and LAC are identical. Table 8.3.1.3.1-1 summarizes fundamental characteristics of the data.

<b>Table 8.3.1.3.1-1. LAC/HRPT Data Characteristics.</b>	
<b>Parameter</b>	<b>Value</b>
Sample word size	10 bits
Number of sampled channels/available channels	5/6
Number of Earth samples per scan	2,048 per channel
Scan rate	360 scans per minute
Scan direction	East to West (northbound)
Instantaneous Field of View (IFOV)	0.07449 degrees (all channels)
Spatial resolution at nadir	1.09 km at 833 km altitude
Cross track distance between sample centers at nadir	1.09 km at 833 km altitude
Along track distance between sample centers at nadir	1.09 km at 833 km altitude
Cross-track scan coverage	± 55.4 degrees from nadir
Swath width	2,399 km at 833 km altitude

### 8.3.1.3.2 Header Records

The Data Set Header Record contains quality, navigation, calibration, and conversion coefficient information which applies to the LAC/HRPT data records which follow. This section describes the header records for NOAA KLM (version 2) and NOAA-N, -N' (version 4/5) satellites. See section 8.3.1 for the version dates. (On November 14, 2006, version 5 was implemented for the LAC/HRPT only. The GAC continues to remain at 4).

#### 8.3.1.3.2.1 Version 2 Format, pre-April 28, 2005

The content of the LAC/HRPT Data Set Header Record for Version 2, is documented in Table 8.3.1.3.2.1-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>Table 8.3.1.3.2.1-1. Format of LAC/HRPT Data Set Header Record (Version 2, pre-April 28, 2005)</b>							
<b>Field Name</b>	<b>Start Octet</b>	<b>End Octet</b>	<b>Data Type</b>	<b>Word Size</b>	<b>Number of Words</b>	<b>Scale Factor</b>	<b>Units</b>

### 8.3.1.3.2.2 NOAA-N Format (Version 5, post-November 14, 2006, all spacecraft)

The format specifications for the AVHRR Level 1b header record for NOAA-N satellite is given in this section. Please note that as part of the updates to the Level 1b formats for NOAA-N there is the inclusion of additional or secondary header records. Applications that will access Level 1b data sets should use the “Count of Header Records in this Data Set” field, located in the first, or primary, header record to calculate the position of the first data record and skip the secondary header records.

Except for the zero-fill padding, the primary header record specification is identical no matter the type of AVHRR data (LAC, GAC, FRAC or HRPT). Table 8.3.3.2.2-1 gives the format for the AVHRR Level 1b primary header record for NOAA-N (Version 4/5), post November 14, 2006 ( all spacecraft). The GAC data was version 4 (v4) and the LAC/HRPT was version 5 (v5).

<b>Table 8.3.1.3.2.2-1. Format of LAC/HRPT Data Set Header Record (Version 5, post-November 14, 2006, all spacecraft).</b>

### 8.3.1.3.3 Data Records

This section describes the format of Local Area Coverage (LAC) and High Resolution Picture Transmission (HRPT) data sets for both NOAA KLM (version 2) and NOAA-N (version 3) satellites.

#### 8.3.1.3.3.1 NOAA KLM Format (Version 2, pre-April 28, 2005)

The Data Records for LAC and HRPT data sets are archived in packed format to reduce storage requirements. Three 10-bit sensor samples are stored in a 32-bit word using the Band Interleaved by Pixel (BIP) method. The format for packed data sets is documented in Table 8.3.1.3.3.1-1. However, this format is inconvenient for data processing.

<b>Table 8.3.1.3.3.1-1. Format of packed LAC/HRPT Data Sets (Version 2, pre-April 28, 2005).</b>								
Field Name	Start Octet	End Octet	Data Type	Word Size	Number of Words	Scale Factor	Units	Notes
<b>SCAN LINE INFORMATION</b>								
Scan Line Number (cumulative, starting with 1)	1	2	u	2	1	0		
Scan Line Year (e.g., 1999)	3	4	u	2	1	0		
Scan Line Day of Year (e.g., 365)	5	6	u	2	1	0		
Satellite Clock Drift Delta	7	.8	i	2	1	0	millisec	
Scan Line UTC Time of Day	9	12	u	4	1	0	millisec	
Scan Line Bit Field bit 15: 0 = northbound data; 1 = southbound data bit 14: 1 = scan time corrected for clock drift bits 13-2: <zero fill> bits 1-0: channel 3 select (0 = 3b; 1 = 3a; 2 = transition)	13	14	u	2	1	0		
<zero fill>	15	24	i	2	5	0		
<b>QUALITY INDICATORS</b>								
Quality Indicator Bit Field If a bit is on (=1) then the statement is true.	25	28	u	4	1	0		

<p>bit 31: do not use scan for product generation  bit 30: time sequence error detected within this scan (see below)  bit 29: data gap precedes this scan  bit 28: insufficient data for calibration (see below)  bit 27: earth location data not available (see below)  bit 26: first good time following a clock update (nominally 0)  bit 25: instrument status changed with this scan  bit 24: sync lock dropped during this frame  bit 23: frame sync word error greater than zero  bit 22: frame sync previously dropped lock  bit 21: flywheeling detected during this frame  bit 20: bit slippage detected during this frame  bits 19-9: &lt;zero fill&gt;  bit 8: TIP parity error detected  bits 7-6: reflected sunlight detected ch 3b (0 = no anomaly; 1 = anomaly; 3 = unsure)  bits 5-4: reflected sunlight detected ch 4 (0 = no anomaly; 1 = anomaly; 3 = unsure)  bits 3-2: reflected sunlight detected ch 5 (0 = no anomaly; 1 = anomaly; 3 = unsure)  bit 1: resync occurred on this frame  bit 0: pseudo noise occurred on this frame</p>									
<p>Scan Line Quality Flags  If a bit is on (=1) then the statement is true.</p> <p><i>Time Problem Code</i>  (All bits off implies the scan time is as expected.)  bits 31-24: &lt;zero fill&gt;  bit 23: time field is bad but can probably be inferred from the previous good time.  bit 22: time field is bad and can't be inferred from the previous good time.  bit 21: this record starts a sequence that is inconsistent with previous times (i.e., there is a time discontinuity). This may or may not be associated with a spacecraft clock update. (See bit 26, Quality Indicator Bit Field)  bit 20: start of a sequence that apparently repeats scan times that have been previously accepted.  bits 19-16: &lt;zero fill&gt;</p> <p><i>Calibration Problem Code</i>  (Note these bits complement the channel indicators; all bits set to 0 indicates normal calibration.)  bit 15: scan line was not calibrated because of bad time.  bit 14: scan line was calibrated using fewer than the preferred number of scan lines because of proximity to start or end of data set or to a data gap.  bit 13: scan line was not calibrated because of bad or insufficient PRT data.  bit 12: scan line was calibrated but with marginal PRT data.</p>	29	32	u	4	1	0			

bit 11: some uncalibrated channels on this scan (see channel indicators) bits 10-8: <zero fill>  <i>Earth Location Problem Code</i> (all bits set to 0 implies the earth location was normal) bit 7: not earth located because of bad time; earth location fields zero filled. bit 6: earth location questionable because of questionable time code. (See time problem flags above). bit 5: earth location questionable -- only marginal agreement with reasonableness check. bit 4: earth location questionable -- fails reasonableness check. bits 3-0: <zero fill>								
Calibration Quality Flags (all bits off implies a good calibration)  <i>Word 1: Channel 3b</i> bits 15 - 8: <zero fill> bit 7: this channel is not calibrated bit 6: this channel is calibrated but questionable bit 5: all bad blackbody counts for scan line bit 4: all bad space view counts for scan line bit 3: <zero fill> bit 2: marginal blackbody view counts for this line bit 1: marginal space view counts for this line bit 0: <zero fill>  <i>Word 2: Channel 4</i> <i>Word 3: Channel 5</i>	33	38	u	2	3	0

<b>NOTES:</b>								
1. 13 Nov 1998: Redefine reserved CLAVR section to include CLAVR Status Bit Field (Fagan, 24 Sep1998); adjust trailing zero-fill.								
Clouds from AVHRR (CLAVR) is a complex set of tests to detect daytime and nighttime cloud cover using multi-channel AVHRR sensor data and a surface type database. The first application of CLAVR at NOAA was to support the first AVHRR Pathfinder Atmosphere (PATMOS) Project. PATMOS was replaced by PATMOS-x which reprocessed the entire AVHRR GAC database to create climate data records quality for climate change studies. More information about PATMOS-x is available at <a href="http://cimss.ssec.wisc.edu/patmosx/">http://cimss.ssec.wisc.edu/patmosx/</a> . Since January 25, 2006, CLAVR-x is part of the operational processing system for NOAA Level 1b GAC, LAC, and HRPT . Bit 0 of the NOAA Level 1b CLAVR Status Bit Field is set to one, and the Clear/Cloudy/Mixed (CCM) Codes are in use. Please note that the NOAA Level 1b format allocates space for only a minimal subset of CLAVR parameters needed to generate products that require cloud masks.								

CLASS allows users to select any combination of one to five channels, and sensor data word sizes of 8 or 16 bits (this is known as the unpacked format). The unpacking process stores each (10-bit) sensor data value in a separate eight or sixteen bit word. When 8-bit words are selected, the sensor

data is reduced from ten to eight bits by removing the least significant two bits. When 16-bit words are selected, the sensor data is stored in the least significant ten bits and the six most significant bits are zero-filled. If a customer does not require all five channels from the AVHRR instrument, the unpacked format can also be reduced to any subset of active channels. At this time, however, the archive extraction programs do not differentiate between channels 3A and 3B. Channel selected data sets are not available in packed format. In all cases, the sensor data is stored in BIP order.

Tables 8.3.1.3.3.1-2 and 8.3.1.3.3.1-3 (containing the 8 and 16-bit unpacked structure, respectively) summarize how the selection of channel and sensor data word size affects the data set structure and record length documented in Table 8.3.1.3.3.1-1. The alignment of data words on eight octet (i.e., 64 bit) boundaries is maintained by adding binary zero-fill after the sensor data section.

8.3.1.3.3.2 NOAA-N Format (Version 5, post-November 14, 2006, all spacecraft)

Table 8.3.1.3.3.2-1 gives the format for the LAC/HRPT Level 1b data record for NOAA-N (version 3, post-April 28, 2005, all spacecraft). Eight and 16-bit extracts of the LAC/HRPT Level 1b data are supported by CLASS for all satellites. Version 4 (v4) was implemented on January 25, 2006, to reflect the start of CLAVR-x processing. Version 5 (v5) was implemented on November 14, 2006, for LAC/HRPT only.

<b>Table 8.3.1.3.3.2-1. Format of LAC/HRPT Data Record for NOAA-N (Version 5, post-November 14, 2006, all spacecraft).</b>

### 8.3.1.4 GAC Data Sets

This section describes the characteristics and formats of Global Area Coverage (GAC) data sets for both NOAA KLM (version 2) and NOAA-N (version 3) satellites. Version 2 format (v2) was used on all NOAA KLM data until April 28, 2005. After this date, the Version 3 format (v3), also known as the NOAA-N format, was implemented for *all* operational POES spacecraft. On January 25, 2006, Version 4 format (v4) was implemented to reflect the start of CLAVR-x processing. There is no plan at this time to reprocess archived data into the new format.

#### 8.3.1.4.1 Data Characteristics

The processor on board the satellite samples the real-time AVHRR data to produce reduced resolution GAC data. Four out of every five samples along the scan line are used to compute one average value, and the data from only every third scan line are processed. As a result, the spatial resolution of GAC data near the subpoint is actually 1.1 km by 4.4 km with a 3.3 km gap between pixels across the scan line, although generally treated as 4 km resolution. All of the GAC data computed during a complete pass are recorded on board the satellite for transmission to Earth on command. The 10-bit precision of the AVHRR data is retained. Table 8.3.1.4.1-1 summarizes fundamental characteristics of the data.

<b>Table 8.3.1.4.1-1. GAC Data Characteristics.</b>	
<b>Parameter</b>	<b>Value</b>
Sample word size	10 bits
Number of sampled channels/available channels	5/6
Number of Earth samples per scan	409 per channel
Scan rate	120 scans per minute
Scan direction	East to West (northbound)
Instantaneous Field of View (IFOV)	0.07449 degrees (all channels)
Spatial resolution at nadir	4.36 km (cross track average) by 1.09 km (along track) at 833 km altitude
Cross track distance between sample centers at nadir	5.45 km at 833 km altitude
Along track distance between sample centers at nadir	3.27 km at 833 km altitude
Cross-track scan coverage	± 55.4 degrees from nadir

Swath width	2,399 km at 833 km altitude
-------------	-----------------------------

#### 8.3.1.4.2 Header Records

The Data Set Header Record contains quality, navigation, calibration, and conversion coefficient information which applies to the GAC data records which follow. This section describes the header records for both NOAA KLM (version 2) and NOAA-N (version 3) satellites. Version 2 formats (v2) were used on all NOAA KLM data until April 28, 2005. After this date, the version 3 format (v3), also known as the NOAA-N format, was implemented for all operational POES spacecraft. Version 4 (v4) was implemented on January 25, 2006, to reflect the start of CLAVR-x processing. Version 5 (v5) was implemented on November 14, 2006, for LAC/HRPT processing only. GAC continues to remain at version 4.

##### 8.3.1.4.2.1 NOAA KLM Header Records (Version 2, pre-April 28, 2005)

With the exception of the zero-fill padding, the format specifications for the GAC Level 1b primary header record for NOAA-KLM (Version 2, pre-April, 2005) is the same as the LAC/HRPT header record (Table 8.3.1.3.2.1-1). Please note that as part of the updates to the Level 1b formats for NOAA-N and -N' is the inclusion of additional, or secondary, header records. They will contain ancillary data set names and any metadata needed for reprocessing. Currently, the content and format of any secondary header records is to be determined. Applications that will access Level 1b data sets should use the "Count of Header Records in this Data Set" field, located in the first, or primary, header record, to calculate the position of the first data record and skip the secondary header records.

##### 8.3.1.4.2.2 NOAA-N Header Records (Version 4, post-January 25, 2006, all spacecraft)

With the exception of the zero-fill padding, the format specifications for the GAC Level 1b primary header record for NOAA-N is the same as the LAC/HRPT header record (Table 8.3.1.3.2.2-1). Please note that as part of the updates to the Level 1b formats for NOAA-N and -N' is the inclusion of additional, or secondary, header records. They will contain ancillary data set names and any metadata needed for reprocessing. Currently, the content and format of any secondary header records is to be determined. Applications that will access Level 1b data sets should use the "Count of Header Records in this Data Set" field, located in the first, or primary, header record, to calculate the position of the first data record and skip the secondary header records.

#### 8.3.1.4.3 Data Records

This section describes the Level 1b GAC data records for both the NOAA KLM and NOAA-N satellites. The Data Records for GAC data sets are archived in packed format to reduce storage requirements. Three 10-bit sensor samples are stored in a 32-bit word using the Band Interleaved by Pixel (BIP) method.

8.3.1.4.3.1 NOAA KLM Format (Version 2, pre-April 28, 2005)

The format for packed GAC data sets for NOAA KLM (version 2, pre-April 28, 2005) is documented in Table 8.3.1.4.3.1-1. However, this format is inconvenient for data processing.

NESDIS archive systems support the selection of any combination of one to five channels, and sensor data word sizes of 8 or 16 bits (this is known as the unpacked format). The unpacking process stores each (10-bit) sensor data value in a separate eight or sixteen bit word. When 8-bit words are selected, the sensor data is reduced from ten to eight bits by removing the least significant two bits. When 16-bit words are selected, the sensor data is stored in the least significant ten bits and the six most significant bits are zero-filled. If a customer does not require all five channels from the AVHRR instrument, the unpacked format can also be reduced to any subset of active channels. At this time, however, the archive extraction programs do not differentiate between channels 3A and 3B. Channel selected data sets are not available in packed format. In all cases, the sensor data is stored in BIP order.

**Table 8.3.1.4.3.1-1. Format of packed GAC Data Record for NOAA KLM (Version 2, pre-April 28, 2005).**

Field Name	Start Octet	End Octet	Data Type	Word Size	Number of Words	Scale Factor	Units	Notes
<b>SCAN LINE INFORMATION</b>								
Scan Line Number (cumulative, starting with 1)	1	2	u	2	1	0		
Scan Line Year (e.g., 1999)	3	4	u	2	1	0		
Scan Line Day of Year (e.g., 365)	5	6	u	2	1	0		
Satellite Clock Drift Delta	7	8	i	2	1	0	millisec	
Scan Line UTC Time of Day	9	12	u	4	1	0	millisec	
Scan Line Bit Field bit 15: 0 = northbound data; 1 = southbound data bit 14: 1 = scan time corrected for clock drift bits 13-2: <zero fill> bits 1-0: channel 3 select (0 = 3b; 1 = 3a; 2 = transition)	13	14	u	2	1	0		
<zero fill>	15	24	i	2	5	0		
<b>QUALITY INDICATORS</b>								
Quality Indicator Bit Field If a bit is on (=1) then the statement is true.  bit 31: do not use scan for product generation bit 30: time sequence error detected within this scan (see below) bit 29: data gap precedes this scan bit 28: insufficient data for calibration (see below)	25	28	u	4	1	0		

<p>bit 27: earth location data not available (see below)  bit 26: first good time following a clock update (nominally 0)  bit 25: instrument status changed with this scan  bit 24: sync lock dropped during this frame  bit 23: frame sync word error greater than zero  bit 22: frame sync previously dropped lock  bit 21: flywheeling detected during this frame  bit 20: bit slippage detected during this frame  bits 19-9: &lt;zero fill&gt;  bit 8: TIP parity error detected  bits 7-6: reflected sunlight detected ch 3b (0 = no anomaly;  1 = anomaly; 3 = unsure)  bits 5-4: reflected sunlight detected ch 4 (0 = no anomaly;  1 = anomaly; 3 = unsure)  bits 3-2: reflected sunlight detected ch 5 (0 = no anomaly;  1 = anomaly; 3 = unsure)  bit 1: resync occurred on this frame  bit 0: pseudo noise occurred on this frame</p>								
<p>Scan Line Quality Flags  If a bit is on (=1) then the statement is true.</p> <p><i>Time Problem Code</i>  (All bits off implies the scan time is as expected.)  bits 31-24: &lt;zero fill&gt;  bit 23: time field is bad but can probably be inferred from the  previous good time.  bit 22: time field is bad and can't be inferred from the  previous good time.  bit 21: this record starts a sequence that is inconsistent with  previous times (i.e., there is a time discontinuity). This may  or may not be associated with a spacecraft clock update. (See  bit 26, Quality Indicator Bit Field)  bit 20: start of a sequence that apparently repeats scan times  that have been previously accepted.  bits 19-16: &lt;zero fill&gt;</p> <p><i>Calibration Problem Code</i>  (Note these bits complement the channel indicators; all bits  set to 0 indicates normal calibration.)  bit 15: scan line was not calibrated because of bad time.  bit 14: scan line was calibrated using fewer than the preferred  number of scan lines because of proximity to start or end of  data set or to a data gap.  bit 13: scan line was not calibrated because of bad or  insufficient PRT data.  bit 12: scan line was calibrated but with marginal PRT data.  bit 11: some uncalibrated channels on this scan (see channel  indicators)  bits 10-8: &lt;zero fill&gt;</p> <p><i>Earth Location Problem Code</i></p>	29	32	u	4	1	0		

(all bits set to 0 implies the earth location was normal) bit 7: not earth located because of bad time; earth location fields zero filled. bit 6: earth location questionable because of questionable time code. (See time problem flags above). bit 5: earth location questionable -- only marginal agreement with reasonableness check. bit 4: earth location questionable -- fails reasonableness check. bits 3-0: <zero fill>								
Calibration Quality Flags (all bits off implies a good calibration)  <i>Word 1: Channel 3b</i> bits 15 - 8: <zero fill> bit 7: this channel is not calibrated bit 6: this channel is calibrated but questionable bit 5: all bad blackbody counts for scan line bit 4: all bad space view counts for scan line bit 3: <zero fill> bit 2: marginal blackbody view counts for this line bit 1: marginal space view counts for this line bit 0: <zero fill>  <i>Word 2: Channel 4</i> <i>Word 3: Channel 5</i>	33	38	u	2	3	0

**NOTES:**

1. 12 Nov 1998: Redefine reserved CLAVR section to include CLAVR Status Bit Field (Fagan, 24 Sep1998); adjust trailing zero-fill.

Clouds from AVHRR (CLAVR) is a complex set of tests to detect daytime and nighttime cloud cover using multi-channel AVHRR sensor data and a surface type database. The first application of CLAVR at NOAA was to support the AVHRR Pathfinder Atmosphere (PATMOS) Project, which reprocessed AVHRR data to correct for calibration drift and produce a consistent record of atmospheric parameters for climate change studies. More information about the NOAA/NASA Pathfinder Program and PATMOS is available at <http://cimss.ssec.wisc.edu/clavr/patmosx.html> . Pathfinder products are available through the Comprehensive Large Array-data Stewardship System (CLASS): <http://www.class.noaa.gov>.

At this time CLAVR is part of the operational processing system for NOAA Level 1b GAC, LAC, and HRPT data sets as of Jan 25, 2006. Therefore, bit 0 of the NOAA Level 1b CLAVR Status Bit Field is set to one, and the Clear/Cloudy/Mixed (CCM) Codes are in use. Please note that the NOAA Level 1b format allocates space for only a minimal subset of CLAVR parameters needed to generate products that require cloud masks. NESDIS intends to implement CLAVR operationally as part of the Modernized AVHRR Processing System (MAPS).

More information about current CLAVR research and development at NOAA is available online at <http://cimss.ssec.wisc.edu/clavr/patmosx.html>.

Tables 8.3.1.4.3.1-2 and 8.3.1.4.3.1-3 (containing the 8 and 16-bit unpacked structure, respectively) summarize how the selection of channel and sensor data word size affects the octet placement of the data set structure documented in Table 8.3.1.4.3.1-1. While the alignment of data words on eight octet (i.e., 64 bit) boundaries is maintained by adding binary zero-fill after the sensor data section, in the interests of minimizing data set size the record lengths are no longer multiples of 512 octets.

8.3.1.4.3.2 NOAA-N Format (Version 4, post-January 25, 2006 all spacecraft)

The format for packed GAC Level 1b data sets for NOAA-N (Version 4, post-January 25, 2006, all spacecraft) is documented in Table 8.3.1.4.3.2-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>Table 8.3.1.4.3.2-1. Format of GAC Data Record for NOAA-N (Version 4, post-January 25, 2006, all spacecraft).</b>								
<b>Field Name</b>	<b>Start Octet</b>	<b>End Octet</b>	<b>Data Type</b>	<b>Word Size</b>	<b>Number of Words</b>	<b>Scale Factor</b>	<b>Units</b>	<b>Notes</b>
<b>SCAN LINE INFORMATION</b>								
Scan Line Number ( <i>cumulative, starting with 1; range: 0 - 65,535</i> )	1	2	u	2	1	0		
Scan Line Year (e.g., 1999)	3	4	u	2	1	0		
Scan Line Day of Year (e.g., 365)	5	6	u	2	1	0		
Satellite Clock Drift Delta	7	8	i	2	1	0	millisec	
Scan Line UTC Time of Day	9	12	u	4	1	0	millisec	
Scan Line Bit Field bit 15: satellite direction (0=northbound; 1=southbound) bit 14: clock drift correction (0=not corrected; 1=scan time corrected for clock drift) bits 13-2: <zero fill> bits 1-0: channel 3 select (0=3B; 1=3A; 2=transition)	13	14	u	2	1	0		
<zero fill>	15	24	i	2	5	0		
<b>QUALITY INDICATORS</b>								

<p>Quality Indicator Bit Field (<i>if a bit is on (=1), the statement is true</i>)</p> <p>bit 31: do not use scan for product generation</p> <p>bit 30: time sequence error detected within this scan (see below)</p> <p>bit 29: data gap precedes this scanbit 28: insufficient data for calibration (see below)</p> <p>bit 27: earth location data not available (see below)</p> <p>bit 26: first good time following a clock update (nominally 0)</p> <p>bit 25: instrument status changed with this scan</p> <p>bit 24: sync lock dropped during this frame (NOAA) or &lt;zero fill&gt; MetOp</p> <p>bit 23: frame sync word has errors (NOAA) or &lt;zero fill&gt; MetOp</p> <p>bit 22: frame sync returned to lock (NOAA) or &lt;zero fill&gt; MetOp</p> <p>bit 21: frame sync word not valid (NOAA) or &lt;zero fill&gt; MetOp</p> <p>bit 20: bit slippage detected during this frame (NOAA) or &lt;zero fill&gt; MetOp</p> <p>bits 19-9: &lt;zero fill&gt;</p> <p>bit 8: TIP parity error detected (NOAA) or &lt;zero fill&gt; MetOp</p> <p>bits 7-6: reflected sunlight detected ch 3B (0=no anomaly; 1=anomaly; 3=unsure)</p> <p>bits 5-4: reflected sunlight detected ch 4 (0=no anomaly; 1=anomaly; 3=unsure)</p> <p>bits 3-2: reflected sunlight detected ch 5 (0=no anomaly; 1=anomaly; 3=unsure)</p> <p>bit 1: resync occurred on this frame (NOAA) or &lt;zero fill&gt; MetOp</p> <p>bit 0: pseudonoise occurred on this frame (NOAA) or &lt;zero fill&gt; MetOp</p>	25	28	u	4	1	0		
Scan Line Quality Flags [<Reserved>] (zero fill)	29	29	u	1	1	0		
<p>Scan Line Quality Flags [Time Problem Code] (<i>If a bit is on (=1), the statement is true. All bits off implies the scan time is as expected.</i>)</p> <p>bit 7: time field is bad but can probably be inferred from the previous good time</p> <p>bit 6: time field is bad and can't be inferred from the previous good time</p> <p>bit 5: this record starts a sequence that is inconsistent with previous times (i.e., there is a time discontinuity). This may be associated with a spacecraft clock update. (See bit 26, Quality Indicator Bit Field.)</p> <p>bit 4: start of a sequence that apparently repeats scan times that have been previously accepted</p> <p>bits 3-0: &lt;zero fill&gt;</p>	30	30	u	1	1	0		

<p>Scan Line Quality Flags [Calibration Problem Code] (<i>If a bit is on (=1), the statement is true. These bits complement the channel indicators; all bits set to 0 indicate normal calibration.</i>)</p> <p>bit 7: scan line not calibrated: all IR channels failed calibration</p> <p>bit 6: scan line marginally calibrated: one or more IR channels marginally calibrated or one or more, but not all, IR channels failed calibration</p> <p>bit 5: scan line was not calibrated: bad or insufficient PRT data</p> <p>bit 4: scan line marginally calibrated: marginal PRT data</p> <p>bit 3: some uncalibrated channels for this scan line (i.e., one or more, but not all, IR channels failed calibration)</p> <p>bit 2: No visible calibration due to either the presence of MIRP pseudonoise in place of AVHRR data (NOAA only) or calibration processing turned off</p> <p>bit 1-0: &lt;zero fill&gt;</p>	31	31	u	1	1	0		
<p>Scan Line Quality Flags [Earth Location Problem Code] (<i>If a bit is on (=1), the statement is true. All bits set to 0 imply the earth location was normal.</i>)</p> <p>bit 7: not earth located because of bad time; earth location fields zero-filled</p> <p>bit 6: earth location questionable: questionable time code (see time problem flags above)</p> <p>bit 5: earth location questionable: marginal agreement with reasonableness check</p> <p>bit 4: earth location questionable: fails reasonableness check</p> <p>bits 3-2: &lt;zero fill&gt;</p> <p>bit 1: not earth located because of satellite in-plane maneuver (MetOp) or &lt;zero fill&gt; (NOAA)</p> <p>bit 0: not earth located because of satellite out-of-plane maneuver (MetOp) or &lt;zero fill&gt; (NOAA)</p>	32	32	u	1	1	0		
<p>Calibration Quality Flags (<i>all bits off implies a good calibration</i>)</p> <p><i>Word 1: Channel 3B</i></p> <p>bits 15-8: &lt;zero fill&gt;</p> <p>bit 7: this channel is not calibrated</p> <p>bit 6: this channel is calibrated but questionable</p> <p>bit 5: all bad blackbody counts for scan line</p> <p>bit 4: all bad space view counts for scan line</p> <p>bit 3: &lt;zero fill&gt;</p> <p>bit 2: marginal blackbody view counts for this line</p> <p>bit 1: marginal space view counts for this line</p> <p>bit 0: &lt;zero fill&gt;</p> <p><i>Words 2-3: Channels 4-5 (in order)</i></p>	33	38	u	2	3	0		
Count of Bit Errors in Frame Sync (NOAA) or <zero fill> (MetOp)	39	40	u	2	1	0

### 8.3.1.5 HIRS Data Sets

This section describes the characteristics and formats of the High Resolution Infrared Radiation Sounder (both HIRS/3 and HIRS/4) data sets for both NOAA KLM (Version 2) and NOAA-N (version 3) satellites. Version 2 formats (v2) were used on all NOAA KLM data until April 28, 2005. After this date, the Version 3 format (v3), also known as the NOAA-N format, will be implemented for all operational POES spacecraft. There is no plan at this time to reprocess archived data into the new format. **After January 25, 2006, the version number contained in the header was updated from 3 to 4 to reflect the inclusion of cloud mask information. All level 1b documentation should reflect that until another change is made.**

#### 8.3.1.5.1 Data Characteristics

This section describes the characteristics of the High Resolution Infrared Radiation Sounder (both HIRS/3 and HIRS/4) instruments.

##### 8.3.1.5.1.1 HIRS/3

HIRS/3 radiometric data is digitized to 13-bit precision. The data is recorded on the satellite and transmitted to Earth on command. Table 8.3.1.5.1.1-1 summarizes fundamental characteristics of the data.

<b>Table 8.3.1.5.1.1-1. HIRS/3 Data Characteristics.</b>	
<b>Parameter</b>	<b>Value</b>
Sample word size	13 bits
Number of sampled channels/available channels	20/20
Number of Earth samples per scan	56 per channel
Scan rate	9.4 scans per minute
Scan direction	West to East (northbound)
Instantaneous Field of View (IFOV)	1.3 to 1.4 degrees
Spatial resolution at nadir	18.9 to 20.3 km at 833 km altitude
Cross track distance between sample centers at nadir	26.2 km at 833 km altitude

Along track distance between sample centers at nadir	42 km at 833 km altitude
Cross-track scan coverage	± 49.5 degrees from nadir
Swath width	2240 km at 833 km altitude

#### 8.3.1.5.1.2 HIRS/4

The HIRS/4 instrument replaced HIRS/3 on NOAA-18 and NOAA-19. Several modifications have been made: 1) the field of view has decreased to 10 km from 19 km for the HIRS/3; 2) another PRT has been added to the blackbody. This is directly in the center and gives a better characterization of the temperature gradient as well as providing a better estimate of the blackbody temperature within the smaller angular field of view; and 3) there is a new temperature sensor near the field stop. Table 3.2.2.1-1 contains a detailed description of the characteristics of the HIRS/4 instrument.

#### 8.3.1.5.2 Header Records

This section describes the header record formats for both HIRS/3 and HIRS/4 instruments for both NOAA KLM (version 2) and NOAA-N (version 3) satellites. Version 2 formats (v2) apply to all NOAA KLM data until April 28, 2005. After this date, the version 3 format (v3), was in effect for all operational POES spacecraft until January 25, 2006. On January 26, 2006, version 4 was implemented to reflect the inclusion of cloud mask information.

##### 8.3.1.5.2.1 HIRS/3 (Flown on NOAA KLM, version 2, pre-April 28, 2005)

The HIRS/3 Data Set Header Record format HIRS/3 (Flown on NOAA KLM, version 2, pre-April 28, 2005) is documented in Table 8.3.1.5.2.1-1.

<b>Table 8.3.1.5.2.1-1. Format of HIRS/3 Data Set Header Record (Flown on NOAA KLM, version 2, pre-April 28, 2005)</b>

Reference Ellipsoid Model ID The ellipsoid is a mathematically tractable approximation of the geoid, which is an equipotential surface at mean sea level. The maximum departure of the ellipsoid from the geoid is approximately $\pm 65$ meters. (WGS-72 = World Geodetic Survey 1972)	761	768	c	8	1	0

8.3.1.5.2.2 HIRS/4 (Flown on NOAA-18 and NOAA-19 and Metop series, version 4, post-January 25, 2006)

This section describes the HIRS/4 Data Set Header Record format (version 4, post-January 25, 2006) and is documented in Table 8.3.1.5.2.2-1.

<b>Table 8.3.1.5.2.2-1. Format of HIRS/4 Data Set Header Record (Flown on NOAA-18, NOAA-19, and Metop series, version 4, post-January 25, 2006)</b>								
Field Name	Start Octet	End Octet	DT	Word Size	Number of Words	S F	Units	Notes

<b>DATA SET QUALITY INDICATORS</b>								
Instrument Status bits 31-16: <zero fill> bit 15: Instrument power (0=off; 1=on) bit 14: Electronics power (0=off; 1=on) bit 13: Filter motor power (0=off; 1=on) bit 12: Scan motor power (0=off; 1=on) bit 11: Cooler heater (0=off; 1=on) bit 10: Filter housing heater(0=off; 1=on) bit 9: Cooler door release (0=disabled; 1=enabled) bit 8: Cooler window heater (0=on; 1=off) bit 7: Go to NADIR position (0=no; 1=yes/initiated) bit 6: Calibration sequence (0=disabled; 1=enabled) bit 5: Cooler door closed (0=yes; 1=no) bit 4: Cooler door fully open (0=yes; 1=no) bit 3: Filter motor power level (0=normal; 1=high) bit 2: Patch temperature controller (0=off; 1=on) bits 1-0: <zero fill>	117	120	u	4	1	0		
<zero fill>	121	122	i	2	1	0		

Record Number of Status Change (if 0, none occurred)	123	124	u	2	1	0		
Second Instrument Status (if previous word is 0, no change)	125	128	u	4	1	0		
Count of Data Records in this Data Set	129	130	u	2	1	0		
Count of Calibrated, Earth Located Scan Lines in this Data Set	131	132	u	2	1	0		
Count of Missing Scan Lines	133	134	u	2	1	0		
Count of Data Gaps in this Data Set	135	136	u	2	1	0		
Count of Data Frames Without Frame Sync Word Errors ( <i>NOAA</i> ) or <Zero fill> ( <i>MetOp</i> )	137	138	u	2	1	0		
Count of PACS Detected TIP Parity Errors( <i>NOAA</i> ) or <Zero fill> ( <i>MetOp</i> )	139	140	u	2	1	0		
Sum of All Auxiliary Sync Errors Detected in the Input Data ( <i>NOAA</i> ) or <Zero fill> ( <i>MetOp</i> )	141	142	u	2	1	0		
Time Sequence Error (0 = none; otherwise the record number of the first occurrence)	143	144	u	2	1	0		
Time Sequence Error Code <i>These are bit flags taken from Scan Line Quality Flags Time Problem Code on data record reported in Time Sequence Error field above. If a bit is on (=1) then the statement is true.</i>  bits 15 - 8: <zero fill> bit 7: time field is bad but can probably be inferred from the previous good time. bit 6: time field is bad and can't be inferred from the previous good time. bit 5: this record starts a sequence that is inconsistent with previous times (i.e., there is a time discontinuity). This may or may not be associated with a spacecraft clock update. bit 4: start of a sequence that apparently repeats scan times that have been previously accepted. bits 3 - 0: <zero fill>	145	146	u	2	1	0		

SOCC Clock Update Indicator (0 = none during this orbit; otherwise the record number of the first occurrence)	147	148	u	2	1	0		
Earth Location Error Indicator (0 = none during this orbit; otherwise the record number of the first occurrence)	149	150	u	2	1	0		
Earth Location Error Code <i>These are bit flags taken from Scan Line Quality Flags Earth Location Problem Code on data record reported in Earth Location Error Indicator field above. If a bit is on (=1) then the statement is true.</i>  bits 15 - 8: <zero fill> bit 7: not earth located because of bad time; earth location fields zero filled. bit 6: earth location questionable because of questionable time code. (See time problem flags above.) bit 5: earth location questionable -- only marginal agreement with reasonableness check. bit 4: earth location questionable -- fails reasonableness check. bits 3-2: <zero fill> bit 1: not earth located because of in-plane maneuver (MetOp) or <zero fill> (NOAA) bit 0: not earth located because of out-of-plane maneuver (MetOp) or <zero fill> (NOAA)	151	152	u	2	1	0		
PACS Status Bit Field  bits 15-3: <zero fill> bit 2: pseudo noise (0 = normal data; 1 = P/N data) bit 1: tape direction (0 = time decrementing) bit 0: data mode (0 = test data; 1 = flight data)	153	154	u	2	1	0		
PACS Data Source  0 = unused; 1 = Fairbanks, AK; 2 = Wallops Is, VA; 3 = SOCC; 4 = Svalbard, Norway; 5 = Monterey, CA	155	156	u	2	1	0		

<zero fill>	157	160	i	4	1	0

<b>NAVIGATION</b>								
Reference Ellipsoid Model ID The ellipsoid is a mathematically tractable approximation of the geoid, which is an equipotential surface at mean sea level. The maximum departure of the ellipsoid from the geoid is approximately ± 65 meters. (WGS-72 = World Geodetic Survey 1972) JGM3 =Joint Gravity Model 3	761	768	c	8	1	0

Satellite Clock Drift Delta	7	8	i	2	1	0	milli-seconds	
Scan Line UTC Time of Day	9	12	u	4	1	0	milli-seconds	
Scan Line Bit Field bit 15: 0 = northbound data; 1 = southbound data bit 14: 1 = scan time corrected for clock drift bits 13-0: <zero fill>	13	14	u	2	1	0		
Major Frame Count (cumulative, starting with 1)	15	16	u	2	1	0		
Scan Position Number in 32 Second Cycle	17	18	u	2	1	0		
Scan Type Code 0 = earth view; 1 = space view; 2 = cold BB view; 3 = main BB view	19	20	u	2	1	0		
<zero fill>	21	28	i	4	2	0		
<b>QUALITY INDICATORS</b>								
Quality Indicator Bit Field If a bit is on (=1) then the statement is true.  bit 31: do not use scan for product generation bit 30: time sequence error detected within this scan (see below) bit 29: data gap precedes this scan bit 28: insufficient data for calibration anomaly detected (see below) bit 27: earth location data not available	29	32	u	4	1	0		

(see below) bit 26: first good time following a clock update (nominally 0) bit 25: instrument status changed with this scan bits 24 - 0: <zero fill>								
<p>Scan Line Quality Flags If a bit is on (=1) then the statement is true.</p> <p><i>Time Problem Code</i> (All bits off implies the scan time is as expected.) bits 31-24: &lt;zero fill&gt; bit 23: time field is bad but can probably be inferred from the previous good time. bit 22: time field is bad and can't be inferred from the previous good time. bit 21: this record starts a sequence that is inconsistent with previous times (i.e., there is a time discontinuity). This may or may not be associated with a spacecraft clock update. (See bit 26, Quality Indicator Bit Field) bit 20: start of a sequence that apparently repeats scan times that have been previously accepted. bits 19 - 16: &lt;zero fill&gt;</p> <p><i>Calibration Anomaly Problem Code</i> (Note these bits complement the channel indicators; all bits set to 0 indicates normal calibration.) bit 15: scan line was not calibrated because of bad time. bit 14: scan line was calibrated using fewer than the preferred number of scan lines because of proximity to start or end of data set or to a data gap. bit 13: scan line was not calibrated because of bad or insufficient PRT data. bit 12: scan line was calibrated but with marginal PRT data. bit 11: some uncalibrated channels on this scan (see channel indicators). bit 10: uncalibrated due to instrument mode. bits 9: moonlight detected in space views bit- 8: &lt;zero fill&gt;</p>	33	36	u	4	1	0		

<p><i>Earth Location Problem Code</i>  (all bits set to 0 implies the earth location was normal)  bit 7: not earth located because of bad time; earth location fields zero filled.  bit 6: earth location questionable because of questionable time code (see time problem flags above).  bit 5: earth location questionable -- only marginal agreement with reasonableness check.  bit 4: earth location questionable -- fails reasonableness check.  bits 3-0: &lt;zero fill&gt;</p>								
<p>Calibration Quality Flags  (all bits off implies a good calibration)</p> <p><i>Word 1: Channel 1</i>  bit 15-6: &lt;zero fill&gt;  bit 5: all bad blackbody counts for scan line  bit 4: all bad space view counts for scan line  bit 3: all bad PRTs for this line  bit 2: marginal blackbody view counts for this line  bit 1: marginal space view counts for this line  bit 0: marginal PRT temperatures on this line</p> <p><i>Words 2-20</i>  Channels 17, 2, 3, 13, 4, 18, 11, 19, 7, 8, 20, 10, 14, 6, 5, 15, 12, 16, 9 (in order)</p>	37	76	u	2	20	0		
<p>Minor Frame Quality Indicator Bit Fields  For bits 7 through 1, if bit is on (=1) then statement is true.</p> <p><i>Word 1: Minor Frame 0</i>  bit 7: this frame suspect due to a time error  bit 6: this frame contains data gap data fill  bit 5: this frame contains TIP dwell data fill  bit 4: data suspect due to PACS QC error  bit 3: mirror locked during this frame  bit 2: mirror position error during this</p>	77	140	u	1	64	0		

frame bit 1: mirror was moving during this frame bit 0: minor word odd parity bit  <i>Words 2 - 64: Minor Frames 1 - 63 (in order)</i>								
<zero fill>	141	156	i	4	4	0		
<b>CALIBRATION COEFFICIENTS</b>								
Note: The following coefficients are <zero fill> in commanded position modes (nadir, space, internal cold target, internal warm target). Refer to Data Element 63, First and Second Status Words for the current mode.

### 8.3.1.5.3.2 NOAA-N Format (Version 4, post-January 25, 2006)

The HIRS/4 Level 1b Data Format (Version 4, post-January 25, 2006, NOAA-18, NOAA-19 and Metop Series) is described in Table 8.3.1.5.3.2-1.

Table 8.3.1.5.3.2-1. Format of HIRS/4 Data Format (Version 4, post-January 25, 2006, NOAA-18, NOAA-19 and Metop Series)								
Field Name	Start Octet	End Octet	Data Type	Word Size	Number of Words	Scale Factor	Units	Notes
<b>SCAN LINE INFORMATION</b>								
Scan Line Number (cumulative, starting with 1)	1	2	u	2	1	0		
Scan Line Year (e.g., 1999)	3	4	u	2	1	0		
Scan Line Day of Year (e.g., 365)	5	6	u	2	1	0		
Satellite Clock Drift Delta	7	8	i	2	1	0	millisec	
Scan Line UTC Time of Day	9	12	u	4	1	0	millisec	
Scan Line Bit Field bit 15: satellite direction (0=northbound; 1=southbound) bit 14: clock drift correction (0=not corrected; 1=scan time corrected for clock drift) bits 13-0: <zero fill>	13	14	u	2	1	0		
Major Frame Count (cumulative, starting with 1)	15	16	u	2	1	0		
Scan Position Number in 32 Second Cycle	17	18	u	2	1	0		
Scan Type Code 0=earth view 1=space view 2=cold blackbody (BB) view 3=main (warm) BB view	19	20	u	2	1	0		
<zero fill>	21	28	i	4	2	0		
<b>QUALITY INDICATORS</b>								
Quality Indicator Bit Field (if a bit is on (=1), the statement is true) bit 31: do not use scan for product generation bit 30: time sequence error detected within this scan (see below) bit 29: data gap precedes this scan bit 28: calibration anomaly detected (see below) bit 27: earth location data not available (see below) bit 26: first good time following a clock update (nominally 0) bit 25: instrument status changed with this scan bits 24 - 0: <zero fill>	29	32	u	4	1	0		

Scan Line Quality Flags [Additional Calibration Problem Code] (If a bit is on (=1), the statement is true. See "Scan Line Quality Flags [Calibration Problem Code]", below.) bits 7-0: <zero fill>	33	33	u	1	1	0		
Scan Line Quality Flags [Time Problem Code] (If a bit is on (=1), the statement is true. All bits off implies the scan time is as expected.) bit 7: time field is bad but can probably be inferred from the previous good time bit 6: time field is bad and can't be inferred from the previous good time bit 5: this record starts a sequence that is inconsistent with previous times (i.e., there is a time discontinuity). This may be associated with a spacecraft clock update. (See bit 26, Quality Indicator Bit Field.) bit 4: start of a sequence that apparently repeats scan times that have been previously accepted bits 3-0: <zero fill>	34	34	u	1	1	0		
Scan Line Quality Flags [Calibration Problem Code] (If a bit is on (=1), the statement is true. These bits, along with those in "Scan Line Quality Flags [Additional Calibration Problem Code]", complement the channel indicators; all bits set to 0 indicates normal calibration.) bit 7: scan was not calibrated bit 6: anomalous space or BB view data, calibration slope value came from the HCF, or some QC tests could not be applied in some of the IR channels bit 5: PRT quality test failed bit 4: PRT data marginal, some readings were rejected bit 3: scan contains some uncalibrated channels bit 2: scan indicates that the normal HIRS calibration sequence is disabled bit 1: space view scan is lunar contaminated bit 0: <zero fill>	35	35	u	1	1	0		
Scan Line Quality Flags [Earth Location Problem Code] (If a bit is on (=1), the statement is true. All bits set to 0 implies the earth location was normal.) bit 7: not earth located because of bad time; earth location fields zero-filled bit 6: earth location questionable: questionable time code (see time problem flags above) bit 5: earth location questionable: marginal agreement with reasonableness check bit 4: earth location questionable: fails reasonableness check bits 3-0: <zero fill>	36	36	u	1	1	0		4

Calibration Quality Flags NOTE: (1) All bits off implies a good calibration. (2) These flags on the earth view scans for each channel will be inherited from the flags on the space view and blackbody view scans. Word 1: Channel 1 bit 15-6: <zero fill> bit 5: calibration failed bit 4: anomalous space or BB view data bit 3: calibration slope value came from the HCF bit 2: BB views failed NEDC test bit 1: space views failed NEDC test bit 0: some QC tests could not be applied Words 2-20: Channels 17, 2, 3, 13, 4, 18, 11, 19, 7, 8, 20, 10, 14, 6, 5, 15, 12, 16, 9 (in order)	37	76	u	2	20	0		3
Minor Frame Quality Indicator Bit Fields (for bits 7 through 1, if bit is on (=1) then statement is true) Word 1: Minor Frame 0 bit 7: this frame suspect due to a time error bit 6: this frame contains data gap data fill bit 5: this frame contains TIP dwell data fill bit 4: data suspect due to PACS QC error bit 3: mirror locked during this frame bit 2: mirror position error during this frame bit 1: mirror was moving during this frame bit 0: minor word odd parity bit Words 2 - 64: Minor Frames 1 - 63 (in order)	77	140	u	1	64	0		
<zero fill>	141	156	i	4	4	0		
<b>CALIBRATION COEFFICIENTS</b>								
<i>Note: The following coefficients are &lt;zero fill&gt; in commanded position modes (nadir, space, internal cold target, internal warm target). Refer to Data Element 63, First and Second Status Words for the current mode.</i>

<b>NAVIGATION</b>								
Computed Yaw Steering ( <i>MetOp: contend definded below</i> ) or <Zero Fill> (NOAA)	637	642	i	2	3	0	degrees	
Total Applied Attitude Correction Word 1: Roll Word 2: Pitch Word 3: Yaw	643	648	i	2	3	3	degrees	

Navigation Status Bit Field ( <i>content, defined below, depends on origin of data, either NOAA or Metop</i> ) <i>For NOAA Data:</i> bits 31-18: <zero fill> bit 17: earth location at the satellite subpoint is accurate and reasonable, i.e., is within tolerance defined by "Nadir Earth Location Tolerance" in header (0=out of tolerance; 1=in tolerance) bit 16: Euler error angles from the CPU telemetry used by AELDS to correct the earth locations (0=FALSE; 1=TRUE) bits 15-12: earth location indicator (0=earth location available; 1=first scan whose time is more than 24 hours older than the time [epoch] of the user ephemeris file; 2=no earth location available) bits 11-8: spacecraft attitude control (0=operating in YGC or NOMINAL mode and attitude is good; 1=operating in another mode but attitude is good; 2=operating in YGC or NOMINAL mode but tests are being conducted which may cause attitude to exceed nominal tolerance; 3=operating in another mode while tests are being conducted which may cause attitude to exceed nominal tolerance) bits 7-4: attitude SMODE (0=nominal mode; 1=rate nulling mode; 2=YGC mode; 3=search mode; 4=coast mode) bits 3-0: attitude PWTIP\$AC (0=nominal mode/no test; 1=yaw axis test in progress; 2=roll axis test in progress; 3=pitch axis test in progress) <i>For Metop Data:</i> bits 31-21: <zero fill> bit 20-19: yaw steering parameters usage indicator (0=no yaw steering correction; 1=measured angles from the Metop SVM telemetry; 2=computed angles from AELDS; 3=measured angles + computed angles) bit 18: Metop maneuver indicator (0=scan does not occur during a Metop in-plane or out-of-plane maneuver; 1=scan, or some part of it, occurs during a maneuver) bit 17: <same as defined for NOAA, above> bit 16: <zero fill> bits 15-12: <same as defined for NOAA, above> bits 11-8: <zero fill> bits 7-4: OPM PF sub-mode (0=fine pointing mode (FPM); 1=yaw steering mode (YSM)) bits 3-0: SVM PF mode (0=LHM; 1=RRM; 2=CAM; 3=FAM1; 4=FAM2; 5=FAM3; 6=OPM; 7=OCM1; 8=OCM2; 9=OCMT; 10=OCM0)	649	652	u	4	1	0		
Time Associated with Euler Angles	653	656	i	4	1	0	seconds	
Euler Angles ( <i>NOAA, from TIP CPU telemetry near end of scan; MetOp [in FPM] from SVM telemetry just before start of scan</i> ) or Yaw Steering Parameters ( <i>MetOp [in YSM], from SVM telemetry or AELDS near nadir of scan</i> ) Word 1: Roll Word 2: Pitch Word 3: Yaw	657	662	i	2	3	3	degrees	
Spacecraft Altitude above Reference Ellipsoid	663	664	u	2	1	1	km	

Angular Relationships ( <i>relative azimuth range +/- 180.00 degrees</i> ) Word 1: Solar zenith angle, FOV 1 Word 2: Satellite zenith angle, FOV 1 Word 3: Relative azimuth angle, FOV 1 Word 4: Solar zenith angle, FOV 2 ... (set of 3 angles every FOV) ... Word 168: Relative azimuth angle, FOV56	665	1000	i	2	168	2	degrees	
Earth Location ( <i>north latitude and east longitude are positive</i> ) Word 1: Latitude, FOV 1 Word 2: Longitude, FOV 1 Word 3: Latitude, FOV 2 ... (lat/lon word pair every FOV) ... Word 112: Longitude, FOV 56	1001	1448	i	4	112	4	degrees	
Lunar Angle ( <i>angle between moon and space view; only applicable for the space view scan, otherwise, undefined; range 0 to 180.00 degrees</i> )	1449	1450	u	2	1	2	degrees

<b>FILLER</b>								
<zero fill>	4565	4608	i	4	11	0		
<p>NOTES:</p> <p>1) The interpretation of the HIRS data is dependent on the element in which it resides. Each 13-bit HIRS word in the 56 FOVs (elements 0-55) is stored in the least significant 13 bits of a 2-byte word. Therefore, bits 15-13 are zero fill, bit 12 is the HIRS inverted sign bit, and bits 11-0 is the radiant signal amplitude. However, if the HIRS word is negative, bits 11-0 are in a "two's complement-like" form (see description in "Radiometric Data for Element 0"). Each 13-bit HIRS word in the remaining 8 elements (56-63) that represents a value (i.e., not packed bit flags and fields) is "unpacked" into a 2-byte word. Therefore, bit 15 is the sign bit (not inverted) and bits 14-0 is the magnitude of the value (in two's complement form if the value is negative).</p> <p>2) To unpack a channel's 2-byte, radiometric reading, subtract 4,096 from it--i.e., "u = p - 4096", where 'p' is the channel's reading as stored in the Level 1b (described below), and 'u' is the unpacked reading.</p> <p>3) Anomalous is defined as the absolute value (mean - median) &gt; NEDC where mean and median are after 3 sigma filtering. The channel calibration quality flags for earth views for each channel will be inherited from the flags in the space and blackbody view scan lines.</p> <p>4) This is triggered if bit 4, 3, or 0 in channel calibration quality flag is set for any IR channel.</p>								

### 8.3.1.6 AMSU-A Data Sets

This section describes the characteristics and formats of Advanced Microwave Sounding Unit-A (AMSU-A) data sets for both NOAA KLM (version 2) and NOAA-N (version 3) satellites. Version 2 formats (v2) were used on all NOAA KLM data until April 28, 2005, after which version 3 format (v3), also known as the NOAA-N format, was in effect for all operational POES spacecraft until January 25, 2006. After January 25, 2006, the version 4 was implemented to reflect the inclusion of cloud mask information.

#### 8.3.1.6.1 Data Characteristics

Table 8.3.1.6.1-1 summarizes fundamental characteristics of the data.

<b>Table 8.3.1.6.1-1. AMSU-A Data Characteristics.</b>	
<b>Parameter</b>	<b>Value</b>
Sample word size	16 bits
Number of sampled channels/available channels	15/15
Number of Earth samples per scan	30 per channel
Scan rate	7.5 scans per minute
Scan direction	West to East (northbound)
Instantaneous Field of View (IFOV)	3.3 degrees (all channels)

Spatial resolution at nadir	48 km at 833 km altitude
Cross track distance between sample centers at nadir	48 km at 833 km altitude
Along track distance between sample centers at nadir	52.7 km at 833 km altitude
Cross-track scan coverage	± 50 degrees from nadir
Swath width	2069.6 km at 833 km altitude

### 8.3.1.6.2 Header Records

The Data Set Header Record contains quality, navigation, calibration and conversion coefficient information which applies to the AMSU-A data records which follow. This section describes the header records for both NOAA KLM (Version 2) and NOAA-N (Version 3) satellites. Version 2 was in effect on all NOAA KLM data until April 28, 2005, then version 3 format (v3), also known as the NOAA-N format, was in effect for all operational POES spacecraft until January 25, 2006. After January 25, 2006 the format was changed to version 4 to reflect the inclusion of cloud mask information.

#### 8.3.1.6.2.1 NOAA KLM Format (Version 2, pre-April 28, 2005)

The AMSU-A Data Set Header Record format (version 2, pre-April 28, 2005) is documented in Table 8.3.1.6.2.1-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

8.3.1.6.2.2 NOAA-N Format (Version 4, post-January 25, 2006, All Spacecraft)

The AMSU-A Data Set Header Record format (Version 4, post-January 25, 2006, All Spacecraft) is documented in Table 8.3.1.6.2.2-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>Table 8.3.1.6.2.2-1. Format of AMSU-A Data Set Header Record (Version 4, post-January 25, 2006, All Spacecraft).</b>

<b>LUNAR CONTAMINATION CORRECTION</b>								
Count of Scans containing Lunar-Contaminated Space Views (Also, see bits 6 and 7 of "Calibration Quality Flags" field in data record.) -1=the detection algorithm for lunar-contamination is turned off 0=the detection algorithm is turned on: no scans containing lunar-contaminated space views were found 0=the detection algorithm is turned on: the value in this field represents the number of scans found that contain lunar-contaminated space views	2557	2558	i	2	1	0		
Distance between the Earth and Moon (average of distance computed on first and last scans of orbit)	2359	2360	u	2	1	2	Earth radii ( $R_E$ )	
Angle between the Moon and Sun (as seen from the earth; average of angle computed on first and last scans of orbit; range: 0 - 180)	2361	2362	u	2	1	2	degrees	
<zero fill>	2363	2364	i	2	1	0		
For NOAA originated AMSU-A data, these fields are spare (<zero fill>)	2365	2400	i	2	18	0		
<b>Filler</b>								
<zero fill>	2401	2560	i	2	80	0		

**NOTES:**

- 1) An AMSU-A instrument on NOAA-N,-N' may produce a brief period of erroneous data during its transition between one mode and another. This transition period is defined as "NO" mode. Some "NO" mode events will occur during on-orbit validation (OV). After OV it is expected that the instrument will be kept in the normal scan mode, and thus will not get into "NO" mode.
- 2) For AMSU-A2, "RF Mux" is only applicable for NOAA KLM, while "RF Diplexer" is only applicable for NOAA-N,-N'.
- 3) The local oscillators (LOs) for the NOAA KLM AMSU-A instruments are Gunn Diode Oscillators (GDOs). The LOs for channels 1-8 of the NOAA-N,-N' AMSU-A instruments are Dielectric Resonant Oscillators (DROs). A GDO is still used for channel 15.
- 4) There are no conversion coefficients available for the last item, "Reference voltage", so none are specified in the header.

8.3.1.6.3 Data Record Format

8.3.1.6.3.1 NOAA-KLM (Version-2, pre-april 28, 2005)

8.3.1.6.3.2 Format of AMSU-A Data Record Format (Version 4, post-January 25, 2006, All Spacecraft).

**Table 8.3.1.6.3.2-1. Format of AMSU-A Data Record Format (Version 4, post-January 25, 2006, All Spacecraft).**

Field Name	Start Octet	End Octet	Data Type	Word Size	Number of Words	Scale Factor	Units	Notes
<b>SCAN LINE INFORMATION</b>								
Scan Line Number ( <i>cumulative, starting with 1</i> )	1	2	u	2	1	0		
Scan Line Year ( <i>four digits, e.g., 2000</i> )	3	4	u	2	1	0		
Scan Line Day of Year ( <i>e.g., 365</i> )	5	6	u	2	1	0		
Satellite Clock Drift Delta	7	8	i	2	1	0	milli-sec	
Scan Line UTC Time of Day	9	12	u	4	1	0	milli-sec	
Scan Line Bit Field bit 15: satellite direction (0=northbound; 1=southbound) bit 14: clock drift correction (0=not corrected; 1=scan time corrected for clock drift) bits 13-0: <zero fill>	13	14	u	2	1	0		
Major Frame Count ( <i>cumulative, starting with 1</i> ) (NOAA) or <Zero Fill> (Metop)	15	16	u	2	1	0		
<Zero Fill>	17	24	i	4	2	0		
<b>QUALITY INDICATORS</b>								
Quality Indicator Bit Field ( <i>if a bit is on (=1), the statement is true</i> ) bit 31: do not use scan for product generation bit 30: time sequence error detected within this scan (see "Scan Line Quality Flags [Time Problem Code]") bit 29: data gap precedes this scan bit 28: insufficient data for calibration (see "Scan Line Quality Flags [Calibration Problem Code]" and "Scan Line Quality Flags [Additional Calibration Problem Code]") bit 27: earth location data not available (see "Scan Line Quality Flags [Earth Location Problem Code]") bit 26: first good time following a clock update (nominally 0) bit 25: instrument status changed with this scan bits 24-4: <zero fill> bit 3: AMSU sync error detected (NOAA) or <zero fill> (Metop) bit 2: AMSU minor frame error detected (NOAA) or <zero fill> (Metop) bit 1: AMSU major frame error detected (NOAA) or <zero fill> (Metop) bit 0: AMSU parity error detected (NOAA) or <zero fill> (Metop)	25	28	u	4	1	0		
Scan Line Quality Flags [Additional Calibration Problem Code] ( <i>If a bit is on (=1), the statement is true. See "Scan Line Quality Flags [Calibration Problem Code]", below.</i> ) bits 7-0: <zero fill>	29	29	u	1	1	0		

<p>Scan Line Quality Flags [Time Problem Code] <i>(If a bit is on (=1), the statement is true. All bits off implies the scan time is as expected.)</i></p> <p>bit 7: time field is bad but can probably be inferred from the previous good time  bit 6: time field is bad and can't be inferred from the previous good time  bit 5: this record starts a sequence that is inconsistent with previous times (i.e., there is a time discontinuity). This may be associated with a spacecraft clock update. (See bit 26, Quality Indicator Bit Field.)  bit 4: start of a sequence that apparently repeats scan times that have been previously accepted  bits 3-0: &lt;zero fill&gt;</p>	30	30	u	1	1	0		
<p>Scan Line Quality Flags [Calibration Problem Code] <i>(If a bit is on (=1), the statement is true. These bits, along with those in "Scan Line Quality Flags [Additional Calibration Problem Code]", complement the channel indicators; all bits set to 0 indicates normal calibration.)</i></p> <p>bit 7: scan line was not calibrated because of bad time  bit 6: scan line was calibrated using fewer than the preferred number of scan lines because of proximity to start or end of data set or to a data gap  bit 5: scan line was not calibrated because of bad or insufficient PRT data  bit 4: scan line was calibrated but with marginal PRT data  bit 3: some uncalibrated channels on this scan (see channel indicators)  bit 2: uncalibrated due to instrument mode  bit 1: questionable calibration because of antenna position error of space view  bit 0: questionable calibration because of antenna position error of blackbody view</p>	31	31	u	1	1	0		
<p>Scan Line Quality Flags [Earth Location Problem Code] <i>(If a bit is on (=1), the statement is true. All bits set to 0 implies the earth location was normal.)</i></p> <p>bit 7: not earth located because of bad time; earth location fields zero-filled  bit 6: earth location questionable: questionable time code (see time problem flags above)  bit 5: earth location questionable: marginal agreement with reasonableness check  bit 4: earth location questionable: fails reasonableness check  bit 3: earth location questionable because of antenna position check  bit 2: &lt;zero fill&gt;  bit 1: earth location questionable: satellite in-plane maneuver (Metop) or &lt;zero fill&gt; (NOAA)  bit 0: earth location questionable: satellite out-of-plane maneuver (Metop) or &lt;zero fill&gt; (NOAA)</p>	32	32	u	1	1	0		

Calibration Quality Flags ( <i>all bits off implies a good calibration</i> ) <i>Word 1: Channel 1</i> bits 15-9: <zero fill> bit 8: this scan line is either the last one before or the first one after a sudden, anomalous jump (or drop) in calibration counts bit 7: lunar contamination was detected in the space view counts of this channel bit 6: the space view counts of this channel were corrected for lunar contamination when used in the calibration (only applicable if the previous flag [bit 7] is 1; otherwise, zero) bit 5: all bad blackbody view counts for scan line bit 4: all bad space view counts for scan line bit 3: all bad PRTs for this line bit 2: marginal blackbody view counts for this line bit 1: marginal space view counts for this line bit 0: marginal PRT temps on this line  <i>Words 2-15: Channels 2-15 (in order)</i>  <i>Word 16: &lt;zero fill&gt;</i>	33	64	u	2	16	0		
<Zero Fill>	65	80	i	4	4	0		
<b>CALIBRATION COEFFICIENTS</b>								
<i>Note: The following coefficients are only available in Full Scan mode, otherwise the coefficient fields are &lt;Zero Fill&gt;. Refer to Digital A Telemetry, Digital Housekeeping Word 1 for the current mode.</i>

### 8.3.1.7 AMSU-B Data Sets

This section describes the characteristics and format of Advanced Microwave Sounding Unit-B (AMSU-B) data sets for each version. Note: AMSU-B was replaced with the Microwave Humidity Sounder starting with NOAA-N. The format changes remain in step with the other instruments' formats for the NOAA KLM satellites.

#### 8.3.1.7.1 Data Characteristics

Table 8.3.1.7.1-1 summarizes fundamental characteristics of the data.

<b>Parameter</b>	<b>Value</b>
Sample word size	16 bits
Number of sampled channels/available channels	5/5
Number of Earth samples per scan	90 per channel
Scan rate	22.5 scans per minute
Scan direction	West to East (northbound)
Instantaneous Field of View (IFOV)	1.1 degrees (all channels)
Spatial resolution at nadir	16 km at 833 km altitude
Cross track distance between sample centers at nadir	16 km at 833 km altitude
Along track distance between sample centers at nadir	17.6 km at 833 km altitude
Cross-track scan coverage	± 49.5 degrees from nadir
Swath width	2126.2 km at 833 km altitude

### 8.3.1.7.2 Header Records

The Data Set Header Record contains quality, navigation, calibration and conversion coefficient information which applies to the AMSU-B data records which follow. This section describes the header records for both NOAA KLM (version 2) and NOAA-N (version 3) satellites. Version 2 formats (v2) were used on all NOAA KLM data until April 28, 2005. After this date, the Version 3 format (v3) was in effect for all operational POES spacecraft until January 25, 2006. Since January 26, 2006 Version 4 was used to reflect the inclusion of cloud mask information

#### 8.3.1.7.2.1 NOAA KLM (Version 2, pre-April 28, 2005)

The AMSU-B Data Set Header Record format for NOAA KLM (Version 2, pre-April 28, 2005) is documented in Table 8.3.1.7.2.1-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>DATA SET QUALITY INDICATORS</b>						
Instrument Status bits 31 - 29: <not defined> bit 28: processor check flag (0 = passed; 1 = failed) bit 27: scan control status (0 = running; 1 = aborted) bit 26: pixel data invalid flag (0 = valid; 1 = invalid) bit 25: scan synchronization (0 = error < 0.1 deg; 1 = error >= 0.1 deg) bit 24: mode transition flag (0 = transition complete; 1 = transition in progress) bit 23: module ID (msb) (0 = EM; 4 = PFM; 8 = FM2; 12 = FM3) bits 22 - 17: module ID bit 16: module ID (lsb) bit 15: RAM check flag (0 = passed; 1 = failed) bit 14: ROM check flag (0 = passed; 1 = failed) bit 13: memory checks status (0 = disabled; 1 = enabled) bit 12: space view select (lsb) bit 11: space view select (msb) bit 10: channel 18/19/20 on/off (relay 5 status) (0 = off; 1 = on) bit 9: channel 17 on/off (relay 4 status) (0 = off; 1 = on) bit 8: channel 16 on/off (relay 3 status) (0 = off; 1 = on) bit 7: stepped mode (0 = no; 1 = yes) bit 6: investigation mode (0 = no; 1 = yes) bit 5: parked in space view mode (0 = no; 1 = yes) bit 4: parked in nadir view mode (0 = no; 1 = yes) bit 3: parked in target view mode (0 = no; 1 = yes) bit 2: scan normal mode (0 = no; 1 = yes) bit 1: survival heater on/off (relay 2 status) (0 = off; 1 = on) bit 0: power on/off (relay 1 status) (0 = off; 1 = on)	121	124	u	4	0	1
<zero fill>	125	126	i	2	0	1
Record Number of Status Change (if 0, none occurred)	127	128	u	2	0	1

Second Instrument Status (if previous word is 0, no change)	129	132	u	4	0	1
Count of Data Records in this Data Set	133	134	u	2	0	1
Count of Calibrated, Earth Located Scan Lines in this Data Set	135	136	u	2	0	1
Count of Missing Scan Lines	137	138	u	2	0	1
Count of Data Gaps in this Data Set	139	140	u	2	0	1
Count of Data Frames Without Frame Sync Word Errors	141	142	u	2	0	1
Count of PACS Detected TIP Parity Errors	143	144	u	2	0	1
Sum of All Auxiliary Sync Errors Detected in the Input Data	145	146	u	2	0	1
Time Sequence Error (0 = none; otherwise the record number of the first occurrence)	147	148	u	2	0	1
Time Sequence Error Code These are bit flags taken from Scan Line Quality Flags Time Problem Code on data record reported in Time Sequence Error field above.  If a bit is on (=1) then the statement is true.  bits 15 - 8: <zero fill> bit 7: time field is bad but can probably be inferred from the previous good time. bit 6: time field is bad and can't be inferred from the previous good time. bit 5: this record starts a sequence that is inconsistent with previous times (i.e., there is a time discontinuity). This may or may not be associated with a spacecraft clock update. bit 4: start of a sequence that apparently repeats scan times that have been previously accepted. bits 3 - 0: <zero fill>	149	150	u	2	0	1
SOCC Clock Update Indicator (0 = none during this orbit; otherwise the record number of the first occurrence)	151	152	u	2	0	1
Earth Location Error Indicator (0 = none during this orbit; otherwise the record number of the first occurrence)	153	154	u	2	0	1

Earth Location Error Code These are bit flags taken from Scan Line Quality Flags Earth Location Problem Code on data record reported in Earth Location Error Indicator field above.  If a bit is on (=1) then the statement is true.  bits 15 - 8: <zero fill> bit 7: not earth located because of bad time; earth location fields zero filled. bit 6: earth location questionable because of questionable time code. (See time problem flags.) bit 5: earth location questionable -- only marginal agreement with reasonableness check. bit 4: earth location questionable -- fails reasonableness check. bit 3: earth location questionable because of antenna position check [rs060794.doc & rs062094.do1] bits 2-0: <zero fill>	155	156	u	2	0	1
PACS Status Bit Field bits 15-3: <zero fill> bit 2: pseudo noise (0 = normal data; 1 = P/N data) bit 1: tape direction (0 = time decrementing) bit 0: data mode (0 = test data; 1 = flight data)	157	158	u	2	0	1
PACS Data Source 0 = unused; 1 = Fairbanks, AK; 2 = Wallops Island, VA; 3 = SOCC; 4=Svalbard, Norway; 5=Monterey, CA	159	160	u	2	0	1

<b>NAVIGATION</b>						
Reference Ellipsoid Model ID The ellipsoid is a mathematically tractable approximation of the geoid, which is an equipotential surface at mean sea level. The maximum departure of the ellipsoid from the geoid is approximately $\pm 65$ meters. (WGS-72 = World Geodetic Survey 1972) JGM3 =Joint Gravity Model 3	401	408	c	8	0	1

**Notes (Revision History):**

- 1) 12 Nov 1998 (NOAA-15 Orbit B0260303): Add bias correction and transmitter power fields; adjust trailing zero fill.
- 2) 04 Mar 1999 (NOAA-15 Orbit B0419595): Add “new” biera correctionsl rename bias correction Cold and Warm Cal FOV to Space and Warm View ,respectively; adjust trailing zero fill.

8.3.1.7.2.2 NOAA-N Format (Version 4, post-January 25, 2006, All Spacecraft)

The AMSU-B Data Set Header Record format for version 4 after January 25, 2006 for NOAA 15, -16, and -17 is documented in Table 8.3.1.7.2.2-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>Table 8.3.1.7.2.2-1. Format of AMSU-B Data Set Header Record for NOAA-N (Version 4, post-January 25, 2006, All Spacecraft).</b>

<b>LUNAR CONTAMINATION</b>								
Count of Scans Containing Lunar-Contaminated	2855	2856	i	2	1	0		

Space Views (Also, see bits 7 and 6 of "Scan Line Quality Flags [Additional Calibration Problem Code]" field in data record.) -1 = the detection algorithm for lunar contamination is turned off; 0 = the detection algorithm is turned on: no scans containing lunar-contaminated space views were found; >0 = the detection algorithm is turned on: the value in this field represents the number of scans found that contain lunar-contaminated space views.								
Lunar Angle Threshold (Any space view whose lunar angle - see "Lunar Angles" field in data record - is less than this value is flagged as being "lunar contaminated" and is not used in the calibration.)	2857	2858	u	2	1	2	degrees

### 8.3.1.8 SEM-2 Data Sets

This section describes the data characteristics and data format of Space Environment Monitor (SEM/2) data. The data stream is processed by NESDIS into NOAA Level 1b format and delivered electronically to NOAA's Space Environment Center (SEC) in Boulder, Colorado. SEC reformats the data and is responsible for archiving and distributing the data. As such, the NOAA Level 1b format described in this section is ephemeral and should not be used for data retrieved from the SEC archive.

#### 8.3.1.8.1 Data Characteristics

NESDIS extracts SEM-2 Minor Frame data from words 20 and 21 of the TIP Minor Frame telemetry at a rate of twenty 8-bit words per second. The characteristics of the SEM-2 instrument are summarized in Table 1.2.2.4-1.

### 8.3.1.8.2 Header Records

The SEM-2 Data Set Header Record format is documented in Table 8.3.1.8.2-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>Table 8.3.1.8.2-1. Format of SEM-2 Data Set Header Record.</b>

<b>NOTES:</b>							
1. CPIDS refers to a comprehensive calibration data set and these bytes provide the year and day of year of the latest data set update.							
2. If the contents of status1 or status2 change during the course of this data set, bytes 119-120 contain the data record number of that change. Bytes 121-124 contain the contents of status1 and status2 after that change with the bit assignments in bytes 113-116. Normally a change in the contents of status1 and status2 is associated with an in-flight calibration.							
3. Bytes 125-126 contain the number of 2-second SEM data records in this incremental file. Bytes 129-130 contain the number of TIP minor frames within this incremental file that did not have sync errors. If there were no sync error records, the integer number in bytes 129-130 should be exactly 20 times the integer number in bytes 125-126 because there are 20 TIP minor frames in each 2-second data record. If sync errors are present, the value of bytes 129-130 will be less than 20 times the integer value of bytes 125-126.							
4. This is not used in SEM processing.							
5. A survey of header files shows the eccentricity (and the semi-major axis) varies a great deal day to day. The orbit eccentricity given in the 2-line NORAD orbit elements obtained from <a href="http://celestrak.com/NORAD/elements/noaa.txt">http://celestrak.com/NORAD/elements/noaa.txt</a> do not show nearly that variation and the NORAD eccentricities generally do not agree with those obtained from this header record. There is no explanation for this.							
6. These values are in earth-centered inertial coordinates. That is, the Z axis directed north parallel to earth's axis of rotation, X axis directed toward the vernal equinox, and the Y axis completing the right handed Cartesian coordinate system.							

7. The coordinate system is earth-centered inertial.

### 8.3.1.8.3 Data Records

A sequence of SEM data records follow the header record in an incremental file. Usually an incremental file contains about one orbit's data or about 6000 seconds. A single physical 512 byte data record in the file contains two seconds of data so that each incremental file contains about 3000 physical data records. Each two second data record contains 20 TIP minor frames of data, parsed so that the first minor frame is always mod 020. That is, the first TIP minor frame in each data record is either 000, 020, 040, 060, 080, 100, 120, 140, 160, 180, 200, 220, 240, 260, 280 or 300. Table 8.3.1.8.3-1 contains a byte-by-byte description of the contents of an incremental file data record.

The SEM-2 Data Record format is documented in Table 8.3.1.8.3-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>Table 8.3.1.8.3-1. Format of SEM-2 Data Record.</b>							
<b>FRAME INFORMATION</b>	<b>Start Octet</b>	<b>End Octet</b>	<b>D T</b>	<b>Word Size</b>	<b>Number of Words</b>	<b>SF</b>	<b>Notes</b>
TIP Major Frame number (0 to 7)	1	2	u	2	1	0	
TIP Minor Frame Number (cyclic: 0, 20,...,280,300; at start of this 2-second data record)	3	4	u	2	1	0	
Minor Frame Year (at start of this 2-second data record)	5	6	u	2	1	0

<b>FILLER</b>							
<zero fill>	167	512	i	2	173	0	
<b>NOTES:</b> 1. The direction of satellite travel is required for calculation of sensor look angles with respect to the geomagnetic field. 2. A survey of the data in the incremental files shows that bytes 49-52 are always zero and it seems that satellite attitude quality flags are not introduced in the SEM-2 incremental data file. 3. A survey of the data in the incremental files shows that bytes 53-62 are always zero and it seems that satellite attitude status data are not introduced in the SEM-2 incremental data file.							

An extensive survey of SEM incremental data files was done to verify this documentation. Of the bytes between 29 and 62 inclusive, that include navigation error flags and information about the Euler angles, only bytes 29, 34, and 36, ever show values other than 000. The conclusion is that navigation/attitude status flags (bytes 49-52) and Euler angle information (bytes 53-62) are not provided.

Moreover, certain bits in bytes 29, 34 and 36, that are defined as providing status, never seem to be used. Specifically, bit 3 in byte 29 (first good time following a spacecraft clock update) is never set to 1; bit 8 in byte 34 (time is bad but probably can be inferred from previous time) nor bit 5 in byte 34 (this time starts a sequence that duplicates previous times) are never set to 1; bit 6 in byte 36 (earth location questionable - marginal agreement with reasonableness check) nor bit 5 in byte 36 (earth location questionable - fails reasonableness check) are never set to 1.

The study did confirm that bit 2 in byte 29 (SEM instrument status changed beginning this frame) is a reliable indicator of when the TED or MEPED are undergoing IFC. The combination of bit 8 in byte 29 (this 2-second frame is not valid) set to 1, bit 7 in byte 29 (time sequence error in this 2-second frame) set to 1, bit 4 in byte 29 (earth location data not available) set to 1, and bit 8 in byte 36 (no earth location because of bad time) set to 1 proves to be a reliable indicator of zero fill in the earth location field (bytes 65 to 72).

Information about when the magnetic torque coils were energized, a procedure required to maintain spacecraft attitude control, was introduced into the SEM data record. This was done because of concern that when the coils were energized the measurement of low energy particles by the TED would be compromised. The analysis to determine whether or not the TED observations are influenced by the torque coils has not been done. However, it was verified that data in bytes 162-165 do reflect those times when the roll/yaw and pitch coils are energized and so that analysis of any impact on TED can be done.

### 8.3.1.9 MHS Data Sets

This section describes the characteristics and format of Microwave Humidity Sounder (MHS) data sets.

- Section 8.3.1.9.1 Data Characteristics
- Section 8.3.1.9.2 Header Records
- Section 8.3.1.9.3 Data Records

#### 8.3.1.9.1 Data Characteristics

The Microwave Humidity Sounder (MHS) replaced AMSU-B on NOAA-N and -N', and is flown on the Metop series satellites. Since it shares some commonality with the AMSU-B instrument, the AMSU-B Level 1b format was maintained as much as possible. For example, a number of MHS Level 1b fields that are similar to AMSU-B Level 1b fields (e.g., calibration coefficients, earth location data, and earth FOV counts) have the same byte offsets as their corresponding AMSU-B fields. Also, the MHS Level 1b record length is 3,072 bytes, which is the same as the AMSU-B Level 1b record length. However, in addition to some obvious telemetry differences, nomenclature used by the instrument manufacturer in MHS documentation is used in this document for consistency. For example, the channels on MHS are referred to as H1, H2, H3, H4 and H5, as opposed to channels 16, 17, 18, 19 and 20, respectively, on AMSU-B.

The MHS instrument, and its associated interface unit (the MIU) on the NOAA satellites, can operate in a variety of different modes and output several different packets, or formats, of data. The MHS Level 1b format given in this document is applicable for any mode of the MHS instrument and for the “nominal” modes of the MIU, i.e., the modes in which the MIU passes through its received MHS data without replacement with its own telemetry data. The MHS Level 1b data will not contain any MIU telemetry. (Note: the MIU is a NOAA-specific piece of hardware. Therefore, references to the MIU and how it affects the data stream are only applicable to the MHS data from the NOAA satellites.)

Table 8.3.1.9.1-1 shows the nine MHS modes in which packet data is output and the three types of packets that are output in these modes.

<b>Table 8.3.1.9.1-1. MHS modes.</b>	
MHS Mode	MHS Output
Power-on	Empty Science Data Packet
Warm-up	Empty Science Data Packet
Standby	Empty Science Data Packet
Scan	Science Data Packet
Fixed View	Science Data Packet
Self-test	Extended Test Data Packet
Safeing	Empty Science Data Packet
Fault	Empty Science Data Packet
Memory Dump	Extended Memory Data Packet

An empty science data packet has the same format as the science data packet. However, except for the initial 39 bytes of housekeeping data, the packet is empty - i.e., zero filled. In fixed view mode, the instrument is not scanning, but is set, or fixed, at one view position. Therefore, all of its normal views of earth, space, and the on-board calibration target (OBCT) are of this fixed view position instead. When an empty science data packet is received or when the instrument is in fixed view mode, calibration is unable to be performed. Therefore, scans generated in either of these two situations are marked as unusable.

Technically, memory dump mode is not an actual mode of the MHS. Instead, the MHS can be commanded to perform a memory dump during most of its modes. The extended memory data packet generated during a memory dump supersedes the packet normally output during that particular mode. For the sake of simplicity, this document treats memory dump mode as a unique MHS mode.

According to Table 8.3.1.9.1-1, when MHS is in "self-test" mode or "memory dump" mode, it will output an extended test data packet or extended memory dump packet, respectively. In all other modes, including "scan" mode, it will output a (possibly empty) science data packet. The instrument will normally be in "scan" mode. Each different type of packet output by MHS results in a different type of data record output to the MHS Level 1b data set. This document provides Level 1b format specifications for all three types of data records. However, no matter the type of data record, they all share the same basic three-part organization: a header section, a packet data section, and a trailer section. The format of the header and trailer sections are identical across the three types of data records. The header section is composed of the first 29 bytes of the data record, which comprise the fields "Scan Line Number" through "Scan Line Quality Flags [Time Problem Code]", inclusively. The trailer section is composed of the last 238 bytes of the data record, which begins with the field "Main Bus Select Status" and continues through the "<zero fill>" padding at end of record. The content and format of the packet data section varies depending on the type of data record. In all cases though, the actual data from the particular MHS packet within this section begins at the same byte offset (1481). Additionally, in the case of data records containing either extended test data packets or extended memory data packets, the packet data is inserted exactly as received from the spacecraft without modification. (Some of the data in a science packet is slightly

re-ordered, to align with common fields of the AMSU-B Level 1b data record, with a few additional fields inserted.)

As mentioned above, an empty science data packet and a science data packet have the same format. The difference is that most of the content of an empty science data packet is, as its name implies, empty. In terms of a Level 1b data record containing an empty science data packet, the following fields are zero filled (empty):

- "Scene (Earth View) Data" (bytes 1481-2560) through "OBCT View Position Validity Flags" (bytes 2686-2686)
- "Status Word" (byte 2727) through "Science Packet Spare Words" (bytes 2787-2831)

However, an empty science data packet does contain valid housekeeping data. So, in a data record containing an empty science data packet, the "Mode and Sub-commutation Code" field (byte 2687) through the "Raw Current Consumption Data" field (bytes 2720-2725) contain valid data.

#### 8.3.1.9.2 Header Records

The MHS Primary Header Record format is documented in Table 8.3.1.9.2-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>Table 8.3.1.9.2-1. MHS Primary Header Record Format.</b>

Survival Temperature Coefficient 5	853	856	i	4	1	6	K/volt <sup>5</sup>	
<b>ANTENNA POSITION CONVERSION</b>								
Antenna Position Conversion Factor (for converting "mid-pixel position" data of earth, space, and OBCT views to degrees)	857	860	u	4	1	8	degrees/count	
value = 7.2/1024 = 0.00703125 degrees/count								
<b>PRT CALIBRATION CHANNELS</b>								
PIE-A Calibration Channel 1 Resistance	861	864	i	4	1	4	ohms	
PIE-A Calibration Channel 2 Resistance	865	868	i	4	1	4	ohms	
PIE-A Calibration Channel 3 Resistance	869	872	i	4	1	4	ohms	
PIE-B Calibration Channel 1 Resistance	873	876	i	4	1	4	ohms	
PIE-B Calibration Channel 2 Resistance	877	880	i	4	1	4	ohms	
PIE-B Calibration Channel 3 Resistance	881	884	i	4	1	4	ohms	
<b>LUNAR CONTAMINATION DETECTION</b>								
Lunar Angle Threshold (Any space view whose lunar angle--see "Lunar Angles" field in data record--is less than this value is flagged as being "lunar contaminated" and is not used in the calibration.)	885	886	u	2	1	2	degrees	
<b>RFI CORRECTION</b>								

Bias Correction Values (ordered by channel, FOV, and transmitter) Word 1: Channel H1, FOV 1, STX_1 Word 2: Channel H2, FOV 1, STX_1 Word 3: Channel H3, FOV 1, STX_1 Word 4: Channel H4, FOV 1, STX_1 Word 5: Channel H5, FOV 1, STX_1 Word 6: Channel H1, FOV 5, STX_1...(channel values for FOVs 5, 10, 15, ... , 90)...Word 95: Channel H5, FOV 90, STX_1 Word 96: Channel H1, space view, STX_1...Word 100: Channel H5, space view, STX_1 Word 101: Channel H1, OBCT view, STX_1...Word 106: Channel H1, FOV 1, STX_2...Word 211: Channel H1, FOV 1, STX_3...Word 316: Channel H1, FOV 1, SARR...Word 420: Channel H5, OBCT view, SARR	887	1726	i	2	420	0	counts	1
<zero fill>	1727	1734	i	4	2	0		
Transmitter Reference Power (mean power at the time bias corrections were derived. Range: 0 to 255, representing analog voltages from 0 to 5.1.) Word 1: STX-1 Word 2: STX-2 Word 3: STX-3 Word 4: SARR	1735	1742	i	2	4	1	counts	1
<zero fill>	1743	1752	i	2	5	0		
<zero fill> (for NOAA-originated MHS data, these fields are spare)	1753	1788	i	2	13	0		
<b>FILLER</b>								
<zero fill>	1789	3072	i	2	642	0		
<b>NOTES:</b>								
1) The RFI/bias correction data is based on experience with the AMSU-B instrument from the NOAA KLM series of satellites. While it may not be necessary, it is being left in the MHS Level 1b format. Until a determination is made that it is necessary, it will be zero filled.								

### 8.3.1.9.3 Data Records (Version 3, post-April 28, 2005, All Spacecraft)

The MHS instrument and its associated interface unit (MIU) on the NOAA satellites can operate in a variety of different modes and output several different packets, or formats, of data. This section describes the different packets that the MHS instrument outputs.

#### 8.3.1.9.3.1 Science Packet

The MHS Level 1b Record Format (Science Packet) is documented in Table 8.3.1.9.3.1-1. See Section 8.3.1.1 for further explanation of the headings on this table.

**Table 8.3.1.9.3.1-1. Format of MHS Level 1b Record (Science Packet).**

Field Name	Start Octet	End Octet	Data Type	Word Size	Number of Words	Scale Factor	Units	Notes
<b>SCAN LINE INFORMATION</b>								

Scan Line Number ( <i>cumulative, starting with 1</i> )	1	2	u	2	1	0	
Scan Line Year ( <i>four digits, e.g., 2000</i> )	3	4	u	2	1	0	
Scan Line Day of Year ( <i>e.g., 365</i> )	5	6	u	2	1	0	
Satellite Clock Drift Delta	7	8	i	2	1	0msec	
Scan Line UTC Time of Day	9	12	u	4	1	0msec	
Scan Line Bit Field bit 15: satellite direction (0=northbound; 1=southbound) bit 14: clock drift correction (0=not corrected; 1=scan time corrected for clock drift) bits 13-0: <zero fill>	13	14	u	2	1	0	
Major Frame Count ( <i>cumulative, starting with 1</i> )	15	16	u	2	1	0	
Coarse MHS On-board Time (OBT) ( <i>time since last reset to zero</i> )	17	20	u	4	1	0seconds	
Fine MHS OBT ( <i>fraction of second since last increment of coarse MHS OBT. Resolution: 2<sup>-16</sup> seconds; range: 0 - 65,535.</i> )	21	22	u	2	1	0	
MHS Mode Flag 0=power-on ("empty" MHS science data) 1=warm-up ("empty" MHS science data) 2=standby ("empty" MHS science data) 3=scan (valid MHS science data) 4=fixed view (valid MHS science data, but instrument is viewing a fixed location) 5=self test (test data) 6=safeing ("empty" MHS science data) 7=fault ("empty" MHS science data) 8-14=<undefined> (unknown data) 15=memory dump (memory dump data) <zero fill>	23	23	u	1	1	0	
<b>QUALITY INDICATORS</b>							
Quality Indicator Bit Field ( <i>if a bit is on (=1), the statement is true</i> ) bit 31: do not use scan for product generation bit 30: time sequence error detected within this scan (see below) bit 29: data gap precedes this scan (gap may be due to actual lost scans or scans in which the TIP or MIU are in non-nominal modes) bit 28: insufficient data for calibration (see below) bit 27: earth location data not available (see below) bit 26: first good time following a clock update (nominally 0) bit 25: instrument status changed with this scan bits 24 -5: <zero fill> bit 4: transmitter status change occurred (see note 2) bit 3: AMSU sync error detected bit 2: AMSU minor frame error detected bit 1: AMSU major frame error detected bit 0: AMSU parity error detected	25	28	u	4	1	0	2

<p>Scan Line Quality Flags [Time Problem Code] <i>(If a bit is on (=1), the statement is true. All bits off implies the scan time is as expected.)</i></p> <p>bit 7: time field is bad but can probably be inferred from the previous good time</p> <p>bit 6: time field is bad and can't be inferred from the previous good time</p> <p>bit 5: this record starts a sequence that is inconsistent with previous times (i.e., there is a time discontinuity). This may be associated with a spacecraft clock update. (See bit 26, Quality Indicator Bit Field.)</p> <p>bit 4: start of a sequence that apparently repeats scan times that have been previously accepted</p> <p>bits 3-0: &lt;zero fill&gt;</p>	29	29	u	1	1	0		
<p>Scan Line Quality Flags [Calibration Problem Code] <i>(If a bit is on (=1), the statement is true. These bits complement the channel indicators; all bits set to 0 indicates normal calibration.)</i></p> <p>Word 1</p> <p>bits 7-2: &lt;zero fill&gt;</p> <p>bit 1: scan line contains one or more space views that are lunar contaminated</p> <p>bit 0: lunar-contaminated scan line was able to be calibrated (only applicable if the previous flag [bit 1] is 1; otherwise, zero)</p> <p>Word 2</p> <p>bit 7: scan line was not calibrated because of bad time</p> <p>bit 6: scan line was calibrated using fewer than the preferred number of scan lines because of proximity to start or end of data set or to a data gap</p> <p>bit 5: scan line was not calibrated because of bad or insufficient PRT data</p> <p>bit 4: scan line was calibrated but with marginal PRT data</p> <p>bit 3: some uncalibrated channels on this scan (see channel indicators)</p> <p>bit 2: uncalibrated due to instrument mode</p> <p>bit 1: questionable calibration because of antenna position error of space view</p> <p>bit 0: questionable calibration because of antenna position error of OBCT view</p>	30	31	u	2	1	0		
<p>Scan Line Quality Flags [Earth Location Problem Code] <i>(If a bit is on (=1), the statement is true. All bits set to 0 implies the earth location was normal.)</i></p> <p>bit 7: not earth located because of bad time; earth location fields zero-filled</p> <p>bit 6: earth location questionable: questionable time code (see time problem flags above)</p> <p>bit 5: earth location questionable: marginal agreement with reasonableness check</p> <p>bit 4: earth location questionable: fails reasonableness check</p> <p>bit 3: earth location questionable because of antenna position</p> <p>checkbits 2-0: &lt;zero fill&gt;</p>	32	32	u	1	1	0		

Calibration Quality Flags ( <i>all bits off implies a good calibration</i> ) Word 1: Channel H1 bits 15-7: <zero fill> bit 6: this scan line is either the last one before or the first one after a sudden, anomalous jump (or drop) in calibration counts bit 5: all bad OBCT view counts for scan line bit 4: all bad space view counts for scan line bit 3: all bad PRTs for this line bit 2: marginal OBCT view counts for this line bit 1: marginal space view counts for this line bit 0: marginal PRT temps on this line Words 2-5: Channels H2-H5 (in order)	33	42	u	2	5	0		
<zero fill>	43	60	i	2	9	0		
<b>CALIBRATION COEFFICIENTS</b>								
<i>Note: The following coefficients are only available in Scan and Fixed View modes otherwise the coefficient fields are &lt;zero fill&gt;. Refer to bits 7-4 of the Mode and Sub-commutation Code field for the current mode.</i>

<b>FILLER</b>								
<zero fill>	2869	3072	i	2	102	0		

**NOTES:**

1. The MHS Level 1b data will not contain any MIU related analog or digital B telemetry items from the NOAA data stream. These items will be archived in a separate NOAA telemetry file.
2. To determine the word location and bit location within the word of a particular FOV's validity flag, use the following equations:  
word = truncate((FOV - 1) / 8) + 1; bit = (FOV - 1) mod 8  
For example, FOV 64's validity flag is located in bit 7 of word 8, computed as follows : word = truncate (64 - 1) / 8) + 1 = truncate (63 / 8) + 1 = truncate (7.875) + 1 = 7 + 1 = 8; bit = (64 - 1) mod 8 = 63 mod 8 = 7.
3. The limits are defined in the Telemetry Limits Table, which is loaded into the instrument's memory. This table can be found in Appendix B of *MHS TM-TC and Science Data Format Directory*, and in Table 3.2.2.2.9-3 of *MHS Instrument ICD*. There are two levels of limits: "warning" limits and "fault" limits. If a telemetry item goes outside of the "warning" limits, then this bit is set. If the telemetry item goes outside of the "fault" limits, then an error flag is raised in the "fault code" field and the instrument switches to "fault" mode.
4. This bit is related to the Earth/Space/OBCT View Position Validity Flags. It is set by the instrument and comes in the data stream. The Position Validity Flags are set by the preprocessor. If this bit is set, then at least one bit of the Position Validity Flags should be set also.

## 8.3.1.9.3.2

Extended Test Data Packet

The MHS Level 1b Record Format (Extended Test Data Packet) is documented in Table 8.3.1.9.3-2. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>Table 8.3.1.9.3.2-1. Format of MHS Level 1b Record (Extended Test Data Packet).</b>								
Field Name	Start Octet	End Octet	Data Type	Word Size	Number of Words	Scale Factor	Units	Notes
<b>SCAN LINE INFORMATION</b>

<b>NOTES:</b>								
1. The MHS Level 1b will not contain any MIU-related analog or digital B telemetry items from the NOAA data stream. These items will be archived in a separate NOAA telemetry file.								
2. The RFI bias correction data is based on experience with the AMSU-B instrument from the NOAA KLM series of satellites. While it may not be necessary, it is being left in the MHS Level 1b format. Until a determination is made that it is necessary, it will be zero filled.								
3. Refer to Section 4.3.2.3 of <i>MHS TM-TC and Science Data Format Directory</i> for a detailed description of the content of this field.								

### 8.3.1.9.3.3 Extended Memory Data Packet

The MHS Level 1b Record Format (Extended Memory Data Packet) is documented in Table 8.3.1.9.3.3-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

<b>NOTES:</b>								
<p>1. The MHS Level 1b will not contain any MIU-related analog or digital B telemetry items from the NOAA data stream. These items will be archived in a separate NOAA telemetry file.</p> <p>2. The RFI bias correction data is based on experience with the AMSU-B instrument from the NOAA KLM series of satellites. While it may not be necessary, it is being left in the MHS Level 1b format. Until a determination is made that it is necessary, it will be zero filled.</p> <p>3. Refer to Section 4.3.2.2 of <i>MHS TM-TC and Science Data Format Directory</i> for a detailed description of the content of this field.</p>								

### 8.3.1.9.3.4 Unknown Packet

If the mode code in the MHS data stream is missing or corrupt, the mode of the instrument (and therefore the type of packet) is unknown. If this is the case, the packet data is placed into this field without modification. The MHS unknown packet is documented in Table 8.3.1.9.3.4-1. See the legend in Section 8.3.1.1 for further explanation of the headings on this table.

## 9.0 NESDIS OPERATIONAL PRODUCTS

Please note that this section is outdated. For the latest information and access to NESDIS operational products please go to <http://www.nesdis.noaa.gov/>.

The following products are generated from the NOAA KLM Level 1b data and are further described in this section:

- Sea Surface Temperature (SST) Products
- Mapped GAC Products
- Radiation Budget Products
- Sounding Products
- CoastWatch Products
- Snow and Ice Products
- Ozone (SBUV/2) Products
- Aerosol/Optical Thickness Products
- Comprehensive Large Array-data Stewardship System (CLASS)

### 9.1 SEA SURFACE TEMPERATURE (SST) PRODUCTS

NOAA/NESDIS produces and archives two types of SST products, gridded products and geographically organized retrievals. In addition, through an agreement under the NOAA/DOD Shared Processing Program, NESDIS receives and archives global Sea Surface Temperature retrievals from the Naval Oceanographic Office at Stennis Space Center, Mississippi. Both the NESDIS and Navy retrieval Archive cartridges contain eight days of 8-km resolution SST observations from a current operational NOAA polar orbiter (normally the afternoon spacecraft). All gridded products are produced from the 8-km resolution observations. Monthly archives are produced for all the gridded products. They include daily 100-km (Global-Scale Analysis), bi-weekly 50 km (Regional Scale Analysis), and biweekly 14 km (Local Scale) gridded SST fields. Monthly means are also produced from the observations on a 250-km grid (SST Monthly Mean) and archived yearly.

Any queries regarding SST products should be directed to:

National Climatic Data Center  
Climate Services Division  
151 Patton Avenue  
Asheville, NC 28801-5001  
email: [NCDC.satorder@noaa.gov](mailto:NCDC.satorder@noaa.gov)

The 14-km gridded, 50-km gridded, and 100-km gridded SST fields are generated by NESDIS in the SST Field Format which is described in Section 9.1.1. Section 9.1.2 describes the SST

Observation File and the SST Monthly Mean is described in Section 9.1.3.

Most SST archive cartridges contain a Header File which will usually be the first file on the cartridge. The Header File consists of one 400-byte physical record which contains some of the information shown in Table 9.1-1.

<b>Table 9.1-1. Format of the SST Header File</b>			
<b>Word #</b>	<b># Bytes</b>	<b>Content</b>	<b>Range</b>
1-20	80	Title of data set archived in File 2 of this cartridge	1-80 characters with blank fill
21-27	28	Data set name of disk data set	1-28 characters with blank fill
28-29	8	Original archive cartridge number	1-8 characters with blank fill
<b>Date of earliest data on cartridge:</b>			
30	1	Year	0-99
	1	Month	1-12
	1	Day	1-31
	1	Blank	
<b>Date of most current data on cartridge:</b>			
31	1	Year	0-99
	1	Month	1-12
	1	Day	1-31
	1	Blank	
<b>Date and time when data was archived from disk to cartridge:</b>			
32	4	Year	0-99
33	4	Month	1-12
34	4	Day	1-31
35	4	Hour	0-23

36	4	Minute	0-59
37	4	Second	0-59
38	4	Number of records of data in File 2 of cartridge	n/a
39	4	Number of files of data on the cartridge (not counting Header file)	n/a
40-100	244	Spare	n/a

### 9.1.1 SST FIELD FORMAT

All of the SST Field products including the 14-km gridded (0.125 degree), 50-km gridded (0.5 degree), and 100-km gridded (1 degree) are derived from the basic 8-km SST observations. An SST Field consists of a specific set of information pertaining to latitude and longitude intersections. The Global-Scale (1 degree resolution) file includes the area from 180W to 179E longitude and from -70S to 70N latitude and is generated daily. The regional scale (0.5 degree) and local scale (0.125 degree) fields are generated twice weekly. All the fields are generated by analyzing all the SST observations obtained during the period since the last analysis.

As mentioned in the previous section, most SST archive cartridges contain a header file which is usually the first file on the cartridge. The remaining files on the cartridge are field accumulation files.

Before September 2001, all field accumulation files (regardless of resolution) consisted of a Directory Record followed by some number of fields. For field data after September 2001, the individual fields are no longer stored in accumulation files. Therefore, the field accumulation Directory Record was eliminated, and multiple field files are no longer bundled into one big file. Field files are now archived as individual fields and thus the rest of the format (field documentation record and field data records) remains the same. Each field consists of a Field Documentation Record, followed by a Field Data Record for each latitude row in the field. The accumulation file Directory Record (which exists prior to September 2001 only) includes, among other things, the starting record number (i.e., the record number of the Field Documentation Record) for each field in the accumulation file. Details of the Directory Record, Field Documentation Record and Field Data Records are contained in Sections 9.1.1.1, 9.1.1.2 and 9.1.1.3, respectively. Data records (latitude rows) in the fields are ordered from south to north.

The fields will generally be arranged in chronological order. A field for a particular time period may be missing or repeated so one should examine the Field Documentation Record for each field in the file to find that field spanning the time of interest. The Field Documentation Record (the first record of each field) should be used in referencing the data records for the field, since it

provides information concerning the organization, size, and time period of the field.

After the Directory Record, there are NFIELDS fields. The first record of each field is a Field Documentation Record which is followed by NRECS Field Data Records, one for each latitudinal row in the field. Each row (logical record) consists of 28 bytes of information for each longitude or column forming a grid intersection, plus 28 bytes at the end of the record (the Latitudinal Row Identifier) containing the row number identification and the date and time of the last analysis made for the field.

The 100-km SST field cartridge is generated monthly (on the second day of the month). The cartridge contains two files: File 1 is the Header File (Table 9.1-1). File 2 is the 100-km SST field accumulation file. In File 2, after the Directory Record, there are 35 fields, 142 logical records per field. These fields are produced daily. Each field contains the Field Documentation Record followed by 141 Field Data Records, one for each 1 degree latitudinal row from -70S to 70N. There are 360 grid intersections in each row, one for each 1 degree of longitude from -180 W eastward to 179E. Each Field Data Record (logical record) contains 10,108 bytes ((360 x 28) + 28 for row identification).

The 50 km gridded SST field accumulation files are archived to cartridge once a month (on the second day of each month) for the previous month. File 1 is a Header File (Table 9.1-1), while files 2-6 contain the field accumulation files for regions 1 through 5 respectively (one geographic region per file). Each field accumulation file contains 10 fields. These fields are produced twice a week by analyzing all the SST observations obtained since the last analysis. The five regions are defined as follows:

Region 1:	5N through 53N latitude -100W through -52W longitude
Region 2:	15N through 63N latitude -145W through -97W longitude
Region 3:	15N through 63N latitude +170E through -142W longitude
Region 4:	-35S through 20N latitude -150W through -70W longitude
Region 5:	-35S through 20N latitude +155E through -145W longitude

The 14-km (0.125 degree) gridded SST fields (Local-Scale Analyses) are archived monthly on two cartridges. There are eight 0.125 degree resolution fields which cover the following areas:

Region 2:	18N through 31N latitude -98W through -80W longitude
Region 4:	39N through 52N latitude -136W through -123W longitude
Region 5:	28N through 41N latitude +155E through -145W longitude
Region 6:	30N through 36N latitude -82W through -60W longitude
Region 7:	18N through 32N latitude -85W through -70W longitude
Region 10:	50N through 62N latitude (Seasonal) -160W through -126W longitude
Region 11:	50N through 70N latitude (Seasonal) -180W through -157W longitude
Region 12:	20N through 32N latitude -136W through -105W longitude

The first cartridge of the 14-km gridded SST field data contains Regions 2, 4, 5, 6, and 7 which cover the Gulf of Mexico, Northwest Pacific coast, Southwest Pacific coast, Northeast Atlantic coast, and Southeast Atlantic coast, respectively. This cartridge contains six files, the first file being the Header File. Files two through six contain the 14-km field accumulation files for Regions 2,4,5,6, and 7, respectively. Each accumulation file contains twelve fields (2 per week) ordered chronologically.

The second cartridge of the 14-km gridded SST data contains Regions 10, 11 and 12 which cover the Gulf of Alaska, Bering Sea and the Gulf of California, respectively. This cartridge contains four files, the first file being the Header File (Table 9.1-1). The second, third and fourth files contain the 14-km field accumulation files for Regions 10, 11 and 12, respectively. Each accumulation file contains twelve fields (2 per week) ordered chronologically.

Beginning with data from NOAA-16 on February 21, 2001, a new 14-km SST Field encompasses all but Regions 10 and 11, listed above. This is considered the new North American field (14 km NA ETA Field). This region corresponds to the ETA model's grid for North America and should be very useful for modeling and Climatological purposes. The region itself consists of an area that extends from 15N to 60N and 50W to 140W. This field is produced

on odd days of the year by analyzing all the SST observations obtained in the previous two days. The 14 km NA ETA Field contains 18 files organized chronologically. The first physical record of the file is a directory record pointing to the beginning of each of the 18 fields. Each field of the file contains  $1 + (18 \times 361) = 6499$  logical records blocked into 6499 physical records in the file.

The original SST field formats were not Year 2000 (Y2K) compliant, but have been changed to meet the four-digit year requirement. These changes are noted in the appropriate locations in the format records.

Starting with data generated on or about September 2, 2001, all the field accumulation files will be discontinued. They will be replaced by individual field data files (as opposed to bundling several fields' files into accumulation files). Specifically: the 100-km field accumulation file that is archived monthly will be replaced by a 100-km field file archived daily; the 50-km field accumulation Regional files that are archived monthly will be replaced by the new 50-km global field file which will be archived twice weekly; the 14-km field accumulation data for Regions 10 and 11 that are archived monthly will be replaced by 14-km field data including a new Hawaii region (between 10N and 30N latitude and 170W and 150W longitude) archived twice weekly; and the 14-km field accumulation data for Region 12 that are archived monthly will be replaced (encompassed) by 14-km field data archived every 48 hours or on all odd Julian days.

#### 9.1.1.1 Directory Record Format

A Directory Record is always the first record of each SST Field Accumulation File (not counting the Header File and for data generated after September 2001 which are not accumulation files but are individual field files). It has a variable length with zero fill to the logical record size of the type of field, and serves as a pointer to the beginning of each field. Table 9.1.1.1-1 contains the format of the Directory Record.

<b>Table 9.1.1.1-1. Format of the Directory Record for any SST Field Accumulation File.</b>	
<b>Full Word #</b>	<b>Content</b>
1	Number of records in the data set
2	Number of records in each field (NRECS)
3	Number of fields in the accumulation file (NFIELDSD)
4	Field number of latest field entered in accumulation file
5	Record number of first record of Field #1
6	Record number of first record of Field #2

...	...
4+NFIELDS	Record number of first record of Field #NFIELDS

### 9.1.1.2 Field Documentation Record Format

The format of the Field Documentation Record is described in this section. There are 158 words of information in the Field Documentation Record with blank fill to the end of the logical record (logical record size is dependent on number of longitude columns in the field). The minimum size is 158 words (632 bytes) and the maximum size is 2,527 words (10,108 bytes). Table 9.1.1.2-1 contains the format (where R or I indicate real or integer words, respectively) of the Field Documentation Record.

Unfortunately, the SST fields were developed when the format for IBM real numbers were thought to be the standard. Many platforms cannot read IBM real numbers and so the following variables in the Field Documentation Record: SMGLAT, AXLAT, SMLONG, ASLONG, RES, SMHOUR, HOURS, TIMGAP, SMREL, AXREL, SORC, OBTYPE, GRDWTS, MKM, H, EXP, FDX, XCLASS, DEL, BDEL and FCWT (defined in Table 9.1.1.2-1) will be unavailable without conversions. The values of the most used parameters for the 14 km NA ETA field are listed specifically in Table 9.1.1.2-1. The general user will not need the rest of the values, but for the advanced user a conversion program from IBM real numbers to IEEE real numbers is included in Appendix N.

<b>Table 9.1.1.2-1. Format of the Field Documentation Record.</b>			
<b>Word #</b>	<b>Parameter</b>	<b>R or I</b>	<b>Description</b>
1	LDBGN	I	Record number of the first row of the field (currently 2 for all fields since the documentation record requires only one record).
2	SMGLAT	R	Minimum latitude included in field which is the bottom edge and first row of field (-South; + North). 15.0 for 14 km NA ETA field.
3	AXLAT	R	Maximum latitude included in field which is the top edge and last row of field (-South; + North). 60.0 for 14 km NA ETA field.
4	SMLONG	R	Minimum longitude included in field which is the left edge and first column of field (-West; + East). -140.0 for 14 km NA ETA field.

5	AXLONG	R	Maximum longitude included in field which is the right edge and last column of field (excluding the I.D. column) (-West; +East). -50.0 for 14 km NA ETA field.
6	RES	R	Number of latitude-longitude degrees between each grid point. 0.125 for 14 km NA ETA field.
7	SMHOUR	R	Youngest time, in hours of the year, of observations used during last analysis, which becomes the oldest time allowed for the next analysis.
8	HOURS	R	Oldest time, in hours of the year, of observations used during last analysis.
9	TIMGAP	R	Number of hours between youngest and oldest times of observations used in analysis.
10	MAXDAT	I	Maximum number of hours allowed in time period for observation times to be included in analysis.
11	SMREL	R	Minimum reliability of observations to be used in analysis.
12	AXREL	R	Maximum reliability of observations to be used in analysis.
13-22	SORC(10)	R	List of source codes of observations to be used in analysis. (See Table 9.1.2-5)
23-32	OBTYPE (10)	R	List of observation types allowed to be used in analysis. (See Table 9.1.2-4)
33	NROWS	I	Number of rows (latitudinal parallels) included in field, excluding documentation record.
34	NCOLS	I	Number of columns (longitudinal meridians) in field, including the I.D. column.
35	IBLK	I	Number of rows or logical records per physical block.
36	NWRDS	I	Number of full words (32 bits) allocated to each grid point.
37	ISZ	I	Number of rows to be maintained in an array in core for temperature analysis and calculation of gradients.
38	ICENT	I	Center line within the array of ISZ rows upon which calculations will be performed.

39-41	LWT, LNT, LBT	I	Word number, length in bits, and starting bit location of analysis temperature within a grid intersection information unit of an SST field.
42-44	LWG, LNG,LBG	I	Word number, length in bits, and starting bit location of average gradient.
45-47	LWGXP, LNGXP, LBGXP	I	Word number, length in bits, and starting LBGXP bit location of gradient X+ direction.
48-50	LWGYN, LNGYN, LBGYN	I	Word number, length of bits, and starting LBGYN bit location of gradient X- direction.
51-53	LWGP, LNGP, LBGP	I	Word number, length in bits, and starting LBGP bit location of gradient Y+ direction.
54-56	LWGYN, LNGYN, LBGYN	I	Word number, length in bits, and starting LBGYN bit location of gradient Y- direction.
57-59	LWPD, LNP, LBP	I	Word number, length in bits, and starting LBP bit location of Physiographic Description.
60-62	LWNO, LNN, OLBNO	I	Word number, length in bits, and starting LBN bit location of Number Observations.
63-65	LWAGE, LNAGE, LBAGE	I	Word number, length in bits, and starting LBAGE bit location of Age of most Recent Observations.
66-68	LWREL, LNREL, LBREL	I	Word number, length in bits, and starting LBREL bit location of Reliability.
69-71	LWCLS, LNCLS, LBCLS	I	Word number, length in bits, and starting LBCLS bit location of Class 1 coverage.

72-74	LWSXP, LNSXP, LBSXP	I	Word number, length in bits, and starting LBSXP bit location of Spatial Covariance X+.
75-77	LWSXN, LNSXN, LBSXN	I	Word number, length in bits, and starting LBSXN bit location of Spatial Covariance X-.
78-80	LWSYP, LNSYP, LBSYP	I	Word number, length in bits, and starting LBSYP bit location of Spatial Covariance Y+.
81-83	LWSYN, LNSYN, LBSYN	I	Word number, length of bits, and starting LBSYN bit location of Spatial Covariance Y-.
84-86	LWIND, LNIND, LBIND	I	Word number, length in bits, and starting LBIND bit location of Independent Temperature.
87-96	GRDWTS (10)	R	Weight assigned to each grid unit, according to its distance from the grid intersection for which gradients are being calculated.
97	NP	I	Number of grid points to be used in calculation of gradients.
98-117	KMDST (10,2)	I	Look up table of gradient values and corresponding distances to be used in determining the search area for analysis.
118	MKM	R	Number of paired entries in KMDST.
119-138	H(10,2)	R	Look up table of gradient values and corresponding factors to be used in determining the new weight assigned to the observation temperature analysis.
139	MH	I	Number of paired entries in H.
140	EXP	R	Exponent used in temperature analysis.
141	FDX	R	Factor used in determining new weight assigned to the observation temperature for analysis.
142	XCLASS	R	Factor used to place gradients into a class for Gradient Class Summary.

143	DEL	R	Maximum number of degrees centigrade (x 10) that the new analysis temperature may differ from the previous SST field temperature.
144	MF	I	Factor applied to the previous field temperature and reliability to determine the final analysis temperature and its reliability.
145	MSTAR	I	Factor applied to the combined observation temperature and weight in determining the new analysis temperature.
146	MNSRCH	I	Minimum distance in kilometers to be searched for analysis observations.
147	MXSRCH	I	Maximum distance in kilometers to be searched for analysis observations.
148	BDEL	R	Maximum distance in kilometers to be searched for analysis observations. Maximum difference allowed between new analysis temperature and the previous one for Class 1 coverage bit to be set to 1.
149	FCWT	R	Maximum value that can be assigned as the reliability of the new analysis temperature.
150	IYYY	I	Year of youngest time of observation data used (0-99).
151	IYMM	I	Month of youngest time of observation data used (1-12).
152	IYDD	I	Day of youngest time of observation data used (1-31).
153	IYHH	I	Hour of youngest time of observation data used (0-23).
154	IOYY	I	Year of oldest time of observation data used (0-99).
155	IOMM	I	Month of oldest time of observation data used (1-12).
156	IODD	I	Day of oldest time of observation data used (1-31).
157	IOHH	I	Hour of oldest time of observation data used (0-23).
158	ICURTM	I	Last time used in analysis (in Julian days from Jan. 1, 4713 BC).

### 9.1.1.3 Field Data Record Format

Each Field Data Record (latitudinal row) consists of a series of grid intersection points. These points are 28 bytes in length. Each longitude (column) reflects one grid intersection. At the end

of the data record (i.e., immediately following the last column) is the 28-byte Latitudinal Row Identifier. All parameters in the grid intersection are stored as integer values and have the format shown in Table 9.1.1.3-1.

<b>Table 9.1.1.3-1. Format of the Parameters in the Grid Intersection.</b>				
<b>Word #</b>	<b>Byte #</b>	<b>Description</b>	<b>Units</b>	<b>Range</b>
1	1-2	Analysis Temperature	C x 10	-850 to +610
1	3-4	Average Gradient	C/100 km (x 10)	0 to 300
2	5-6	Gradient X+	C/100 km (x 10)	0 to 300
2	7-8	Gradient X-	C/100 km (x 10)	0 to 300
3	9-10	Gradient Y+	C/100 km (x 10)	0 to 300
3	11-12	Gradient Y-	C/100 km (x 10)	0 to 300
4	13	Physiographic Descriptor	0 = sea; 1=land	0 to 15
4	14	Ice Field	Percent sea ice for 50 km SST field, otherwise, undefined.	0 to 100 for 50 km SST field. Set to 100 for all other fields.
4	15	Number of Observations	Integer	0 to 255
4	16	Age of Most Recent Observation	Hours	0 to 255
5	17-18	Reliability	Integer	0 to 32767
5	19-20	Class 1 Coverage	Bits	0 or 1
6	21	Spatial Covariance X+	Grid units	0 to 10
6	22	Spatial Covariance X-	Grid units	0 to 10
6	23	Spatial Covariance Y+	Grid units	0 to 10
6	24	Spatial Covariance Y-	Grid units	0 to 10
7	25-26	Climatological Temperature (for 100 km field file only)	C (x 10)	-850 to +610
7	27-28	Spare	Undefined	Blank

The format of the Latitudinal Row Identifier (last 28 bytes of a row) is contained in Table 9.1.1.3-2. All parameters in the table are stored as integer values.

<b>Table 9.1.1.3-2. Format of the Latitudinal Row Identifier.</b>				
<b>Word #</b>	<b># Bytes</b>	<b>Description</b>	<b>Units</b>	<b>Range</b>
1	4	Row	Integer	1-141
2	4	Spare	Undefined	0 to 32767
3	4	Spare	Undefined	0 to 32767
4	1	Physiographic Descriptor	Integer	Always 255
4	3	Spare	Undefined	0 to 32767
<b>Date and time at which analysis was performed:</b>				
5	4	Hour of Day, Minutes of hour	100 x hours + minutes	100 x (0-23) + (0-59)
6	4	Day of Year	Days	1-366
7	4	Year (2-digits before 3/3/99; 4-digits after 3/3/99)	Years	0-99 (1999-2100 after 3/3/1999)

The terms used to describe the grid intersection points are defined as follows:

**ANALYSIS TEMPERATURE** - The latest sea surface temperature calculated based on the previous analysis temperature, weighted according to its reliability, combined with a weighted average of current observations within a surrounding area of the grid point. The surrounding area is determined according to the gradient in each direction.

**AVERAGE GRADIENT** - The average of the gradients in all four directions (N, S, E, and W) from the grid intersection.

**GRADIENT IN X+ DIRECTION** - Change in temperature between the grid point and neighbor points within the field in the positive direction along the X axis.

**GRADIENT IN X- DIRECTION** - Change in temperature in the negative direction along the X axis.

**GRADIENT IN Y+ DIRECTION** - Change in temperature in the positive direction along the Y axis.

GRADIENT IN Y- DIRECTION - Change in temperature in the negative direction along the Y axis.

PHYSIOGRAPHIC DESCRIPTOR - The land/sea tag indicating whether a grid intersection is a land or sea point.

SPARE - Unused parameter.

NUMBER OF OBSERVATIONS - The total number of current observations used in the analysis of the new temperature for the grid intersection.

AGE OF MOST RECENT OBSERVATION - The age, in hours before the time of the analysis, of the most recent observation used to determine the new temperature for a grid intersection.

RELIABILITY - New reliability associated with the new temperature, based on the previous reliability combined with the weighted reliability of all observations used in the last analysis. Larger values are more reliable.

CLASS 1 TEMPORAL COVERAGE - Set of bits (0-15) of which Bit 1 is set to 1 for each analysis which included observations with a reliability greater than or equal to a specific minimum reliability considered as Class 1. Bit 0 always remains a 0, and all bits are shifted right during each analysis leaving Bit 1 to 0 when no Class 1 reliability observations are used for a grid intersection.

SPATIAL COVARIANCE X+ - The distance in grid units from the grid intersection to the nearest land mass in the positive direction along the X axis.

SPATIAL COVARIANCE X- - The distance in grid units from the grid intersection to the nearest land mass in the negative direction along the X axis.

SPATIAL COVARIANCE Y+ - The distance in grid units from the grid intersection to the nearest land mass in the positive direction along the Y axis.

SPATIAL COVARIANCE Y- - The distance in grid units from the grid intersection to the nearest land mass in the negative direction along the Y axis.

CLIMATOLOGICAL GRID TEMPERATURE - The average sea surface temperature of a grid intersection for a particular month over a number of years, taken from the global climatology file (for 100 km field file only).

### 9.1.2 EIGHT-DAY SST OBSERVATION FILE

The current operational technique for calculating SSTs is a multichannel technique with separate

algorithms for day and night observations. This multichannel technique yields an improved resolution of 8 km. The SST Observation File contains eight days of SST observations, which are organized in 5 x 5 degree blocks. These 5 x 5 degree blocks are further subdivided into 1 x 1 degree subblocks. Global coverage requires 2,592 blocks. The block number IBLOCK for an observation located at ILAT latitude (+N,-S) and ILONG longitude (+E,-W) can be calculated using the following equation:

$$IBLOCK = \frac{(ILATA - LA)}{LAO} \times INBL + \frac{(ILONG - LO)}{LOO} + 1 \quad 9.1.2-1$$

The current operational technique for calculating SSTs is a multichannel technique with separate algorithms for day and night observations. This multichannel technique yields an improved resolution of 8 km. The SST Observation File contains eight days of SST observations, which are organized in 5 x 5 degree blocks. These 5 x 5 degree blocks are further subdivided into 1 x 1 degree subblocks. Global coverage requires 2,592 blocks. The block number IBLOCK for an observation located at ILAT latitude (+N,-S) and ILONG longitude (+E,-W) can be calculated using the following equation:

$$SBN = (ILAT - LLA) \times LOO + ILONG - LLL + 1 \quad 9.1.2-2$$

where LA is the latitude origin of the file (-90 degrees), LO is the longitude origin of the file (-180 degrees), LAO is the size of the block in the latitudinal direction (5 degrees), LOO is the size of the block in the longitudinal direction (5 degrees), and INBC is the number of column blocks (360 degrees/LOO). Each block includes the minimum whole latitude and longitude, and excludes the maximum whole latitude and longitude which borders the block. For example, the limits of Block 1 are: -90.0S to -85.01S and -180.0W to -175.01W. Since all subblocks are degree boxes, the Subblock number *SBN* for a given latitude and longitude can be defined as: where LLA and LLL are respectively the lower left latitude and longitude of the 5 degree block.

The first record in the Eight Day SST Observation File is the Block Directory which contains 13,024 bytes. The format of the Block Directory is contained in Table 9.1.2-1.

<b>Table 9.1.2-1. Format of the Block Directory record.</b>	
<b>Halfword #</b>	<b>Contents</b>
1	LA, the latitude origin of the file (range: -90)
2	LO, the longitude origin of the file (range: -180)
3	LAO, size of block in latitudinal direction (range: +5)

4	LOO, size of block in longitudinal direction (range: +5)
5	First free record pointer (points to record # of first record available as an overflow track, 0 if no more tracks available).
6	Number of records in file (3,100 initially)
7	Start of Block Directory Information in halfwords (11 initially)
8	Day of year of most recent information (range: 1-366)
9	File availability: 0=available, 1=unavailable, update in progress
10	Year of century of last data (range: 0-99)
11	Record number for Block 1 (range: 2-3,100)
12	Record number for Block 2 (0 for no data in block)
...	...

Using the block number, the record number can be calculated and found in the portion of the Block Directory which serves as a lookup table. If the record number entry is zero, there is no data for that corresponding block in the file. The record number points to the Observation Data record, of which the first portion is a subdirectory. The file contains 8,446 records of 13,024 bytes each. The Observation Data record has the format shown in Table 9.1.2-2.

<b>Table 9.1.2-2. Format of Observation Data Record.</b>		
<b>Halfword #</b>	<b>Contents</b>	<b>Range</b>
1	Record number	2 to 8446
2	Block number	1 to 2592
3	Extent number (number of records removed from primary)	0 (if primary)
4	Pointer to succeeding overflow record. Last overflow record points to primary record.	0 if no overflow
5	Pointer to halfword position of start of Observation Unit	61
6	Pointer to start of Subblock Directory	11

7	Lower left latitude of block LLA (+N,-S) in degrees	-90 to +90
8	Lower left longitude of block LLL (+E,-W) in degrees	-180 to +180
9	Pointer to last halfword containing data	1 to 6512
10	Unused	n/a
11	Halfword of start of data for Subblock #1	0 if no data for subblock 61 otherwise
12	Halfword of end of data for Subblock #1 (other extents may or may not contain data for this subblock).	1 to 6512
13-60	Similar to halfwords 11 and 12 for remaining subblocks	1 to 6512
61-6512	Observation data (observation units are variable length but usually they are 56 bytes each)	n/a

If the block size is changed in the future, a block may contain a different number of subblocks, thus changing the number of subblock pointers and the starting halfword of the Observation Unit. If the observations for a block do not fit on one record then as many records (extents) are allocated as needed. Each additional record will include the subdirectory and Observation Unit. If the subblock contains no information, then the start and end positions contain a zero. Subblocks may cross record boundaries. If an entire subblock cannot fit into one record, it will be split and a new record will be allocated for the remainder of the subblock. Unused portions of records and records containing no data will be zero filled.

The Observation Unit for the Eight Day SST Observation File is of variable length, ranging from a minimum of four 4-byte words to a maximum of 24 words. The length must be an even number of full words with no odd full word (except the first word which is always negative). The first three words of an Observation Unit contain identification information including the type of algorithm used, the satellite, date, time, and location. The fourth word contains the actual SST data and the reliability assigned to the observation. The remainder of the Observation Unit is unique to the type of algorithm used. The format of the Eight Day SST Observation Unit is contained in Table 9.1.2-3. Tables' 9.1.2-4 and 9.1.2-5 contain the SST Observation types and source codes, respectively.

**Table 9.1.2-3. Format of the Eight Day SST Observation Unit.**

<b>Halfword#</b>	<b>Byte #</b>	<b>Contents</b>	<b>Range</b>
1	1	Type of Observation (Table 9.1.2-4)	129 to 255
1	2	Source of Observation (Table 9.1.2-5)	0 to 255
2	3	Year	0 to 99
2	4	Month	1 to 12
3	5-6	Latitude (+N,-S) x 100	-9000 to 9000
4	7-8	Longitude (+E,-W) x 100	-18000 to 17999
5	9	Day	1 to 31
5	10	Hour	0 to 23
6	11	Minute	0 to 59
6	12	Second	0 to 59
7	13-14	SST (degrees C x 10)	-20 to 350
8	15-16	Reliability	0 to 32,767
9	17-18	Solar zenith angle (degrees x 10)	0 to 1800
10	19-20	Satellite zenith angle (degrees x 10)	-600 to 600
11	21-22	Analyzed Field SST (degrees C x 10)	-20 to 350
12	23-24	Internal Error (RMS x 100)	0 to 1000
13	25-26	Solar azimuth angle (degrees x 10)	0 to 1800
14	27-28	Climatological SST (degrees C x 10)	-20 to 350
15	29	Beginning Row if unit array	1 to 11
15	30	Beginning Column of unit array	1 to 11
16	31-32	AVHRR Ch. 1 average (% x 100)	0 to 10,000
17	33-34	AVHRR Ch. 2 average (% x 100)	0 to 10,000
18	35-36	AVHRR Ch. 3 average (K x 100)	0 to 32,767

19	37-38	AVHRR Ch. 4 average (K x 100)	0 to 32,767
20	39-40	AVHRR Ch. 5 average (K x 100)	0 to 32,767
21	41-42	Space View sigma Ch. 1 (% x 100)	0 to 10,000
22	43-44	Space View sigma Ch. 2 (% x 100)	0 to 10,000
23	45-46	Space View sigma Ch. 3 (K x 100)	0 to 32,767
24	47-48	Ch. 4 Blackbody temperature (K x 100)	0 to 32,767
25	49-50	Ch. 5 Blackbody temperature (K x 100)	0 to 32,767
26	51-52	Algorithm number	1 to 32767
27	53-56	Spares	n/a

### 9.1.3 SST MONTHLY MEAN ARCHIVE

The SST Monthly Mean Archive contains twelve monthly mean SST fields for one year. NESDIS creates this archive cartridge in January of every year, archiving the monthly mean fields for the previous year. The data on this cartridge were derived exclusively from satellite data. The field has a 2.5 degree latitude-longitude resolution or 250-km resolution. For each 2.5 degree box in the field, there is a count of the number of observations in the box, the mean SST, and the standard deviation about the mean,  $\sigma$ .

The SST Monthly Mean archive cartridge contains two files. The first file is a Header File (previously described in Table 9.1-1) which contains information about the data on cartridge. The second file has 72 physical records, each containing 12 logical records consisting of satellite SST monthly mean data. For each month of the year and for each point of its geographical grid, the data consists of 1) the month's mean temperature, T; 2) the standard deviation of a single measure,  $\sigma$  sub T; and 3) the number of observations entering into the mean, N. Each of

these quantities is stored as 2-byte integers: T as degrees C x 10,  $\sigma_T$  as degrees C x 100, and N as itself.

The geographical grid establishes a global field of boxes at 2.5 degree resolution. Boxes are bordered by meridians and parallels which are multiples of 2.5 degrees in latitude and longitude. Four of these boxes can be combined to produce boxes centered on intersections of meridians and parallels which are multiples of 5 degrees in latitude and longitude.

The second file contains 12 fields, the first is January, and the last is December. Each field has 72 logical records grouped into 12 logical records per physical record or each field has 6 physical records. Each logical record is 876 bytes long with 10,512 bytes in a physical record. The first logical record in each field contains data for the 2.5 degree latitude band with southern boundary at 90.0S. The 72nd logical record for a field has data for the 2.5 degree latitude band with southern boundary at 87.5N. Within a latitude band, the first grid box has a westernmost boundary of 180W. The 144th grid box has a westernmost boundary of 177.5E. Each grid box requires three 16-bit halfwords. In addition, the first 12 bytes of each logical record contains the year, month, and latitude of the latitude band. A detailed format description of a Monthly Mean Data Field is contained in Table 9.1.3-1.

<b>Table 9.1.3-1. Format of Monthly Mean Data Field.</b>		
<b>Logical Record #</b>	<b>Bytes</b>	<b>Content (Integer values indicated)</b>
1	1-4	Year of data (e.g., 1978)
1	5-8	Month of data (e.g., 1)
1	9-12	Latitude of southern edge of this 2.5 degree latitude band (real value)
1	13-14	Number of observations N for 2.5 degree box with southwest corner at 90.0S, 180W.
1	15-16	Monthly mean temperature T (degrees C x 10) for same box
1	17-18	$\sigma_T$ (degrees C x 100) for same box
1	19-20	N for 2.5 degree box with southwest corner at 90.0S, 177.5W.
1	21-22	T for same box
1	23-24	$\sigma_T$ for same box
...	...	...
1	871-872	N for 2.5 degree box with southwest corner at 90.0S, 177.5E.

1	873-874	T for same box
1	875-876	$\sigma_T$ for same box
...	...	...
72	10,507-10,508	N for 2.5 degree box with southwest corner at 87.5N, 177.5E.
72	10,509-10,510	T for same box.
72	10,511-10,512	$\sigma_T$ for same box.

## 9.2 MAPPED GAC PRODUCTS

The Mapped GAC products consist of mapped mosaics displayed on polar stereographic and Mercator map projections with both forms available on digital media. The Mapped mosaics consist of daytime visible (VIS) and Infrared (IR), and nighttime IR imagery. The Mapped GAC product in polar stereographic form is described in Section 9.2.1, while the Mapped GAC product in Mercator form is described in Section 9.2.2. For a representative sample of Mapped GAC products, users should link to

URL: <http://www.osdpd.noaa.gov/PSB/IMAGES/mapped.html> .

NESDIS/IPD also produces an operational mapped GAC product which is known as the Global Vegetation Index Product. This product provides a means of monitoring the density and vigor of green vegetation over the growing areas of the Earth. Plate Carreé, polar stereographic and Mercator mosaics of the Global Vegetation Index, derived from AVHRR Channels 1, 2, plus coincident channels 4 and 5, and supporting information are produced weekly. For more information, see the *NOAA Global Vegetation Index User's Guide*, which is available from NCDC. For the latest maps of the various Global Vegetation Index Products, link to URL: <http://www.osdpd.noaa.gov/PSB/IMAGES/gvi.html>.

### 9.2.1 MAPPED GAC (POLAR STEREOGRAPHIC) PRODUCT

The Mapped GAC (polar stereographic) data are organized as daytime and nighttime for the northern and southern hemispheres. The daytime data contain both visible (Channel 1) and IR (Channel 4) data while the nighttime data contain only the IR data. The data are reported in pairs of files. The first file of each file pair consists of a documentation record for that variable, immediately followed by an EOF and a second file containing the data records for the same variable. All records are 16,384 bytes in length. Both documentation and data records are in binary format and have the same length. A value of zero indicates missing data.

Every day a 3480 cartridge is created which contains one day of data in the polar stereographic projection. Table 9.2.1-1 contains the general file structure of this daily KLM Master map file. Each cartridge contains 12 files arranged as shown in Table 9.2.1-1.

The variables reported in the documentation record are all INTEGER\*2 with the exception of the satellite type in the first two bytes of the record, which is CHARACTER\*2. Table 9.2.1-2 defines the basic documentation record format.

Each data record (16,384 bytes) consists of four mapped rows, each containing 4096 pixels of data. Each pixel is represented by one byte of data.

<b>Table 9.2.1-1. General structure of the polar stereographic KLM Master Map File.</b>	
<b>File, record #</b>	<b>Contents</b>
<b>DAYTIME NORTHERN HEMISPHERE</b>	
<b>Visible Channels</b>	
F1, rec. 1	Channel 1 documentation record. See Table 9.2.1-2 for format
F2, rec. 1-1024	Channel 1 data records. Consists of 16,384 bytes of data or 4 mapped rows of data. Each row contains 4096 pixels of data. Each pixel is one byte. A value of 0 indicates missing data
<b>IR Channels</b>	
F3, rec. 1	Channel 4 documentation record. See Table 9.2.1-2 for format
F4, rec. 1-1024	Channel 4 data records. Same as F2 data records
<b>DAYTIME SOUTHERN HEMISPHERE</b>	
<b>Visible Channels</b>	
F5, rec. 1	Channel 1 documentation record. See Table 9.2.1-2 for format.
F6, rec. 1-1024	Channel 1 data records. Same as F2 data records
<b>IR Channels</b>	
F7, rec. 1	Channel 4 documentation record. See Table 9.2.1-2 for format.
F8, rec. 1-1024	Channel 4 data records. Same as F2 data records.
<b>NIGHTTIME NORTHERN HEMISPHERE</b>	

	<b>IR Channels</b>
F9, rec. 1	Channel 4 documentation record. See Table 9.2.1-2 for format.
F10, rec. 1-1024	Channel 4 data records. Same as F2 data records
<b>NIGHTTIME SOUTHERN HEMISPHERE</b>	
	<b>IR Channels</b>
F11, rec. 1	Channel 4 documentation record. See Table 9.2.1-2 for format.
F12, rec. 1-1024	Channel 4 data records. Same as F2 data records.

<b>Table 9.2.1-2. Format of documentation record for polar stereographic KLM Master Map data.</b>	
Byte #s	Contents
1-2	Satellite type, e.g., NH=NOAA-H (CHARACTER*2)
3-4	Satellite ID: 0=morning satellite; 1=afternoon sat.
5-6	Data set type: 1=LAC; 2=GAC; 3=HRPT
7-8	Projection type: 0=unmapped; 1=Mercator; 2=Polar; 3=linear lat/lon
<b>IMAGE BOUNDARIES</b>	
9-10	Beginning latitude x 128; North>0; South<0
11-12	Ending latitude x 128
13-14	Beginning longitude x 128; East>0; West<0
15-16	Ending longitude x 128
17-18	Mapped resolution x 100; km for polar and mercator projections; degree/pixel for linear lat/lon projections; sampling interval for unmapped projection
19-22	Spares
<b>POLAR PROJECTION DATA</b>	
23-24	Polar grid mesh size (grid size that corresponds to resolution, e.g., 64 = 1/64 grid)
25-26	Number of grid points (that correspond to grid size, e.g., 1/64 grid corresponds to 4096 points)

27-28	Hemisphere: 1=Northern; -1=Southern
29-30	Prime longitude; East>0; West<0
	<b>GRID OFFSETS</b>
31-32	IOFF; grid coordinates of top left corner of the image. (not applicable for unmapped projections)
33-34	JOFF
	<b>IMAGE SIZE</b>
35-36	Number of rows
37-38	Number of columns
39-42	Spares
43-44	Composite flag: 0=no composite; 1=composite based on minimum nadir angle; 2=retain average value; 3=retain later value; 4=retain warmer value; 5=retain colder value
45-46	Calibration flag: 0=raw counts; 1=radiances; 2= calibrated to albedos and BTs; 3=calibrated to albedos and GOES counts
47-48	Fill-up options: 0=no fill-up; 1=fill-up using averages; 2=fill-up using adjacent pixel values
49-50	Channel number: 1-5=channel number; 101=scan angle; 102 =satellite zenith angle; 103=solar zenith angle; 104 = relative azimuth angle; 105=scan time; 201=SST split window; 202=SST dual window; 203=SST Triple window
51-52	Data ID: 0=visible; 1=infrared; 2=ancillary
	<b>DATA CORRECTION FLAGS</b>
53-54	Sun normalization: 0=not performed; 1=performed
55-56	Limb correction: 0=not performed; 1=performed
57-58	Nonlinearity correction: 0=not performed; 1=performed
59-60	Number of orbits processed
	<b>CHANNEL IMAGES</b>
61-62	Number of channels produced

63-64	Pixel size: 1=1 byte; 2=2 bytes
65-66	Starting block number
67-68	Ending block number
	<b>ANCILLARY DATA</b>
69-70	Number of ancillary parameters produced
71-72	Pixel size: 1=1 byte; 2=2 bytes
73-74	Starting block number
75-76	Ending block number
77-78	Block size of image files
79-80	Compression flag
81-100	Spares
	<b>ORBIT 1 INFORMATION</b>
101-102	Orbital node over region: -1=asc; 1=desc; 2=both
103-104	Day/night flag: 0=day; 1=night
	<b>IMAGE DATA BOUNDARIES</b>
105-106	Start row
107-108	Start column
109-110	End row
111-112	End column
	<b>ORBIT START TIME</b>
113-114	Year of century
115-116	Day of year
117-118	Month and day of month (month x 100) + day
119-120	Hours and minutes (hours x 100) + minutes
121-122	Seconds

123-124	Milliseconds
	<b>ORBIT END TIME</b>
125-126	Year of century
127-128	Day of year
129-130	Month and day of month (month x 100) + day
131-132	Hours and minutes (hours x 100) + minutes
133-134	Seconds
135-136	Milliseconds
137-138	Processing block ID (orbit number)
	<b>QUALITY FLAGS</b>
139-140	Ramp/auto calibration flag
141-142	Number of data gaps
143-144	Sync errors
145-146	TIP parity errors
147-148	Auxiliary errors
149-150	Calibration parameter ID
151-152	DACS status
	<b>CALIBRATION COEFFICIENTS</b>
153-154	Channel 1 slope x 10,000
155-156	Channel 1 intercept x 1,000
157-158	Channel 2 slope x 10,000
159-160	Channel 2 intercept x 1,000
161-166	Spares
	<b>ORBIT 2 INFORMATION</b>
167-232	Same as bytes 102-166

	<b>ORBIT 3 INFORMATION</b>
233-298	Same as bytes 102-166
...	...
	<b>ORBIT n INFORMATION</b>
((n-1) x 66+102) -((n-1)x 66+166)	Same as bytes 102-166

### 9.2.2 MAPPED GAC (MERCATOR) PRODUCT

The Mapped GAC (Mercator) data are organized as visible (Channel 1), and daytime and nighttime IR (Channel 4). These data are reported in pairs of files, totaling six files. The first file of each file pair consists of a documentation record for that variable, immediately followed by an EOF and a second file containing the data records for the same variable. All records are 4,052 bytes in length. Both documentation and data records are in binary format and have the same length. A value of zero indicates missing data.

Every day a 3480 cartridge is created which contains a day's worth of Mapped GAC data in the mercator projection. Table 9.2.2-1 contains the general file structure of the daily mercator KLM Master Map file. Each file contains 6 files arranged as shown in the table.

The format of the basic documentation record is the same as the polar stereographic KLM Master Map which is contained in Table 9.2.1-2.

Each data record (4,052 bytes) consists of one mapped row, containing 4052 pixels of data. Each pixel is represented by one byte of data.

<b>Table 9.2.2-1. General structure of the Mercator KLM Master Map File.</b>	
<b>File, record #</b>	<b>Contents</b>
	<b>Visible Channels</b>
F1, rec. 1	Channel 1 documentation record. See Table 9.2.1-2 for format.
F2, rec. 1-984	Channel 1 data records. Consists of 4,052 bytes of data or 1 mapped row of data. Each row contains 4052 pixels of data. Each pixel is one byte. A value of 0 indicates missing data.
	<b>IR Channels (Daytime)</b>

F3, rec. 1	Channel 4 documentation record. See Table 9.2.1-2 for format.
F4, rec. 1-984	Channel 4 data records. Same as F2 data records
	<b>IR Channels (Nighttime)</b>
F5, rec. 1	Channel 4 documentation record. See Table 9.2.1-2 for format
F6, rec. 1-984	Channel 4 data records. Same as F2 data records.

### 9.3 RADIATION BUDGET PRODUCTS

After the launch of NOAA-K, NOAA will be generating all the radiation budget products in the new NOAA KLM one degree equal area format. In addition, the older TIROS-N format for radiation budget products will be available through May 1999. This section contains a description of the NOAA KLM radiation budget products as well as a brief overview of the TIROS-N series products.

#### 9.3.1 NOAA KLM RADIATION BUDGET PRODUCTS

The Radiation Budget Product Generation System (RBP GS) generates four basic output files: the Primary Components File for daily products (Section 9.3.1.1), the Monthly Mean files (Section 9.3.1.2), the Seasonal Mean files (Section 9.3.1.3) and the Annual Mean files (also in Section 9.3.1.3).

##### 9.3.1.1 Primary Components 37 Day File (PC37DF)

This is the basic output file generated by the RBP GS and is known as the Primary Components 37 Day File (PC37DF). It is a revolving file with, at present, one record for a header plus a set of records for each of 37 day bins. The Primary Components File has a logical record size of 23,476 bytes with one record per block. The file format is ASCII for text information and integer (I\*2) for the data. Each day bin contains three sets of maps:

1. Nighttime (22 maps),
2. Daylight longwave (22 maps),
3. Daylight shortwave (24 maps).

Each set of maps occurs in pairs, one map for the Northern Hemisphere and one for the Southern Hemisphere (thus the nighttime maps consist of eleven types). Each of these requires two records. The structure of an individual map is based on the Pathfinder Equal Areas/Equal Aspect (EAA) map. The whole RBP GS is set up to, at any time, either add or subtract data from any day bin within the PC37DF. This is done so as to allow reprocessing of poor data. The file is fully

described in Table 9.3.1.1-1. Note, the tabulated Available Solar Energy (ASE) Day Bin Fields are stored contiguously (all 600) in the header and are allocated to each Day Bin.

<b>Table 9.3.1.1-1. Description of the Primary Components 37 Day File (PC37DF) Header.</b>			
<b>Field</b>	<b>Bytes</b>	<b>Type</b>	<b>Description</b>
HEADER	1-100	A100	ASCII Header “NOAA/NESDIS RADIATION BUDGET ARCHIVED 37-DAY PRIMARY COMPONENTS FILE PRD.RADBUD.NOAAXX.ARC.DAY37CMP” where XX indicates the satellite used.
TYPE	101-102	I*2	The type of file (0 for Primary components file).
VER	103-104	I*2	The version number of the file (0 for this version).
SATID	105-106	I*2	The satellite ID.
PCOY	107-108	I*2	The year of the oldest data contained in the file.
PCOM	109-110	I*2	The month of the oldest data contained in the file.
PCOD	111-112	I*2	The day of the month of the oldest data contained in the file.
PCYY	113-114	I*2	The 4 digit year of the youngest (most current) data in the file.
PCYM	115-116	I*2	The month of the youngest (most current) data in the file.
PCYD	117-118	I*2	The day of the month of the youngest (most current) data in the file.
PCDBO	119-120	I*2	The day bin reflecting the oldest data in the file.
PCDBY	121-122	I*2	The day bin reflecting the youngest (most current) data in the file.
PCDBSR	123-124	I*2	The first physical record on this file that contains Primary Components map data for day bin number 1.
PCDBBL	125-126	I*2	The total number of physical records in this file that are required by each day bin.
IDATE	127-132	3 I*2	The creation date of this file (YYYYMMDD).

RECTYP	133-134	I*2	The record type of this (header) record (=1).
EPOCHY	135-136	I*2	The satellite epoch year (launch year).
EPOCHD	137-138	I*2	The satellite epoch day-in-year (launch day).
MAPTYP	139-140	I*2	The map type (0=PSG maps, 1=EAA maps).
ASPECT	141-142	I*2	EAA map aspect ratio x 1000.
AREA	143-144	I*2	EAA map nominal element area (square degrees x 1000).
CSCALE	145-148	I*4	Polar Stereographic (PSG) map scale (grid points x 1000 between pole and equator).
LRC	149-150	I*2	Longitude Rotation Convention (LRC).
PRIMEL	151-152	I*2	PSG map Prime Longitude x 100 (interpreted via the LRC).
PACK	153-154	I*2	Is the map to be packed? If yes, then PACK=1. Note that EAA maps are packed.
NPROWS	155-156	I*2	If so, then number of rows per stored column.
SBOUND (1-5)	157-166	5I*2	GAC 5 shortwave class boundary fluxes for the GAC histograms. These values have to be the same as those held in SF/RF 18 and in the RDAF header (the sixth value is immaterial).
LBOUND (1-5)	167-176	5I*2	GAC 5 longwave class boundary fluxes for the GAC histograms. These values have to be the same as those held in SF/RF 18 and in the RDAF header (the sixth value is immaterial).
TSTAMP	177-188	6I*2	Time stamp written at the end of ANLRET/SUMFRM as YYYYMMDDHHMMSS.
NDHELD	189-190	I*2	Number of days in the 37(!) Day files. This is to be the same as RADANL: DBNX.
PRL	191-194	I*4	Primary Components 37 Day File physical record length (23,476 bytes for this version).
	195-276		Spare.

<b>Tabulated ASE Day Bin Fields</b>			
ABDN	277+ (ABDN-1)*600:2 78+ (ABDN-1)*600	I*2	Permanent Day Bin label. Values 1 to 37 (or RADANL: DBNX the number of day bins in the 37(!) day files).
NCDAY	279+ (ABDN-1)*600:2 80+ (ABDN-1)*600	I*2	Actual Day Number of the contained data relative to the Satellite Epoch.
NARUNS	281+ (ABDN-1)*600:2 82+ (ABDN-1)*600	I*2	Number of RADRET runs involved in the ASETAB average.
IDATIM (1-6)	283+ (ABDN-1)*600:2 94+ (ABDN-1)*600	6 I*2	Time Stamp YYMMDDHHMMSS
ASETAB (1-91)	295+ (ABDN-1)*600:4 76+ (ABDN-1)*600		Contains the Biased Sum of Average Available Solar Energy (ASE) Table for the actual day currently occupying the day bin. There are 91 values (two bytes each) in each field starting at the North Pole and then given at intervals of two degrees. Each value should be divided by the number of pixels in a target (currently 121). Then add the shortwave bias value (currently 270) to retrieve the average unbiased ASE value for each latitude.

	477+ (ADBN-1)*600:8 76+ (ADBN-1)*600		Spare.
	22077- 23476		Spare.

The first map data containing record on the Primary Components file is the first data record of Day Bin 1 and is Record Number PCDBSR (see Table 9.3.1.1-1). If PCDBSR is set higher than 2, then an extended header may be constructed running from record 2 to PCDBSR-1.

Day Bin 1 runs from Record PCDBSR through Record PCDBBL + PCDBSR - 1 , i.e., there are PCDBBL records allocated to day bin 1 and, thereafter, to every day bin. The records in each day bin are constructed in exactly the same manner with the only difference being the Permanent Day Bin label, DBN, located in bytes one and two of each record, allocated to the given day bin. Day Bin 2, etc. is structured exactly the same as Day Bin 1 (apart from the value of DBN) and immediately follows Day Bin 1.

In a Day Bin, the records occur in groups of four, all pertaining to the same kind of map field (e.g., GAC OLR at night); two records for the Northern Hemisphere followed directly by two records for the Southern Hemisphere. The format of the first record of a hemisphere pair is described in Table 9.3.1.1-2, while the second record of a hemisphere pair is contained in Table 9.3.1.1-3.

<b>Table 9.3.1.1-2. Format of Record 1 of a Hemisphere Pair in a Day Bin.</b>			
<b>Field</b>	<b>Bytes</b>	<b>Type</b>	<b>Description</b>
DBN	1-2	I*2	Permanent Day Bin label.
BCDAY	3-4	I*2	Actual Day Number, relative to the Satellite Epoch, of the data that is currently stored in the day bin.
YEAR	5-6	I*2	Actual four digit year.
MONTH	7-8	I*2	Actual month.
DAY	9-10	I*2	Actual day of month.

PURGET	11-12	I*2	Last purge date (=100 x month + day, with month and day being the real-time month and day of the first writing of the BCDAY data).
RCTYPE	13-14	I*2	'02' 1st record of a Northern Hemisphere map. '04' 1st record of a Southern Hemisphere map.
DBSECN	15-16	I*2	Day Bin Section Number: 1= Night; 2= Longwave Day; 3= Shortwave Day.
FIELD	17-18	I*2	Field mnemonic. (See Table 9.3.1.1-4).
NORS	19-20	I*2	Hemisphere: North=0, South=1.
TSTAMP	21-32	6 I*2	Time Stamp as 'YYYYMMDDHHMMSS' of most recent data addition or subtraction.
NARUNS	33-34	I*2	Showing the number of RADRET runs contributing to the tabulated Available Solar Energy (ASE). Copied from the PC37DF header.
ASEBYT	35-216		Showing the Biased Sum of Tabulated ASE for the (1-91) actual day, starting at the North Pole and then given for every two degrees latitude. Copied from the PC37DF header.
SPARE	217-276		Spare
I*2MAP	277-23,476		Showing the first 11,600 I*2 elements of the Equal Areas/Equal Aspect Pathfinder Map (of total size 20,626 elements) for the hemisphere. The first set of elements (3) is for the pole. The second latitude band of elements (9) is for -89 in the Southern Hemisphere and 89 for the Northern Hemisphere. This continues toward the equator, where the number of elements in each latitude band is determined by the array NCELL (see second hemisphere pair). The first element in a latitude set is the eastward most longitude (beginning at the Greenwich Meridian). Each element after that is west of the previous element in the latitude set.

<b>Table 9.3.1.1-3. Format of Record 2 of a Hemisphere Pair of a Day Bin.</b>			
<b>Field</b>	<b>Bytes</b>	<b>Type</b>	<b>Description</b>
DBN	1-2	I*2	Permanent Day Bin label.
FIELD	3-4	I*2	Field mnemonic (see Table 9.3.1.1-4).
NORS	5-6	I*2	Hemisphere: North=0; South=1.
NCELL (1-90)	7-186	90 I*2	Each succeeding value represents the number of longitude bins in each of 90 latitude bands of the (current) Equal Areas/Equal Aspect Pathfinder Maps starting at the pole and abutting (to the west) the Greenwich Meridian.
I2MAP	277-18,328		Showing the remaining 9,026 elements (11,601-20,626) of the EAA map stored as 20,626 I*2 integers.
	18,329-22,036		Spare
E2MAP	22,037-23,476		Showing the 720 I*2 elements of the equatorial band data for the hemisphere. Each element is for use with the old-style 144 by 72 LatLon maps, and is of size 1.25 degrees in latitude and 0.5 degrees in longitude with each element abutting the equator and the first element centered on the dateline. Subsequent elements are recorded eastwards.

<b>Table 9.3.1.1-4. Field Mnemonic for radiation budget monthly mean data.</b>

### 9.3.1.2 Monthly Mean Radiation Budget Product

This file contains one month of current monthly mean data. It contains 25 records. The first record is the header. It contains six types of data: HIRS Night OLR, HIRS Day OLR, AVHRR Night OLR, AVHRR Day OLR, Available Solar Energy, and AVHRR SW Absorbed Radiation. Each type of data is associated with four records (The Northern Hemisphere pair and the Southern Hemisphere pair).

The format of the header record for the Monthly Means (and also the Seasonal and Annual Means) data is shown in Table 9.3.1.2-1.

<b>Table 9.3.1.2-1. Format of Header Record for Monthly/Seasonal/Annual Mean Data.</b>			
<b>Field</b>	<b>Bytes</b>	<b>Type</b>	<b>Description</b>
HEADER	1-100	ASCII	Text header
SATID	101-102	I*2	The satellite ID
RPTREQ	103-104	I*2	The type of mean: 0=Monthly; 1=Winter; 2=Spring; 3=Summer; 4=Fall; 5=Annual.
RPTYR	105-106	I*2	The four digit year of the initial data.
RPTMO	107-108	I*2	The month of the initial data.
VER	109-110	I*2	Version number of this file format.
RPTOY	111-112	I*2	The four digit year of the latest data contained in the file.

RPTOM	113-114	I*2	The month of the latest data contained in the file.
RPTOD	115-116	I*2	The day of the month of the latest data contained in the file.
SPARES	117-122	I*2	SPARES
MAXCNT	123-124	I*2	The number of records in the file.
SPARE	125- 126	I*2	SPARE
EPOCHY	127-128	I*2	The four digit satellite epoch year (launch year).
EPOCHD	129-130	I*2	The satellite epoch day-in-year (launch day).
EPOCHT	131-132	I*2	The time of day of the satellite launch: 1=morning 2=afternoon.
TYPREC	133-134	I*2	The record type of this (header) record (=1).
NUMTYP	135-136	I*2	The number of data types in the file. The maximum number of data types is 35. The current number supported is 6.
NUMRECS	137-138	I*2	The number of records per data type is 4.
TYPENAM	139-208	32 I*2	The names of the number of data types currently supported in the file. There is one name for each of the NUMTYP supported. 2=HN, 3=GLN, 13=HD, 15=GLD, 24=AS, 26=GS (See Note 1)
SPARES	209-6447	I*2	The spare bytes in the header record.

Tables' 9.3.1.2-2 and 9.3.1.2-3 contain the format for Records 1 and 2 of the Monthly Mean Data, respectively.

<b>Table 9.3.1.2-2. Format of Monthly Mean Data Record 1 of a Hemisphere Pair.</b>			
<b>Field</b>	<b>Bytes</b>	<b>Type</b>	<b>Description</b>
SPARE	1-2	I*2	SPARE

BCDDAY	3-4	I*2	The actual day number, relative to the satellite Epoch, of the first day in the period covered in the file. (i.e. for monthly means the day is relative to the first day of the month)
SPARES	5-12	I*2	SPARES
RCTYPE1	13-14	I*2	The indicator for the first record of the hemisphere: 02 = Record 1 for the Northern Hemisphere; 04 = Record 1 for the Southern Hemisphere.
SPARE	15-16	I*2	SPARE
FIELD	17-18	I*2	The Field mnemonic. (See Table 9.3.1.1-4)
NORS	19-20	I*2	The hemisphere indicator: 0= North; 1= South
BEGINDATE	21-24	2 I*2	The start time as YYYYMM of the data in the record.
SPARE	25-26	I*2	SPARE
ENDDATEF	27-30	2I*2	The end time as YYYYMM of the data in the record.
SPARES	31-276	I*2	SPARES
I2MAP	277-23476	I*2	The mean values of the first 11600 I*2 elements of the 20626 elements of the Equal Areas/Equal Aspect Map

**Table 9.3.1.2-3. Format of Monthly Mean Data Record 2 of a Hemisphere Pair..**

<b>Field</b>	<b>Bytes</b>	<b>Type</b>	<b>Description</b>
RECTYP2	1-2	I*2	The indicator for the second record of the hemisphere: 03=Record 2 for the Northern Hemisphere; 05=Record 2 for the Southern Hemisphere.
FIELD	3-4	I*2	The Field mnemonic. (See Note 1)

NORS	5-6	I*2	The hemisphere indicator: 0=North; 1= South.
NCELL	7-186	90 I*2	The number of longitude bins in each of 90 latitude bands of the (current) Equal Areas/Equal Aspect Pathfinder Maps starting at the pole and abutting (to the west) the Greenwich Meridian.
SPARES	187-276	I*2	SPARES
I2MAP	277- 18328	I*2	The mean values of the last 9026 I*2 elements of the 20,626 elements of the Equal Areas/Equal Aspect Map
SPARE	18329-22036	I*2	SPARE
E2MAP	22037-23476	I*2	The 720 I*2 mean elements of the equatorial band data for the hemisphere

### 9.3.1.3 Seasonal/Annual Mean Radiation Budget Product

This file contains one season or one year of mean radiation budget data. It contains 25 records. The first record is the header. It contains six types of data: HIRS Night OLR, HIRS Day OLR, AVHRR Night OLR, AVHRR Day OLR, Available Solar Energy, and AVHRR SW Absorbed Radiation. Each type of data is associated with four records (the Northern Hemisphere pair and the Southern Hemisphere pair). The format of the header record has already been described in Table 9.3.1.2-1. The first data record of a hemisphere pair is described in Table 9.3.1.3-1, while data record 2 of a hemisphere pair is shown in Table 9.3.1.3-2.

<b>Table 9.3.1.3-1. Format of Seasonal/Annual Mean Data Record 1 of a Hemisphere Pair.</b>			
<b>Field</b>	<b>Bytes</b>	<b>Type</b>	<b>Description</b>
SPARE	1-2	I*2	SPARE
BCDDAY	3-4	I*2	The actual day number, relative to the satellite Epoch, of the first day in the period covered in file 1 (i.e. for monthly means the day is the relative to the first day of the month).
SPARES	5-12	I*2	SPARES

RCTYPE1	13-14	I*2	The indicator for the first record of the hemisphere: 02 = Record 1 for the Northern Hemisphere; 04 = Record 1 for the Southern Hemisphere.
SPARE	15-16	I*2	SPARE
FIELD	17-18	I*2	The Field mnemonic. (See Table 9.3.1.1-4).
NORS	19-20	I*2	The hemisphere indicator: 0= North; 1= South.
BEGINDATE	21-24	2 I*2	The start time as YYYYMM of the data in the record.
SPARE	25-26	I*2	SPARE
ENDDATEF	27-30	2 I*2	The end time as YYYYMM of the data in the record.
SPARES	31-276	I*2	SPARES
I2MAP	277- 23,476	I*2	The mean values of the first 11,600 I*2 elements of the 20,626 elements of the Equal Areas/Equal Aspect Map

**Table 9.3.1.3-2. Format of Seasonal/Annual Mean Data Record 2 of a Hemisphere Pair.**

Field	Bytes	Type	Description
RECTYP2	1-2	I*2	The indicator for the second record of the hemisphere: 03=Record 2 for the Northern Hemisphere; 05=Record 2 for the Southern Hemisphere.
FIELD	3-4	I*2	The Field mnemonic. (See Table 9.3.1.1-4).
NORS	5-6	I*2	The hemisphere indicator: 0= North; 1= South.

NCELL	7-186	90I*2	The number of longitude bins in each of 90 latitude bands of the (current) Equal Areas/Equal Aspect Pathfinder Maps starting at the pole and abutting (to the west) the Greenwich Meridian.
SPARES	187-276	I*2	SPARES
I2MAP	277-18,328	I*2	The mean values of the last 9026 I*2 elements of the 20626 elements of the Equal Areas/Equal Aspect Map
SPARE	18,329-22,036	I*2	SPARE
E2MAP	22,037-23,476	I*2	The 720 I*2 mean elements of the equatorial band data for the hemisphere

### 9.3.2 TIROS-N SERIES RADIATION BUDGET PRODUCTS

There are six types of digital Radiation Budget products archived by NOAA/NCDC. All radiation budget products are produced by the NOAA/NESDIS Office of Satellite Data Processing and Distribution's Product Systems Branch (OSDPD/PSB). The six types of Radiation Budget products are: 37 Day file, monthly radiation, seasonal radiation, monthly mean radiation, seasonal mean radiation and annual mean radiation budget products. These are described in the *NOAA Polar Orbiter Data Users Guide*, Section 5.4, which is available online at: <http://www.ncdc.noaa.gov/oa/pod-guide/ncdc/docs/podug/html/c5/sec5-4.htm>. There are seven months of these TIROS-N style products archived for NOAA-K (November 1998 through April 1999) which are available concurrently with the NOAA KLM style products for comparison/continuity purposes.

### 9.4 SOUNDING PRODUCTS (ATOVS AND AMSU-B)

Beginning with the NOAA-15 satellite, the sounding instrument suite was dramatically changed. The four-channel MSU instrument was replaced with a 20-channel AMSU instrument suite, AMSU-A for temperature and AMSU-B for moisture. The SSU instrument was dropped but AMSU-A essentially replaces its function. The HIRS, AMSU-A and AMSU-B instruments are described in Sections 3.2, 3.3 and 3.4, respectively. The ATOVS system is the 'TOVS' system for NOAA-15 and subsequent satellites. ATOVS uses the HIRS and AMSU-A to generate the retrieved profiles. The AVHRR instrument is used for cloud detection along with the HIRS and AMSU-A. The AMSU-B instrument is currently not part of the ATOVS system, primarily because of resource limitations in the development of the system. Therefore, the AMSU-B is processed independently of ATOVS using a slightly modified version of software developed and used to process the SSM/T-2 on the DMSP satellites. The AMSU-B system became operational

about one year after ATOVS because of satellite antenna interference in the AMSU-B data. NESDIS has expended a great deal of effort to reduce the interference and accurately account for the constant interference which remains. Refer to Appendix M for more details about the AMSU-B Bias Correction Algorithm.

NESDIS currently has the capability of producing a maximum of 370,000 soundings every 24 hours from two operational spacecraft. ATOVS from NOAA-15 generates about 300,000 retrievals every 24 hours with a 60 km resolution (40 km at nadir). AMSU-B from NOAA-15 generates about 1,400,000 moisture retrievals every 24 hours with a 15 km resolution and 15 km spacing between retrievals; the data are sampled to reduce the data volume by half. Section 9.4.1 describes the ATOVS format, while Section 9.4.2 describes the AMSU-B format.

#### 9.4.1 ATOVS SOUNDING PRODUCT (APRIL 27, 1999 - PRESENT)

The ATOVS archive (NOAA KLM series) is substantially different from the TOVS archive (TIROS-N, NOAA-6 through NOAA-14 series). Users that need a description of the format used for the TOVS Sounding Product between January 1979 and March 8, 1992, should refer to Section 5.1 of the *NOAA Polar Orbiter Data User's Guide*. ATOVS retrievals are made at 40 km spacing at nadir and up to 80 km at the limb. The ATOVS archive is actually four separate archive products. The first is the retrieval archive which is the full resolution archive of the ATOVS products, processed orbitally. The second archive is the metadata archive which consists of weekly statistics comparing the ATOVS retrievals to radiosonde data. The third archive is the Radiosonde Match Archive which contains radiosonde and retrieval data collocated in time and space. The final ATOVS archive product is the coefficient data base (CDB). The CDB contains the primary coefficients used in the generation of the ATOVS retrievals. Some coefficients are constants, others are satellite dependent and another set is updated on a weekly basis. The CDB is a very complex file and is not described in this section. Documentation about the CDB will be provided with any CDB product requested.

##### 9.4.1.1 ATOVS Sounding Retrieval Archive Data File

The ATOVS retrieval archive data file contains complete sounding data, retrieval products and data quality flags. The Retrieval Archive Data File is in all integer format with data values scaled by values such as 64 or 128. The file contains records of length 1,000 bytes with a block size of 9,000 bytes. The first record in each file is the header record which is the same size as the data records and is described in Table 9.4.1.1-1. Records 2 through N (the number of records) contain the retrieval records, in that the data frame record N+1 contains the data frame header for the next data frame. A typical orbit has 28 data frames. The format of each ATOVS retrieval data record is described in Table 9.4.1.1-2. The archive product has been filtered for super adiabatic retrievals. Even though there is a super adiabatic flag it will always return no super adiabatic data. Precipitation contaminated data is included in the archive. However it is not advisable to use this data with the same weight as the rest of the product for temperature or moisture retrieval analysis. The ATOVS archive contains parameters that were not archived in TOVS or RTOVS. These are

cloud information (cloud top pressure and temperature, cloud amount) and radiation budget information (outgoing longwave radiation, layer cooling rates), and the sulfur dioxide content. These terms should be used with caution, even though they are archived as part of the ATOVS product, they are very new products and not fully proven for accuracy. The fill value for this file is -32768, missing is typically all I\*2 bits set.

<b>Table 9.4.1.1-1. Format of header record for ATOVS retrieval data file.</b>				
<b>Starting Byte</b>	<b>I*4 Location</b>	<b>Length</b>	<b># of values</b>	<b>Description</b>
1	1	4	1	Number of data records in the file
5	2	4	1	First data record written in file (2)
9	3	4	1	Last data record written
13	4	4	1	Logical record length
17	5	4	1	Spacecraft ID
21	n/a	3	1	File type (RET)
25	n/a	8	1	Satellite name ( e.g. NOAA 15)
34	n/a	44	1	File name
79	n/a	10	1	File creation data (YYYYMMDDHH)
89	23	4	1	Beginning orbit number
93	24	4	1	Ending orbit number
97	25	4	1	Time of first retrieval (YYYYMM)
101	26	4	1	Time of first retrieval (DDHH)
105	27	4	1	Time of first retrieval (mmss)
109	28	4	1	Time of last retrieval (YYYYMM)
113	29	4	1	Time of last retrieval (DDHH)
117	30	4	1	Time of last retrieval (mmss)
121	31-67	4	37	Spares

**Table 9.4.1.1-2. Format of ATOVS Retrieval Data Record.**

<b>Byte #</b>	<b>Integer Index</b>	<b># of Values</b>	<b>Length</b>	<b>Scale</b>	<b>Description</b>
1	1	1	2	n/a	Record type (2=data record)
3	2	1	2	n/a	Satellite number (XX from "NOAA-XX")
5	3	1	2	n/a	Data frame number from beginning of Level 1b data
7	4	1	2	n/a	Beginning orbit number
9	5	1	2	n/a	Ending orbit number
11	6	5	2	n/a	Spare
21	11	1	2	n/a	Surface elevation (m)
23	12	7	2	n/a	Spare
37	19	1	2	n/a	4-digit retrieval year
39	20	2	2	n/a	Valid forecast date/time (YYMM, DDHH)
43	22	1	2	n/a	Spare
45	23	1	2	n/a	Retrieval grid point number (counter over the retrieval grid of 28 spots by 20 lines)
47	24	1	2	128	Retrieval latitude (-90 to +90 degrees)
49	25	1	2	128	Retrieval longitude (-180 to +180 degrees)
51	26	3	2	n/a	Retrieval time (YYMM, DDHH, mmss)
57	29	1	2	n/a	Precipitation flag: 0=no precipitation; 1=precipitation

59	30	1	2	n/a	Terrain flag: 0=sea; 1=land; 2=coast; 10=sea ice; 11=snow
61	31	1	2	n/a	Day/Night flag: 0=night; 1=day.
63	32	1	2	n/a	Test or production version number
65	33	1	2	n/a	Processing flag: 0=unsuccessful; 1=successfully processed
67	34	1	2	128	Solar zenith angle (degrees)
69	35	1	2	128	Satellite (local) zenith angle (degrees)
71	36	1	2	n/a	Geographical index (bin number 1-23). (See Table 9.4.1.1-3.)
73	37	1	2	128	Solar azimuth angle (degrees)
75	38	1	2	n/a	HIRS spot number (1-56)
77	39	1	2	n/a	Orbital node: 1=ascending; 2=descending
79	40	1	2	n/a	Super adiabatic flag: 0=not super adiabatic; 1=super adiabatic between 700 mb and 1000 mb; 2=super adiabatic between 500 mb and 700 mb; 3=super adiabatic between 100 mb and 500 mb; 4=super adiabatic above 100 mb

81	41	1	2	n/a	Observation quality flag: 0=good; 2=failed gross temperature limits for HIRS and AMSU-A or is polar redundant or is super adiabatic, do not use for distribution, tuning or evaluation)
83	42	1	2	n/a	Retrieval flag: 0=clear; 32=cloudy; 48=no-HIRS (one or more HIRS channel is missing or out of bounds)
85	43	1	2	n/a	Spare
87	44	1	2	n/a	Spare
89	45	42	2	64	Retrieved temperature profile (K). See note 1.
173	87	40	2	64	Adjusted brightness temperatures (limb-corrected and cloud-detection performed) (K). See note 2.
253	127	35	2	64	Bias corrected, limb-corrected, cloud-detection performed brightness temperatures (K). See note 2.
323	162	35	2	64	Non-limb corrected, cloud-detection performed brightness temps (K). See note 2.
393	197	42	2	n/a	Geopotential heights (m). See note 1.
477	239	19	2	1024	Water vapor mixing ratios, ln (g/kg). See note 3.
515	258	1	2	64	Tropopause temperature (K)
517	259	1	2	n/a	Tropopause pressure (mb)
519	260	1	2	128	Total precipitable water (mm)
521	261	15	2	128	Layer precipitable water (mm). See note 4.

551	276	15	2	64	Layer mean virtual temperature (K). See note 4.
581	291	20	2	n/a	Layer thicknesses (m). See note 5.
621	311	1	2	n/a	Spare
623	312	1	2	n/a	Spare
625	313	1	2	n/a	Spare
627	314	9	2	n/a	Spare
645	323	1	2	64	Sea surface temperature from internal map (K) (set to missing when SST map has land but terrain map has sea).
647	324	1	2	64	Derived skin temperature value (K)
649	325	1	2		Surface model level (ATOVS pressure level which is the closest retrieval pressure level to the surface pressure. Always level 40 over sea.)
651	326	1	2	64	Retrieved surface temperature (Bt) (K)
653	327	1	2	64	Water Vapor corrected HIRS channel 8 (Bt) (K)
655	328	1	2	64	Surface temperature estimate for HIRS channel 8 (K)
657	329	1	2	64	Surface temperature estimate for HIRS channel 18 (K)
659	330	1	2	64	Surface temperature estimate for HIRS channel 19 (K)
661	331	42	2	64	First Guess temperature profile (K). See note 1.
743	373	19	2	1024	First Guess water vapor mixing ratio, ln (g/kg). See note 3.
783	392	35	2	64	First Guess radiance temperatures (K). See note 2.

853	427	1	2	64	NCEP forecast potential temperature (K)
855	428	1	2	256	NCEP forecast relative humidity (%)
857	429	1	2	64	NCEP forecast surface temperature (K)
859	430	1	2	10	Adjusted NCEP forecast surface pressure (mb)
861	431	1	2	10	Forecast pressure (mb)
863	432	1	2	100	Potential temperature time minus NCEP forecast time
865	433	1	2	512	Stability departure
867	434	1	2	512	Lower departure
869	435	1	2	512	Upper departure
871	436	1	2	n/a	Time difference (satellite minus forecast)
873	437	1	2	n/a	Stability forecast increment
875	438	1	2	n/a	Cloud liquid water (mm)
877	439	1	2	64	Cloud top temperature (K): 0=clear; -777=missing.
879	440	1	2	n/a	Cloud top pressure (mb): 1250=clear; -777=missing.
881	441	1	2	100	Cloud amount: 0=clear; -777=missing.
883	442	1	2	n/a	Total ozone (dobson units)
885	443	1	2	128	Total precipitable water from 300 mb to 500 mb (mm)
887	444	1	2	128	Total precipitable water from 500 mb to 700 mb (mm)

889	445	1	2	128	Total precipitable water from 700 mb to 1000 mb (mm)
891	446	1	2	n/a	Sulfur Dioxide (ppm or ppb)
893	447	1	2	n/a	Polar redundancy flag: -1=not redundant; 1=redundant.
895	448	1	2	10	Outgoing longwave radiation ( $W/m^2$ )
897	449	1	2	1000	Layer cooling rate (240 mb to 10 mb) ( $W/m^2$ )
899	450	1	2	1000	Layer cooling rate (500 mb to 240 mb) ( $W/m^2$ )
901	451	1	2	1000	Layer cooling rate (700 mb to 500 mb) ( $W/m^2$ )
903	452	1	2	1000	Layer cooling rate (1000 to 700 mb) ( $W/m^2$ )
905	453	1	2	n/a	Cloud comparison flag (cloud detection vs. cloud products): 0 (good) =clear retrieval + clear cloud algorithm 0 (good) = cloudy retrieval + cloudy cloud algorithm 1 (bad) = clear retrieval +cloudy cloud algorithm 2 (so-so)= cloudy retrieval + clear cloud algorithm
907	454	1	2	n/a	Library search closeness (pho) value
909	455	1	2	n/a	Super adiabatic level (1-42) ( level where profile became super adiabatic - set to missing if no super adiabatic levels are found)
911	456	1	2	n/a	HIRS/AMSU-A gross temperature flag: 0=all temperatures within limits; 1=temperatures out of bounds.
913	457	44	2	n/a	Spare

**Notes:**

1. ATOVS Temperature Levels 1-40 in millibars ( 0.1, 0.2, 0.5, 1.0, 1.5, 2, 3, 4, 5, 7, 10, 15, 20, 25, 30, 50, 60, 70, 85, 100, 115, 135, 150, 200, 250, 300, 350, 400, 430, 475, 500, 570, 620, 700, 780, 850, 920, 950, 1000,1012, 1030). Geopotential heights are represented in meters from 115 to 1030 mb, and in decimeters from 0.1 through 100mb. Currently, the parameters for the 1012 and 1030 mb levels are not computed, but are planned for the future.
2. Channel ordering - HIRS channels 1-20 are stored first, then AMSU-A 1-15.
3. ATOVS Water Vapor levels 1-19 in millibars (200, 250, 300, 350, 400, 430, 475, 500, 570, 620, 700, 780, 850, 920, 950, 1000, 1012, and 1030). Currently, the parameters for the 1012 and 1030 mb levels are not computed, but are planned for the future.
4. ATOVS Layer temperature and moisture values 1-15 in millibars (7-10, 10-20, 20-30, 30-50, 50-70, 70-100, 100-150, 150-200, 200-250, 250-300, 300-400, 400-500, 500-700, 700-850, 850-1000). Although the moisture array goes to 7mb, moisture is computed to 200 mb, early ATOVS data goes to 300 mb.
5. Layer thicknesses 1-20 in millibars ( 100-115, 115-135, 135-150, 150-200, 200-250, 250-300, 300-350, 350-400, 400-470, 470-500, 500-570, 570-620, 620-700, 700-780, 780-850, 850-920, 920-950, 950-1000, 1000-1012, 1012-1030). The thickness below 1000mb is not currently computed but is planned for the future.

**Table 9.4.1.1-3. Geographical Bins for ATOVS.**

<b>Class Number</b>	<b>Latitude Zone</b>	<b>Terrain</b>	<b>Day/Night</b>
1	90N to 60N	Sea	Day/Night
2	60N to 45N	Sea	Day/Night
3	45N to 30N	Sea	Day/Night
4	30N to 15N	Sea	Day/Night
5	15N to 15S	Land/Sea	Day/Night
6	15S to 30S	Sea	Day/Night
7	30S to 45S	Sea	Day/Night
8	45S to 60S	Land/Sea	Day/Night

16	60S to 90S	Land	Day
17	90N to 60N	Land	Night
18	60N to 45N	Land	Night
19	45N to 30N	Land	Night
20	30N to 15N	Land	Night
21	15S to 30S	Land	Night
22	30S to 45S	Land	Night
23	60S to 90S	Land	Night

#### 9.4.1.2 ATOVS Sounding Quality Information (Metadata Archive) File

This section describes the format for the ATOVS quality information file. Each week, one record of data is written to this file. The data records contain 3380 Integer\*2 words. Each record contains data for six latitude zones: 90N to 60N, 60N to 30N, 30N to 0, 0 to 30S, 30S to 60S, and 60S to 90S. The file is a rotating file; the first record (header record) is updated each week and contains the start date (year, month, and date of the next week's data, the next available record and the maximum records on the file). There are four data files for each week of Metadata Statistics: 1) Level Temperature statistics; 2) Layer Temperature statistics; 3) Mixing Ratio statistics; and 4) Brightness Temperature statistics. Table 9.4.1.2-1 contains the format for the header record which is the first record in the metadata archive file. Table's 9.4.1.2-2, 9.4.1.2-3, 9.4.1.2-4 and 9.4.1.2-5 contain the formats of the data records.

<b>Table 9.4.1.2-1. Format of Metadata Archive Header Record.</b>					
<b>Start Byte</b>	<b>Data Type</b>	<b># of Values</b>	<b>Length (bytes)</b>	<b>Scale</b>	<b>Description</b>

#### 9.4.1.3 ATOVS Radiosonde Matchup Archive File

The ATOVS data matched to radiosondes will be added to the suite of archived sounding products. The matchups of retrieval and radiosonde have gone through an extensive screening process. Thus, both profiles in the file are considered as 'good' and used as input to the retrieval process. The records in this file are 3,000 bytes in length. Table 9.4.1.3-1 contains the format of the header record for the radiosonde matchup file. Each bin or class also has a header record which is described in Table 9.4.1.3-2. The radiosonde standard levels (in millibars) are: 5, 7, 10, 20, 30, 50, 70, 100, 150, 200, 250, 300, 400, 500, 700, 850 and 1000.

<b>Table 9.4.1.3-1. Format of Header Record for Radiosonde Matchup File.</b>						
<b>Byte</b>	<b>Integer Index</b>	<b>Data Type</b>	<b># of Values</b>	<b>Length</b>	<b>Scale</b>	<b>Description</b>
1	1	Int	1	4	n/a	Date of last file update (YYYYMMDD)

#### 9.4.2 AMSU-B SOUNDING PRODUCTS

In addition to the ATOVS products, NOAA KLM also generates AMSU-B data from which moisture products are generated. The AMSU-B instrument has a FOV of 15 km. The data generated from the AMSU-B instrument is sampled by skipping every other FOV. This generates a product of about 30 km spacing with a maximum of 100,000 retrievals per orbit.

Each archive file consists of all valid sounding data extracted from the original retrieval file for the most recent AMSU-B orbit. Except for the header record, an orbit archive file has all integer terms with data values scaled by numbers such as 64 and 128. The archive file has a block size of 10,720 bytes with record lengths of 268 bytes. The first record of the database is the header (see Table 9.4.2-1) which provides information such as the last record written and the number of records. The header record uses I\*4 words and is the same size as the data records (268 bytes).

<b>Table 9.4.2-1. Header Record Format of Orbit Archive File.</b>				
<b>Starting Byte</b>	<b>I*4 Location</b>	<b>Length (bytes)</b>	<b># of values</b>	<b>Description</b>
1	1	4	1	Number of data records in the file
5	2	4	1	First data record written in file (2)
9	3	4	1	Last data record written
13	4	4	1	Logical record length
17	5	4	1	Spacecraft ID

#### 9.4.2.1 AMSU-B Metadata Archive File

The AMSU-B Metadata Archive File is a rotating file. The first record is updated each week and contains the start date (year, month, and day of the next week’s data, the next available record and the maximum records on the file). The metadata archive file consists of a header record (1,000 bytes), followed by two data files for each week of metadata statistics: one file contains mixing ratio statistics, the other file contains brightness temperature statistics. Table 9.4.2.1-1 contains the format for the header record of the AMSU-B metadata archive file. Tables’ 9.4.2.1-2 and 9.4.2.1-3 contain the formats of the data files.

<b>Table 9.4.2.1-1. Format of the Header Record of the AMSU-B Metadata Archive File.</b>					
<b>Start Byte</b>	<b>Data Type</b>	<b># of values</b>	<b>Length (bytes)</b>	<b>Dimension</b>	<b>Description</b>

301	n/a	700	n/a	Spares

#### 9.4.2.2 AMSU-B Radiosonde Match Archive

A new radiosonde match archive file is created once a month. Each archive file consists of all valid retrieval-radiosonde matches extracted from the AMSU-B Match Archive for the previous month. Except for the header record, the radiosonde match archive file is in all integer format with data values either unscaled or scaled by values from 64 to 1024. The header record provides information such as the last record written and the number of records. All integer values in the header are four bytes long. The records are 2,484 bytes in length with a block size of 27,324 bytes. Table 9.4.2.2-1 contains the format of the header record and Table 9.4.2.2-2 contains the format of the data records for the radiosonde match archive file. In the data records, real values have been stored in I\*2 format after first multiplying the real value by the scaling factor.

**Table 9.4.2.2-1. Format of Header record for AMSU-B Radiosonde Match Archive File.**

Starting Byte	I*4 Location	Length (bytes)	# of values	Description
1	1	4	1	Number of data records in the file
5	2	4	1	First data record written in file (2)

**Notes:**

1. YYMM DDHH mmss, where YY is the year, MM is the month, DD is the day, HH is the hour, mm is the minute, and ss is the number of seconds (UTC).
2. 0=good; 1=good, but redundant; 2=questionable; 3=bad; 4=experimental flag; 5=precipitating.
3. Mixing ratios are converted to their natural logs before being scaled.
4. The synoptic day for which the observation was made (YYMMDD).
5. The day that the balloon was actually released (YYMMDD). For observations at 0000z, the balloon is actually released at approximately 2330z. The balloon release time is frequently reported as the observation time, although the synoptic time is more commonly reported. In order to sort observations into chronological order, the balloon release date and time should be used.
6. Each byte represents a different flag, set to a character value "0" if FALSE and to the character value "1", if TRUE.

## 9.5 COASTWATCH PRODUCTS

The CoastWatch Program mission is to provide and ensure timely access to near real-time satellite data to protect, restore, and manage U.S. coastal ocean resources, and understand climate variability and change to further enhance society's quality of life. Primary users include Federal, State, and local marine scientists, coastal resource managers, and the general public. CoastWatch is comprised of two components: Central Operations and Regional Nodes. Central Operations, managed by NOAA's National Environmental Satellite, Data, and Information Service (NESDIS) coordinates the processing, delivery, quality control and storage of data products. The six regional nodes are made up of other NOAA line offices that participate in the CoastWatch Program. They are located around the country, hosting equipment and personnel to provide near real-time data distribution and regional scientific expertise to the local user community. Together, central operations and the regional nodes provide for the distribution pathway for CoastWatch data products (see Section 9.5.1 for further information on central operations and the regional nodes).

CoastWatch started with only POES/AVHRR SST data for the East Coast in 1987, but now provides a variety of imagery and data from several different platforms covering all U.S. coastal waters. All products are available through the CoastWatch website product search: <http://coastwatch.noaa.gov/interface/interface.html> Note: since this User's Guide deals exclusively with POES data, emphasis will be placed on the POES CoastWatch products. Use this link for additional information on CoastWatch POES/AVHRR data [http://coastwatch.noaa.gov/poes\\_sst\\_overview.html](http://coastwatch.noaa.gov/poes_sst_overview.html).

The images displayed on the NOAA CoastWatch website are created from satellite datasets. For many uses, these images provide enough information and are easily viewed over the Internet. However, the datasets are not viewable by Internet browsers and may require specialized

software to view, manipulate, and extract the information as needed. CoastWatch provides software utilities and data primers to assist in using these data products. [http://coastwatch.noaa.gov/cw\\_software.html](http://coastwatch.noaa.gov/cw_software.html)

Retrospective availability of CoastWatch POES data products are provided through a remotely accessible system at the Comprehensive Large Array-data Stewardship System (CLASS) website: <http://www.class.noaa.gov/nsaa/products/welcome>. CLASS replaces the Satellite Active Archive and their website provides users with data formats and details pertinent to the type of CoastWatch data the user chooses to download.

CoastWatch data products utilize five receiving stations around the country that collect data from the AVHRR sensor on the NOAA KLM polar orbiting spacecrafts. They include Gilmore Creek, AK for the four Alaska regions; Monterey, CA for the West Coast; Miami, FL for the Caribbean and Gulf of Mexico waters; Ewa Beach, HI for Central Pacific; and Wallops Island, VA for the East Coast and Great Lakes. Data are processed on NOAA computers in Suitland, MD using a set of NOAA developed multi-channel atmospherically corrected algorithms for determination of sea surface temperature. Data are then mapped to predefined coordinates specified for each of the CoastWatch regions.

**Table 9.5-1. CoastWatch Region Specifications.**

Region Code	Region Name	Latitude	Longitude	Res. (km)	Size		Map Projection
					Rows	Cols	
aa	Alaska Sitka	45.949	-179.07	5.0	512	512	Polar Stereographic

### Variable Naming Conventions

Each HDF data file contains multiple data variables stored using the HDF Scientific Data Sets (SDS) model. Each variable is named according to the data that it represents as follows:

avhrr\_ch1

AVHRR channel 1 albedo (%)

avhrr\_ch2

AVHRR channel 2 albedo (%)

avhrr\_ch3a

AVHRR channel 3a albedo (%)

avhrr\_ch3

AVHRR channel 3 brightness temperature (deg C)

avhrr\_ch4

AVHRR channel 4 brightness temperature (deg C)

avhrr\_ch5

AVHRR channel 5 brightness temperature (deg C)

sst

Moisture corrected sea-surface-temperature (deg C)

cloud

8-bit CLAVR ocean cloud mask:

Daytime

Bit 1: Reflective Gross Cloud Test

Bit 2: Reflectance Uniformity Test

Bit 3: Reflectance Ratio Cloud Test

Bit 4: Channel 3 Albedo Test

Bit 5: Thermal Uniformity Test

Bit 6: Four Minus Five Test

Bit 7: Thermal Gross Cloud Test

Nighttime

Bit 1: Thermal Gross Cloud Test

Bit 2: Thermal Uniformity Test

Bit 3: Uniform Low Stratus Test

Bit 4: Four Minus Five Test

Bit 5: Cirrus Test

Bit 6: Channel 3B Albedo Test

Bit 7: Channel 3B Albedo Uniformity Test

sat\_zenith

Satellite zenith angle (degrees)  
sun\_zenith  
Solar zenith angle (degrees)  
rel\_azimuth  
Relative azimuth angle (degrees)  
graphics  
8-bit graphics layers:  
Bit 1: Fill flag  
Bit 2: Latitude/longitude grid  
Bit 3: Coastline and political geography lines  
Bit 4: Land/water flag  
Bits 5-8: Unused

\*Note: AVHRR channels 1 and 2, solar zenith, and relative azimuth angles are only useful for daytime data; therefore these variables are omitted from the nighttime data files.

## 9.5.1 HOW TO OBTAIN COASTWATCH DATA

### 9.5.1.1 CoastWatch Regional Nodes

*Alaska* - Gary Hufford  
NOAA/NWS - Alaska Region

## **9.6 INTEGRATED SURFACE AND PRECIPITATION PRODUCTS**

The following sections describe the newest operational products using a variety of sensors flown on NOAA's satellites. Many of the products are created by integrating data from several sensors, which creates instrument/spectrum-independent, parameter-independent, and platform-independent timely products to help meteorologists and climatologists monitor and forecast changes in surface and atmospheric conditions.

NESDIS has an extensive history of monitoring snow and ice coverage. Accurate monitoring of global snow/ice cover is a key component in the study of climate and global change as well as daily weather forecasting. NESDIS has been creating maps showing the extent of snow and ice cover for the Northern Hemisphere since 1966. The snow and ice maps were produced weekly at a spatial resolution of 190 km from 1966 to 1999.. The Interactive Multisensor Snow and Ice Mapping System (IMS) replaced the weekly mapping process in June 1999 and improved the snow and ice map by producing daily maps at 23 km resolution, using a consolidated array of new as well as existing satellite and surface imagery products. Another large resolution improvement began in early 2004, when improved technology allowed the creation of a daily 4 km (6144x6144) chart. These charts can be ordered from the [National Climatic Data Center](#).

The Microwave Surface and Precipitation Products System (MSPPS) produced near real-time operational surface and precipitation products from the AMSU-A, AMSU-B and MHS

instruments aboard NOAA and METOP satellites. The operational products included Antenna Temperatures, Total Precipitable Water, Cloud Liquid Water, Sea Ice Concentration, Land Surface Temperature, Land Surface Emissivity at 23.8, 31.4 and 50.3 GHz, Snow Cover, Rain Rate, Snow Water Equivalent and Ice-Water Path. Both Level-II (orbital) and Level-III (grid) products are available. The MSPPS grid products include Snow Cover, Rain Rate and Snow-Water Equivalent from AMSU-B/MHS and Sea Ice Concentration from AMSU-A. These level 3 geophysical products are mapped with the 1/16th-mesh Polar Stereographic projection and updated daily. They are available in HDF-EOS format for the period from 1998 to 2007 in CLASS.

The MSPPS was replaced by the Microwave Integrated Retrieval System (MIRS) in August 2007. The MIRS has an end to end capability of calibrating and characterizing the radiances measured from satellite-based microwave instruments, and retrieving the environmental data records with state-of-the-art algorithm science. It is a one-stop resource for microwave-derived products from various polar-orbiting satellite instrument configurations. The MIRS strength is derived from being instrument/spectrum-independent, parameter-independent, and platform-independent.

#### 9.6.1 WEEKLY SNOW AND ICE MAPPING

During the 1966 to 1999 weekly snow and ice mapping era, the primary data source was Advanced Very High Resolution Radiometer (AVHRR) hardcopy visible imagery acquired from NOAA Polar Operational Environmental Satellite (POES, United States). Secondary data sources included on-line visible imagery from Geostationary Operational Environmental Satellite (GOES, U.S.), Geostationary Meteorological Satellite (GMS, Japan), and European Meteorological Satellite (METEOSAT, European Organization for the Exploitation of Meteorological Satellites), hardcopy National Ice Center (NIC, U.S.) sea ice edge maps, the United States Air Force (USAF) three-dimensional (3-D) Nephanalysis snow product, and surface observations. These products became available at various times in subsequent years. The two crucial problems with the weekly product when used for short-term forecasting were its temporal and spatial resolution. The infrequency of the weekly product created significant errors in the near surface temperature forecasts when the map was used for initialization of the National Weather Service's (NWS) Numerical Weather Prediction (NWP) models, and the grid used in the models had a higher resolution than the weekly snow and ice map.

Snow and ice cover identification was made by the manual inspection of hardcopy polar orbiting satellite imagery and graphics products, on-line video loops of multiple geostationary satellite images, and the previous week's analysis. The former process was largely manual and time consuming, and took up to ten hours to produce a map during the snow season. Map quality was dependent upon the availability of clear sky visible satellite imagery and the meteorologist's experience. The analysis from the previous week was carried forward when cloud cover obstructed the view of the snow/ice boundary during the entire week. The final hardcopy 190 kilometer resolution snow and ice chart was prepared by the analyst by manually transferring the

observed boundary lines to the map after all snow and ice boundaries were identified. The polar stereographic base map displayed coastlines, seas and large lakes, international and U.S. state political boundaries, and a latitude-longitude grid. Snow cover was indicated by the irregular solid black lines contiguous with the stippling. Ice cover was delineated by the base map's coastlines and contiguous open circles. The map's key listed the satellites from which imagery was used in preparing the final map. Each week the analyst drew a new map by hand, then digitized the extent of snow and ice cover through the use of an 89x89 line grid overlaid on a polar stereographic map of the Northern Hemisphere which created an electronic version for archival storage at the National Climate Data Center (NCDC). Quality control was either self-imposed by the meteorologist performing the analysis or by the focal point meteorologist. Upon completion, the hardcopy snow and ice chart was faxed to users in the NWS National Centers for Environmental Prediction (NCEP) which included the Environmental Modeling Center and the Climate Prediction Center, the U.S. Department of Agriculture, universities, foreign governments, and other customers.

#### 9.6.2 INTERACTIVE MULTISENSOR SNOW AND ICE MAPPING SYSTEM: 1999 - PRESENT

The Interactive Multisensor Snow and Ice Mapping System (IMS) was designed and built to improve the previously produced weekly snow and ice map by producing a more accurate, timely product. Clear sky imagery from both the NOAA POES and GOES show the snow line very well. The problem is that current visible and infrared analysis techniques suffer from persistent cloud cover near the snow boundary. This makes daily observations difficult and infrequent. Microwave snow products are generally independent of cloud cover. However, snow and ice analyses based on visible, infrared, or microwave satellite imagery have varying accuracies under certain environmental conditions or over specific types of terrain. It's therefore advantageous to allow a meteorologist to assess satellite imagery and derived snow maps from multiple remote sensing instruments and data sources, and from them interactively produce a composite that is more accurate than the individual snow cover maps.

IMS is a UNIX-based workstation application. It provides the capability for an analyst to create, save, edit, and distribute maps showing the extent of snow and ice cover over the Earth's Northern Hemisphere with a resolution of 23 kilometers. Snow and ice mapping is performed daily in approximately one to two hours. New data sources available on the workstation, in addition to the data sets used in producing the former weekly snow and ice map (see Section 9.6.1), include the Special Sensor Microwave/Imager (SSM/I) snow map from Defense Meteorological Satellite Program (DMSP) satellites, daily snow maps from the NWS National Operational Hydrologic Remote Sensing Center (NOHRSC), and NOAA-15's Advanced Microwave Sounding Unit (AMSU) snow cover map. Imagery from the AVHRR/3 1.6 micron channel, selected for its ability to discriminate snow cover from clouds, will be provided by NOAA-16. Data overlays of elevation contours, coastlines and rivers, and geopolitical boundaries are also available. IMS editing features allow toggling between two or more snow maps and other mapped data sets, such as land cover maps. The software produces a final snow map with appropriate header information and with an ancillary map containing information about

data sources and quality flags.

The IMS workstation's graphical user interface (GUI) is able to display an entire Northern Hemisphere daily snow and ice map or portions thereof. The snow and ice map depicts snow in white, ice in yellow, land in beige, and water in dark blue. The GUI provides pull down menus in the upper left corner of the screen for file retrieval and storage, access to editing tools, image display, annotation of images, and access to help text. A tool palette of draw and edit icons is located on the upper right side of the screen. These icons provide the means for map rotation in 90 degree units, undoing the last action taken, the exclusive drawing and erasure of snow and ice, zooming in on a given area, reversion from zoom mode to a normal view (a 1024x1024 pixel matrix), clearing the screen of snow or ice, and fine detail addition or deletion of snow or ice in non-contiguous snow or ice areas. Static overlay buttons provide data layers consisting of coastlines, elevation at 500 meter intervals, land use, latitude-longitude grid, international boundaries, U.S. state and Canadian provincial political boundaries, rivers and lakes, climatological snow maps and vegetation indices. Other available functions include the option to clear the overlays or imagery from the screen as well as toggling between two images or maps. The command line of buttons at the bottom of the GUI provides access to a variety of imagery and derived products including visible imagery from AVHRR, GOES, GMS, and METEOSAT, microwave products derived from SSM/I and AMSU data, snow and ice maps from NOHRSC, NIC, and USAF daily snow analyses, as well as surface observations from manual and automated weather stations. Production of a daily Northern Hemisphere experimental product began in February 1997. Operational implementation of IMS was completed in November 1997 and formally replaced the weekly product in June 1999. The current daily digital product is in ASCII format and archived at the National Snow and Ice Data Center (NSIDC: <http://nsidc.org/index.html>). A 15 month validation, funded by NOAA's Office of Global Programs, was conducted over two snow seasons in which the weekly and daily products were produced in parallel. A digital weekly snow and ice map will be derived from the daily digital products for comparison with the current weekly product and for continuation into the future of the satellite derived weekly snow and ice map climatological record begun in 1966. The results of the validation will be published. Feedback from the snow and ice community on the IMS daily product is welcome and encouraged. It is routinely posted on the NOAA/NESDIS Office of Satellite Data Processing and Distribution's (OSDPD) home page (<http://www.osdpd.noaa.gov>) and on the NOAA/NESDIS/OSDPD Satellite Services Division's home page at (<http://www.ssd.noaa.gov/>).

In summary, digital snow and ice map products archived at NSIDC (<http://nsidc.org/noaa/>) consist or will consist of the following:

- 1024x1024 daily snow and ice map
- 1024x1024 weekly snow and ice map (to be derived from the daily product)
- 89x89 weekly snow and ice map (derived from the weekly snow and ice map)

### 9.6.3 Microwave Surface and Precipitation Products System (MSPPS) Day-2 System

The first AMSU-A and -B instruments were launched on NOAA-15 on May 13, 1998. These instruments provided a new opportunity to produce microwave surface and precipitation products from NOAA polar orbiter satellites similar to the microwave surface and precipitation products [known as Environmental Data Records (EDRs)] produced by Fleet Numerical Meteorology and Oceanography Center (FNMOC) from the Defense Meteorological Satellite Program's (DMSP) Special Sensor Microwave/Imager (SSM/I) instrument. The Special Sensor Microwave/ Temperature (SSM/T) and Special Sensor Microwave/moisture (SSM/T-2) sounders (both cross-track instruments), along with the SSM/I (conical scanner), provided valuable data to expedite both sounding and MSPPS algorithm development. The commonality of the AMSU-A and -B instrument suite with the current DMSP SSM/T/I/T-2 suite of instruments, as well as the future DMSP Special Sensor Microwave/Imager-Sounder (SSM-IS) (conical scanner) is illustrated in Table 9.6.3-1. AMSU-A is a 15-channel cross-track scanning passive microwave radiometer. An AMSU-A scan takes eight seconds and is comprised of 30 Earth views. AMSU-B is a five channel cross-track scanning passive microwave radiometer. An AMSU-B scan takes 8/3 seconds and is comprised of 90 Earth views.

<b>Table 9.6.3-1. Comparison of Microwave Sensors</b>

				See Note 3	75 x 75
<b>Notes:</b>					
1. H and V refer to horizontal and vertical polarization, respectively.					
2. These SSM-IS channels are not polarization dependent.					
3. SSM-IS has 6 additional narrow band channels in the frequency range of 60,000 to 63,000 MHz.					

The lineage of MSPPS at NOAA/NESDIS includes the generation of orbital and gridded (Mastermap) products from SSM/I "raw" data transmitted via the Shared Processing Network (SPN) from Air Force Global Weather Central (AFGWC). Both of these systems were intended to produce experimental products until FNMOC was ready to begin transmission of the official SSM/I operational products over SPN. In 1992, FNMOC began transmitting Temperature Data Records (TDR), Sensor Data Records (SDR), and Environmental Data Records (EDRs) to NESDIS via SPN. NESDIS processed the SDRs and EDRs into 30-orbit files and mapped the EDRs and SDRs into Mastermap files (eighth-mesh polar stereographic maps). Under the auspices of the NOAA Climate and Global Change Program, a prototype Microwave Climate System (MCS) was developed. MCS entailed the production of orbital Brightness Temperatures (BTs) from the seven SSM/I channels as well as total precipitable water and rain rate products from the EDRs and from the BTs using experimental algorithms. Besides the orbital files, daily,

pentad (five-day), and monthly climate products were generated and archived. The design and development of MCS provided the foundation and fundamental "building blocks" for the design of MSPPS.

The design philosophy of MSPPS is to maintain commonality with MCS to the extent possible realizing that the generation of real-time and climate products have much in common, as do the generation of products from different microwave instruments such as SSM/I, AMSU-A and AMSU-B.

MSPPS produces near real-time operational surface and precipitation products from the AMSU-A and AMSU-B instruments. The products are listed in Table 9.6.3-2.

<b>Table 9.6.3-2. AMSU-A and -B Products.</b>		
<b>Product</b>	<b>AMSU-A</b>	<b>AMSU-B</b>
Antenna Temperatures (AT)	X	X
Total Precipitable Water (TPW)	X	
Cloud Liquid Water (CLW)	X	
Sea Ice Concentration	X	
Surface Emissivity at 23.8 GHz	X	
Surface Emissivity at 31.4 GHz	X	
Surface Emissivity at 50.3 GHz	X	
Surface (skin) Temperature	X	
Snow Cover (Yes or No)		X
Rain Rate		X
Ice Water Path		X

Operational MSPPS includes three integrated subsystems:

- 1) AMSU-A Orbital Products Generation (OPG);
- 2) AMSU-B OPG; and
- 3) AMSU-A/B Mapped Orbital Products (MOP).

AMSU-A OPG processing is initiated by converting the Level 1b\* AMSU-A data (Level 1b\* is a centralized database which contains the basic elements of the Level 1b and the associated supporting ancillary data) from IBM MVS to IEEE format; then antenna temperatures and geophysical products are computed and stored in HDF-EOS Swath files (with compression). The MSU-A OPG data are available on an orbital basis. An AMSU-A Snow Cover Product can be computed but is not currently being done since the AMSU-B product is available and improved with respect to the AMSU-A product. Likewise, the AMSU-A Rain Rate Product is

not computed since the superior AMSU-B product is available. The AMSU-A products would be turned on for output if the AMSU-B processing stream fails. The AMSU-A Swath output is available as NPR.AAOP.

AMSU-B OPG processing first converts the AMSU-B Level 1b\* data from IBM MVS to IEEE format, then computes the AMSU-B antenna temperatures (ATs), and stores the AMSU-B antenna temperatures and ancillary data in AMSU-B HDF-EOS Swath files (with compression). Then, the relevant AMSU-A ATs and geophysical products from the AMSU-A Swath file and the AMSU-B Swath file from the previous step are read; the AMSU-B geophysical products are computed and appended to AMSU-B HDF-EOS Swath files (with compression). The AMSU-B OPG data are available on an orbital basis. The AMSU-B Swath output is available as NPR.ABOP.

AMSU-B MOP processing generates mapped geophysical products on an orbit-by-orbit basis. These mapped AMSU surface and precipitation products are written into a rotating file so that portions of the file are overwritten orbitally. In this manner, the MOP satisfies the requirements that necessitate the mapped products to be updated orbitally. The output from the AMSU-A OPG and the AMSU-B OPG serve as the input to the AMSU-B product mapping. Currently, sea-ice, snow and the rain rate products are written to a 1/16<sup>th</sup>-mesh Polar Stereographic (1024x1024) projection. For a complete description of the mapping algorithm see the NOAA KLM User's Guide - Appendix C (URL:

<http://www.ncdc.noaa.gov/oa/pod-guide/ncdc/docs/klm/html/c/app-c.htm>).

The rain rate was added to the MOP file on January 10, 2002. The snow and sea ice products are composited from descending orbital data only, while the rain rate is composited from both descending and ascending data. The AMSU-B MOP output files, NPR.ABMP, are in HDF-EOS Grid format (with compression).

As part of Product Validation on the Research System version of MSPPS, selected Mapped Daily Products (MDP) are created. The MSPPS has been extended to meet climate requirements, climate subsystems for Daily, Pentad, and Monthly product generation have been created.

HDF-EOS was chosen as the standard output format for MSPPS for a variety of reasons. First, there are the inherent attributes of HDF-EOS forming the basis for its selection as the standard format for EOS. Some of these are: support for multiple data objects; coupling of geolocation with the data, resulting in subsetting capabilities; self defining (self documented); supports internal compression; portable; non-proprietary; and widespread use. Second, because of its widespread use and being a standard, an extremely large suite of tools for HDF-EOS and applications that support HDF-EOS are anticipated

MSPPS Level-2 and Level-3 data are stored in the HDF-EOS format, an extension of National Center for Supercomputing Application's (NCSA) HDF (URL: <http://www.hdfgroup.org/>)

developed by NASA to support its Earth Observing System (EOS). Among other attributes, the multi-object HDF-EOS format that supports compression is portable, flexible, and self-defining. For an overview of HDF and HDF-EOS, refer to the excellent Primer at URL: <http://edhs1.gsfc.nasa.gov/waisdata/sdp/pdf/wp1750102.pdf>. HDF-EOS enhances the flexibility of HDF by permitting temporal and spatial subsetting. Traditionally, product files have been in a fixed format requiring up-to-date external documentation describing the format. To accommodate changes in format, spares are often included. If additional changes in format are required, users must rewrite their data-read modules. The self-defining nature of HDF-EOS greatly reduces the impact of any change in format on the user. The HDF\_EOS tools can be downloaded from the library found at URL: <http://www.hdfgroup.org/hdf/tools.html>

Currently, MSPPS files “NPR.AAOP”, “NPR.ABOP”, and “NPR.ABMP” are archived at NCDC and are available from the CLASS at URL: <http://www.class.noaa.gov>. Although the MSPPS Day-2 files have the same type of naming convention as the Day-1 files, the formats are slightly different. The change-over to Day-2 files for archive occurred in August 2001.

The major differences between the Day-1 and Day-2 file are parameter names. Several parameters appear in the Day-1 Data Sets that should not be used and were only included as either potential parameters or spare fields. These include a QC field and a surface elevation field. In the Day-1 AMSU-A Swath file the surface type parameter is not valid; whereas the surface type is valid for the Day-1 AMSU-B swath data. The major differences between the Day-1 and Day-2 file are delineated in Table 9.6.3-3.

<b>Table 9.6.3-3. Difference between Day-1 and Day-2 Files.</b>	
<b>Day-1</b>	<b>Day-2</b>
AMSU-A and AMSU-B Swath Files	
Surface_type (not a valid parameter - AMSU-A only)	Sfc_type (valid)
Antenna Temperatures assigned to variable - Chan_xBT (x is channel number) Note: incorrectly named variable	Antenna Temperatures - Chanx_AT (x is channel number)
AMSU-A Swath Files	
Full set of products	As listed in Table 9.6.3-2
AMSU-B Swath Files	
Channel Temperatures only	As listed in Table 9.6.3-2
Mapped Data File	

1/8th mesh (512 x 512) Polar Stereographic	1/16th mesh (1024 x 1024) Polar Stereographic
TPW, CLW, Sea Ice, Snow Cover and Rain Rate	Snow and Sea Ice (rain rate added January 2002)

Access routines for the HDF-EOS AMSU-A and AMSU-B swath files and the HDF-EOS MSPPS Polar Stereographic Mapped file are available for download at URL: <ftp://ftp2.ncdc.noaa.gov/pub/doc/klmguide/meta/>. There are three directories called: AMSU-A, AMSU-B, and PSmap. Each of these directories contains three sub-directories: input, output, and src. Refer to the “README” file in the “src” sub-directory for instructions about retrieving data from the designated file type.

For general information about the Microwave Surface and Precipitation Products System, see the MSPPS home page at URL: <http://www.orbit.nesdis.noaa.gov/corp/scsb/mspps/main.html>. There are links to discussions of the product algorithms, case studies, product monitoring, presentations, MSPPS documentation, and more.

Tables 9.6.3-3 and 9.6.3-4 contain the format of AMSU-A HDF-EOS swath for NPR.AAOP files and attributes, respectively. Tables 9.6.3-5, 9.6.3-6 and 9.6.3-7 contain the format of AMSU-B HDF-EOS swath for NPR.ABOP files, attributes and polar stereographic grid for NPR.ABMP files.

<b>Table 9.6.3-4. AMSU-A HDF-EOS Swath: NPR.AAOP files on DDS.</b>				
<b>Parameter Name</b>	<b>Data Type</b>	<b>Missing Data</b>	<b>Scale</b>	<b>Explanation</b>
ScanTime_year	I*2	0 (See Note 1)	1	Four digit calendar year (e.g., 1999)
ScanTime_month	I*1	0 (See Note 1)	1	Month of year (e.g., 1-12)
ScanTime_dom	I*1	0 (See Note 1)	1	Day of month (e.g., 1-31)
ScanTime_hour	I*1	0 (See Note 1)	1	Hour of day (e.g., 0-23)
ScanTime_minute	I*1	0 (See Note 1)	1	Minute of hour (e.g., 0-59)
ScanTime_second	I*1	0 (See Note 1)	1	Second of minute (e.g., 0-59)
ScanTime_doy	I*2	0 (See Note 1)	1	Day of year (e.g., 1-366)
Latitude	R*4	0 (See Note 1)	1	Latitude (degrees, e.g., -90 to 90)
Longitude	R*4	0 (See Note 1)	1	Longitude (degrees, e.g., -180 to 180)
Time	R*8	0 (See Note 1)	1	Number of seconds and fractions since 0000 UTC Jan. 1, 1993 (TAI93)

South_Snow	I*2	See Table 9.6.3.1-9	Snow Cover (%; 0 or 100; 100 = snow, negative values are flags)
South_Sice	I*2	See Table 9.6.3.1-9	Sea ice concentration (%; 0 -100, negative values are flags)

Table 9.6.3-9 contains an explanation of the product error flags used for MSPPS data.

<b>Table 9.6.3-9. Product Error Flags.</b>	
<b>Flag Value</b>	<b>Explanation</b>
-1	Calculated product value larger than its upper limit.
-2	Calculated product value less than its lower limit.
-3	Calculated antenna temperature larger than its upper limit.
-4	Calculated antenna temperature less than its lower limit.
-5	Undetermined because of undetermined cloud liquid water.
-6	Undetermined because of possible rain.
-7	Undetermined because of possible snow.
-8	Undetermined because of possible sea ice.
-9	Undetermined because of coast.
-10	Undetermined because of unknown reasons.
-11	Undetermined because of possible desert.

-12	Undetermined because of elevation (> 3000 m).

#### 9.6.4 Microwave Integrated Retrieval System Products

The Microwave Integrated Retrieval System (MIRS) was developed with an end to end capability of calibrating and characterizing the radiances measured from satellite-based microwave instruments, and retrieving the environmental data records with state-of-the-art algorithm science. The MIRS replaced the MSPPS on August 30, 2007. There are currently no plans to reprocess the MSPPS data into the MIRS format. This system is an upgrade from the NESDIS operational MSPPS and is a one-stop resource for microwave-derived products from various polar-orbiting satellite instrument configurations. The MIRS is capable of optimally retrieving atmospheric and surface state parameters and provides physical-based retrievals/products in a consistent fashion. The MIRS is also designed to be instrument/spectrum-independent, parameter-independent, and platform-independent. MIRS produces advanced near-real-time operational surface and precipitation products in all-weather and over all-surface conditions using brightness temperatures from multiple microwave instruments.

These instruments include the Advanced Microwave Sounding Unit-A (AMSU-A) and Microwave Humidity Sounder (MHS) on board the Initial Joint Polar-orbiting Operational Satellite (JPoS) System (NOAA-N, -N', MetOp-1, -2, -3), the Special Sensor Microwave Imager/Sounder (SSMIS) on Defense Meteorological Satellite Program (DMSP) F-16, F-17, F-18, F-19 and F-20 polar satellites, and the Advanced Technology Microwave Sounder (ATMS) that will fly on National Polar-orbiting Operational Environmental Satellite System (NPOESS) and on NPOESS Preparatory Project (NPP).

Operational products currently and will include: vertical profiles of temperature, moisture and hydrometeors, and also rain rate, total precipitable water, cloud liquid water, falling snow, snow cover, snow water equivalent, sea ice concentration, ice water path, surface emissivity spectra and land surface temperature.

The following table shows the current delivery schedule to CLASS and the available operational products from each version.

<b>Table 9.6.4-1 POES and MetOp Deliverables</b>	
<b>POES &amp; MetOp Deliverables</b>	<b>Delivery Time/MIRS version</b>
<ul style="list-style-type: none"> <li>- Temperature Profiles (T(z)) (over ocean)</li> <li>- Moisture Profiles (q(z)) (over ocean)</li> <li>- Total Precipitable Water (TPW) (over ocean)</li> <li>- Land Surface Emissivity (LSE)</li> <li>- Land Surface Temperature (LST)</li> </ul>	Version 1.0 August/September 2007

- Cloud Liquid Water (CLW) (over ocean) - Snow Water Equivalent (SWE) - Snow Cover - Sea Ice Concentration - T(z) (extension to non-oceanic surfaces) - q(z) (extension to non-oceanic surfaces) - TPW (extension to non-oceanic surfaces)	Version 2.0 February 2008
- Hydrometeor Profiles (Hy(z)) (includes profiles of mixing ratio of cloud, rain, graupel, snow and ice particles) from NOAA-18 and MetOp-A - Ice Water Path (IWP)	Version 3.0 August 2008
- Rainfall Rate (RR)	Version 4.0 February 2009

Additional products will be added as they become operational.

#### 9.6.4.1 MIRS File Naming Convention

The MIRS file naming convention is similar to the standard Level 1b file naming convention. There are significant differences. The filename has the following format:

**<PROCESSING-CENTER>.<PROJECT-ID>.<VERSION>.<PRODUCT-TYPE>.<SENEOR-ID>.<SPACECRAFT\_ID>.<YEAR-DAY>.<START-TIME>.<STOP-TIME>.<PROCESSING-BLOCK-ID>.<SOURCE>.<FILE-TYPE>**

Where:

**PROCESSING-CENTER** = Processing-Center where the data were created. **Length:** 3 char. **Domain:**

“NPR” = NOAA/NESDIS Product – Suitland, Maryland, USA

**PROJECT-ID** = Identifies the project name. **Length:** 4 char. **Domain:**

“MIRS” = Microwave Integrated Retrieval System (fixed)

**VERSION** = The product’s algorithm version number **Length:** 2 char. **Domain:** “V1”

**PRODUCT-TYPE** = Identifies the type of product. **Length:** 3 char. **Domain:**

“SND” = 3-dimensional sounding-type products.

“IMG” = 2-dimensional surface and precipitation type products.

Note that the filename convention covers two types of products, and each type includes a suite of individual products. For example, the “SND” file will contain three sounding profiles: T(z), Q(z) and hydrometeor(Z), and the “IMG” file will contain 9 integrated precipitation and surface products: TPW, CLW, RR, SWE, Snow Cover, Sea Ice, LSE, LST and IWP. This approach allows one file to store duplicate geolocation and other auxiliary data for each individual product type.

**SENSOR-ID** = Short name for the instrument used to derive the product. **Length:** 4 to 5 char.

**Domain:**

“AAMH”= derived from combined AMSU-A and MHS data on POES/MetOp spacecraft.

“SSMIS” = derived from SSMIS data on DMSP.

“ATMS”= derived from ATMS data on NPP

**SPACECRAFT\_ID** = Spacecraft-Unique-ID. **Length:** 2 char. **Domain:**

“NN” = NOAA-18 (NOAA-N)

“SA” = DMSP Air Force F16

“SB” = DMSP Air Force F17

“M2” = MetOp-2

**YEAR-DAY** = Year-Day. E.g. “D79104”, where “D” identifies this group as a Julian day delimiter, “79” identifies the year in which the spacecraft began recording the data set and “104” identifies the Julian day on which the spacecraft began recording the data set. **Length:** 6 char. (5 characters for the date string, plus one for the “D” at the beginning). **Domain:** “D”+”YYJJJ”

**START-TIME** = e.g. “S1355”, where “S” identifies this group as a start time delimiter. “1355” denotes 13 hours 55 minutes UTC (to the nearest minute) and represents the time at which spacecraft recording began. **Length:** 5 char. (4 characters for the time string, plus one for the “S” at the beginning). **Domain:** “S”+”HHMM”

**STOP-TIME** = e.g. “E1456”, where “E” identifies this group as an end time delimiter. “1456” denotes 14 hours 56 minutes UTC (to the nearest minute) and denotes the time of spacecraft recording of the last usable data in the data set. **Length:** 5 char. (4 characters for the time string, plus one for the “E” at the beginning). **Domain:** “E”+”HHMM”

**PROCESSING-BLOCK-ID** = e.g. “B0016465”, where “B” identifies this group as a processing block ID delimiter. “0016465” is a seven digit number identifying the spacecraft revolution (orbit) in which recording of this data set began and the revolution in which the recording of the data set ended (the first five digits identifying the beginning revolution and the last two being the two least significant digits of the ending revolution). **Length:** 8 char. (7 characters for the orbit number, plus one for the “B” at the beginning). **Domain:** “B”+”XXXXXXX”

**SOURCE** = Identifies the data acquisition source. **Length:** 2 char. **Domain:**

“NS” = Fixed field designating No Station.

**FILE-TYPE** = File extension that indicates file type. **Length:** variable. **Domain:** “hdf”, “he4”, “netcdf”, “bin”, etc.

**Filename example:**

NPR.MIRS.V0.SND.AAMH.NN.D07077.S0855.E1030.B0940405.NS.he4

9.6.4.2 Dynamic Metadata to be Captured

This section identifies the subset of granule (dynamic) metadata attributes to be used by the Archive and the valid range of values that will be used for validation of these attributes. Listed below are the metadata items to be utilized by the Archive. The “Source” column indicates the location of a particular metadata element. The “Use” column indicates how the metadata item will be utilized within the Archive: “S” for searching; “D” for displaying in the search results; or “SD” for both searching and displaying.

**Table 9.6.4.2-1 Dynamic Metadata**

<b>Field Name</b>	<b>Source</b>	<b>Data Type</b>	<b>Description</b>	<b>Range of Values</b>	<b>Use</b>
Data Type	Filename	String	The MIRS product type refers to whether the product file contains 3-dimensional sounding-type products or 2-dimensional surface/precip-type products. This is determined from three characters in the filename. The MIRS products suite contains the following products: Temperature profiles, moisture profiles, hydrometeor profiles, Rain Rate, Total Precipitable Water or TPW, Cloud Liquid Water or CLW, Snow Cover, Sea Ice, Snow Water Equivalent or SWE, Skin Temperature or LST, Land Surface Emissivity or LSE. All products are 2-dimensional surface/precip-type products except Temperature, Moisture and Hydrometeor profiles, which are 3-dimensional sounding-type products.	Product type: "SND", "IMG"  Sensor: "AAMH", "SSMIS", and "ATMS"	SD
MIRS Version	Filename	String	The product's algorithm version number.	Currently "V1"	SD
Sensor	Filename	String	The instrument used to derive the product	Sensors: "AAMH", "SSMIS", "ATMS"	SD

Spacecraft-Unique-Id	Filename	String	Two characters identifying the platform.	"NN" = NOAA-18 "SA" = DMSP Air Force F16 "SB" = DMSP Air Force F17 "M2" = MetOp-2	SD
Start / Stop Time delimiter	Filename	String	Denotes to the nearest minute the time at which instrument recording began and ended.	"S"+"HHMM" "E"+"HHMM"	SD
Orbit / Processing Block ID	Filename	String	A seven digit number, preceded by "B", identifying the spacecraft revolution (orbit) in which recording of this data set began and the revolution in which the recording of the data set ended (the first five digits identifying the beginning revolution and the last two being the two least significant digits of the ending revolution).	N/A	D
File Format	Filename	String	Note that initial format will be HDF-EOS 4, yet BUFR and NetCDF formats should be available later during the FY09 time frame when the full suite of MIRS products is available. This may occur earlier if there is a strong user request.	"he4", for HDF-EOS 4	SD

#### 9.6.4.3 MIRS Swath Data Fields and Attributes

Tables 9.6.4.3-1 and 9.6.4.3-2 list the attributes and Tables 9.6.4.3-3 and 9.6.4.3-4 list the retrieved products in the HDF\_EOS data files that will be archived at CLASS in the first phase.

<b>Table 9.6.4.3-1. MIRS HDF-EOS Sounding Swath Attributes</b>		
<b>Parameter Name</b>	<b>Data Type</b>	<b>Explanation</b>
Temp_Limits	R*4	Lower and upper limits of temperatures (K)
PTemp_SCAL	R*4	Scaling factor of layer temperature
PLayer_SCAL	R*4	Scaling factor for layer pressure
PVapor_SCAL	R*4	Scaling factor of layer water vapor amount
PCloud_SCAL	R*4	Scaling factor of cloud amount
PRain_SCAL	R*4	Scaling factor of rain amount
PSnow_SCAL	R*4	Scaling factor of snow amount
Pice_SCAL	R*4	Scaling factor of ice amount
PGrpl_SCAL	R*4	Scaling factor of graupel amount
SurfP_SCAL	R*4	Scaling factor of surface pressure
Level_pres	R*4 (1:101)	Pressures of the levels between the products profile layers
Total_scan	I*2	Total number of scans in the data
Num_fov	I*2	Number of FOVs in the orbit data
Num_layer	I*2	Number of layers for profiles
Num_qcatm	I*2	Number of atmosphere QC parameters
Num_qcsfc	I*2	Number of surface QC parameters

<b>Table 9.6.4.3-2. MIRS HDF-EOS Sounding Swath Data Fields</b>				
<b>Parameter Name</b>	<b>Data Type and Dimension</b>	<b>Missing Data Value</b>	<b>Scale</b>	<b>Explanation</b>
ScanTime_year	I*2 (1)	-999	1	Four digit calendar year (e.g., 1999)
ScanTime_doy	I*2 (1)	-999	1	Day of year (e.g., 1-366)
Latitude	R*4 (2)	-999	1	Latitude (degrees, e.g., -90 to 90)
Longitude	R*4 (2)	-999	1	Longitude (degrees, e.g., -180 to 180)
TimeUTC	R*8 (1)	-999	1	Number of seconds and fractions since 0000 UTC Jan. 1, 1993 (TAI93)
Atm_type	I*2 (2)	-999	1	Atmosphere type: 1=global
Sfc_type	I*2 (2)	-999	1	Surface Type: 0=ocean, 1=sea-ice, 2=land and 3 =snow cover.

Qc_atm	I*2 (2)	-999	1	Quality flag for retrievals: 0=retrieval; 1=no retrieval (default to background value).
Qc_sfc	I*2 (2)	-999	1	Quality flag for retrievals: 0=retrieval; 1=no retrieval (default to background value).
Chisqr	R*4 (2)	-999	1	Convergence rate: good retrievals with Chisqr <= 3; less reliable retrievals with 3< Chisqr <=10; unreliable retrieval with Chisqr > 10.
Orbit_mode	I*2 (1)	-999	1	Orbit direction: 0=ascending; 1=descending.
LZ_angle	R*4 (2)	-999	1	Local zenith angle range (degrees) Ranges from -59 to 59
PLayer	R*4(1)	N/A	1	Pressure of profile products layers in mbar
PTemp	R*4 (3)	bkv	1	Temperature profiles containing layer temperature in Kelvin
PVapor	R*4 (3)	bkv	1	Water Vapor profiles containing mixing ratio of absorbents for each layer in g/kg
PClw**	R*4 (3)	bkv	1	Cloud profiles containing mixing ratio of cloud particles for each layer in g/kg.
PRain**	R*4 (3)	bkv	1	Cloud profiles containing mixing ratio of rain particles for each layer in g/kg.
PGraupel**	R*4 (3)	bkv	1	Cloud profiles containing: mixing ratio of graupel particles for each layer in g/kg.
PSnow**	R*4 (3)	bkv	1	Cloud profiles containing: mixing ratio of snow particles for each layer in g/kg.
PIce**	R*4 (3)	bkv	1	Cloud profiles containing: mixing ratio of ice particles for each layer in g/kg.
SurfP***	I*2(2)	bkv	10	Surface Pressure in mbar
Note 1 : For Dimensions 1 : scan (retrieval layers for Player) ; 2: scan*spot ; 3: scan*spot*layer

Flag Value      Explanation

-999              Missing product

-888              Operational products not available

bkv                Background values used when no retrievals available

\*\* : The arrays are only place holders at the Version 1, and the actual values will be filled in and available to users following the MIRS operational delivery timeline. Some of them will be only available as experimental products. Operational products can be referred to MIRS deliverables in

9.6.4.4 Data Access

The MIRS data sets are able to be accessed via class. The URLs to access the data are listed below:

<http://www.class.noaa.gov>

<http://www.class.ncdc.noaa.gov>

<http://www.class.ngdc.noaa.gov>

## 9.7 OZONE PRODUCTS

This section describes in detail the three operational ozone products based on the data collected from the SBUV/2 instrument. The three products are:

- o 1b Data Set
- o Product Master File - Original Format and BUFR Format

### 9.7.1 1b DATA SET

The 1b dataset is an operational product of the SBUV/2 instrument and should not be confused with the Level 1b database described in Section 8. (The SBUV/2 1b dataset does not meet the Level 1b definition.)

#### 9.7.1.1 Overview

The 1b data set contains:

- (1) All SBUV/2 sensor data (except boost mode data [first several minutes after launch]; data with unreasonable year, day or time of day; and data within an orbit that is not time ascending) and support data necessary for the derivation of atmospheric ozone and solar flux;
- (2) Instrument in-flight calibration data and housekeeping functions for monitoring post-launch instrument changes; and
- (3) Prelaunch calibration factors, computed current-day instrument calibration and albedo correction factors to adjust the ozone algorithm for actual instrument performance. Initially, only prelaunch calibration adjustments will be made until the Instrument Support Subsystem is implemented.

The SBUV/2 sensor data consists of radiance and irradiance measurements taken in both the discrete mode (12 wavelengths) and the sweepmode (1680 wavelengths) at approximately 2 Angstrom ( $\Delta$ ) intervals. The support data includes earth location data derived from predictive ephemeris, cloud and temperature from TOVS, ancillary data to initialize the algorithm, surface pressure data, and (to be added at a later date) snow/ice data.

#### 9.7.1.2 Contents

The following subsections describe the contents of the 1b data set:

- Raw SBUV/2 data
- Cloud and temperature data from TOVS
- Surface pressure data
- Ancillary data set

- Instrument calibration and albedo correction data
- Instrument status and quality flags
- Earth location data
- Fill values on the 1b data set

#### 9.7.1.2.1 Raw SBUV/2 Data

Each major frame (32 seconds) of raw SBUV/2 data received from the satellite results in one discrete or two sweep data records on the 1b data set. Each discrete data record contains SBUV/2 instrument data collected from 12 discrete wavelengths by the monochromator (one wavelength if it is in the position mode) and one wavelength by the CCR plus electronic calibration data. The instrument may be in discrete, sweep, position, wavelength calibration or diffuser decontamination mode and viewing either the Earth, wavelength calibration lamp or diffuser plate. Each sweep data record contains SBUV/2 instrument data collected in the instrument sweep mode. In this mode the instrument will usually be viewing the diffuser plate in order to take solar measurements, however other viewing scenes are possible. For a complete set of 1680 wavelength measurements, twelve 16 second sweep data records are required. These correspond to six 32 second major frames.

All SBUV/2 data are preserved as raw counts on the 1b data set. The only conversions to engineering units are done for the orbital and daily statistics.

The data on the 1b data set are arranged in terms of SBUV/2 orbits. The SBUV/2 orbit definition is different from the standard TIROS-N series (NOAA/NESDIS) orbit definition. Each SBUV/2 orbit begins when the center of the SBUV/2 instrument field of view (FOV) transits the equator on the dark viewing side of the Earth and continues through one satellite revolution about the Earth. Earth location data is used to ascertain equator crossing but is only given for the start time of each TIP major frame's worth of data. Thus, the SBUV/2 orbital designation of each TIP major frame's worth of information is based on the earth location at the start of each major frame.

The orbit definition used on the TIROS-N series satellite has the orbital boundary occurring at northbound equator crossing regardless of the time the satellite views the Earth. By this definition an afternoon satellite's (northbound equator crossing on the sunlit side of the Earth) orbits begin during daylight viewing times (i.e. about 50 minutes out of phase with SBUV/2 orbits). SBUV/2 will fly only on afternoon satellites. The change in the orbit definition is to provide continuity with that used for Nimbus-7 SBUV.

#### 9.7.1.2.2 Major Frame Synchronization

Each major frame contains 32 channels, or groups of 10 minor frames, with each channel containing one second's worth of data. Some of the data stored in a particular channel is data that was actually sampled during the previous second and thus belongs to the previous channel. Data items belonging to the previous channel are synchronized (placed in the proper channel)

before being written to the daily 1b data set on either discrete sweep data records. This means that some of the data arriving in the first channel of a given major frame is placed in the last channel of the previous major frame before being processed.

The following items need synchronization.

- Grating position
- CCR and PMT data
- Status Word 1 of Digital A data - all items
- Status Word 2 of Digital A data - all items

#### 9.7.1.2.3 Cloud and Temperature Data from TOVS

Meteorological data is provided to the SBUV/2 Data Set from the TIROS Operational Vertical Sounder (TOVS) carried aboard the same satellite as the SBUV/2 instrument. When available, the total ozone algorithm uses cloud information to estimate the ozone hidden from the satellite sensor below the clouds. The TOVS utilizes three instruments for the satellites prior to NOAA-K:

- 1) A High Resolution Infrared Radiometric Sounder (HIRS/2),
- 2) A Microwave Sounding Unit (MSU), and
- 3) A Stratospheric Sounding Unit (SSU).

The TOVS products used by SBUV/2 are: cloud amounts, cloud top temperatures, and vertical profiles of atmospheric temperatures.

The vertical temperature profiles are given for up to forty specified pressure levels ranging from 1000 mb (or surface level) to 0.1 mb. These profiles represent one “box” in the current operational TOVS processing system (formerly a “box” in the old TOVS processing system). A “minibox” consists of 63 HIRS/2 fields of view (called spots) from 7 HIRS/2 scan lines (a “box” consisted of 9 spots from 3 scan lines). Certain quality checks are made during TOVS processing to assure the reasonableness of the temperature profiles. If any of these checks indicate a bad sounding, or the data is unavailable the profile is rejected during the SBUV/2 processing and replaced with fill values.

Cloud amounts and cloud top temperatures are provided on a spot by spot basis. The current operational TOVS processing system provides SBUV/2 with cloud data for boxes which are adjacent to nadir. Miniboxes are constructed by selection of the appropriate spots in a box. Cloud top pressures (analogous to cloud top height) are computed for each spot by linear interpolation of the cloud top temperature between adjacent levels in the temperature profile.

Averages of cloud amount, cloud top temperature, and atmospheric temperature profiles are computed to represent the area sampled by those SBUV/2 fields of view (the four longest wavelengths fields of view in the discrete mode) used in the total ozone computation. This area

is equivalent to 30 HIRS/2 spots. Cloud averages are computed using all spots (except fills) lying within the composite SBUV/2 field of view area. Temperature profile averages include only those from miniboxes with two or three HIRS/2 scan lines lying within this composite SBUV/2 field of view area.

Temperatures of 20 pressure levels (more than needed by the ozone algorithms) have been saved on the 1b Data Set for future implementation of temperature dependency of the ozone absorption coefficients.

Meteorological data is collected only when the instrument is in the discrete mode (normal mode for ozone determination), the position mode (rarely if ever used), and wavelength calibration mode. These three modes have in common the same record format, i.e. the discrete data record. As the ancillary data is not time dependent, this data will be written once for each Daily 1b data set. It is not saved for sweep mode data.

#### 9.7.1.2.4 Surface Pressure Data

The source of this data is the same as that used for Nimbus SBUV processing. It was originally derived from a terrain height data set obtained from NOAA. Terrain heights in kilometers (km) were converted to millibars (mb) using the following equation:

$$P = 1013.25(1 - 0.0257H)^{5.256}$$

where H is the terrain height in km.

The entire globe is divided into 2.5 x 2.5 degree latitude and longitude cells with terrain pressure given for each cell. A total of 10,585 values are given. A two-dimensional interpolation procedure using the four closest grid points is used to find the value of terrain pressure at the start of each major frame. Surface pressure is supplied for discrete mode data only.

#### 9.7.1.2.5 Ancillary Data

The Ancillary Data Set contains the thirteen SBUV/2 bandcenter wavelengths, their associated ozone absorption and Rayleigh scattering coefficients, total ozone and multiple scattering correction lookup tables, and the a priori profiling information. This is the data required to initialize the ozone algorithm.

The Multiple Scattering Coefficients data records contain 1700 values (10 solar zenith Angles, 23 standard ozone profiles, five wavelengths and two surface pressures) of Log Q, 1700 values of Log Q (single scattered), 1700 values of reflected fraction and 170 values (for 23 standard ozone profiles, five wavelengths and two surface pressures) of atmospheric-surface backscatter fraction). The Total Ozone Tables data records contain 1700 values of Log I<sub>o</sub>, 1700 values of

reflected fraction, and 170 values of atmospheric-surface backscatter fraction. The A-Priori Profile Information data records will contain 180 values of a priori profile coefficients and 144 values for the a priori covariance matrix elements.

As the ancillary data is not time dependent, this data will be written one for each Daily 1b Data set.

#### 9.7.1.2.6 Instrument Calibration and Albedo Correction Data

The Instrument Calibration and Albedo Correction Data contains four sets of values:

- i) Prelaunch radiance and irradiance calibrations
- ii) Day 1 solar irradiance calibrations
- iii) Monochromator interranging ratios
- iv) Albedo Correction Factors

Initially, only prelaunch radiance and irradiance calibrations will be on the 1b Data Set until the Instrument Support Subsystem is implemented. Three sets of prelaunch calibration values are required:

- i) Radiance calibrations - count to  $W/cm^3$  conversion constants
- ii) Irradiance calibrations - count to  $W/cm^3/sr$  conversion constants
- iii) Prelaunch diffuser check flux ratios

The radiance and irradiance calibrations each consist of 37 constants: one value for the CCR at 3786.2 Å and 12 values for each of the three monochromator gain ranges at the 12 discrete wavelengths. The ratios of the radiance and irradiance calibrations are used in the computation of I/F ratios in the ozone computation. The prelaunch flux ratios will be used to perform the diffuser calibration in the instrument support subsystem. There will be one ratio for each mercury line chosen which is to be specified.

The monochromator interranging ratios and albedo correction factors are derived from the previous N (to be specified) day's instrument outputs for the current day 1b and ozone processing. There are two interranging ratios for the monochromator, one between gain ranges 1 and 2 (IRR<sub>21</sub>) and one between gain ranges 2 and 3 (IRR<sub>32</sub>).

The albedo corrections account for solar flux and instrument changes and are used to adjust the I/F ratios in the ozone processing; there are 13 values for a day, one for the CCR wavelength (3786.2 Å) and twelve for the monochromator discrete wavelengths.

#### 9.7.1.2.7 Instrument Status and Quality Flags

The 1b Data Set contains a comprehensive set of flags that provide instrument status and data quality information. Table 9.7.1.2.7-1 summarizes the types of flags, where in the processing

system they are set and what ranges of data they cover. The flags are defined in the Data Dictionary (Section 9.7.4).

<b>Table 9.7.1.2.7-1. 1b Data Set Instrument Status and Data Quality Flags.</b>		
<b>Data Quality Flags</b>	<b>Where Set*</b>	<b>Data Range Covered</b>
Minor Frame Quality Flags	Decommutation	Channel
Major Frame Quality Flags	Raw TIP/ Decommutation Immediate	Major Frame
Final Channel Quality Flags	1b	Channel
Channel Fill Flags	1b	Channel
Channel Error Flags	1b	Channel
Sample Status Flags	1b	1 discrete sample 10 sweep samples
<b>Summary Status Flags</b>		
Summary Grating Mode	1b	Major Frame**
Summary Grating Memory Mode	1b	Major Frame**
Scene Mode	1b	Major Frame**
Instrument Data Quality Flag	1b	Major Frame**
Channel=10 minor frames=1 second		
Major frame=320 minor frames=32 seconds		
Discrete sample=2 second interval		
10 Sweep samples=1 second interval		
*Refer to Section 1.5 for a discussion of the step for the Operational Ozone Product System **Based on major frames where ECAL/Retrace is off.		

#### 9.7.1.2.8 Earth Location Data

For the start time of each TIP Major Frame (every 32 seconds), using as input the ephemeris (i.e. spacecraft position and velocity vectors) data from GTDS, the following earth location parameters are derived.

- Subsatellite Latitude
- Subsatellite Longitude
- FOV Latitude
- FOV Longitude
- Solar Zenith Angle at FOV
- Solar Azimuth Angle at FOV
- Solar Right Ascension
- Solar Declination
- Spacecraft-centered Solar Elevation Angle
- Spacecraft-centered Solar Azimuth Angle
- Altitude of Satellite

#### 9.7.1.2.9 Fill Values on the 1b Data Set

A fill value may be inserted into an individual data item on the 1b Data Set to indicate that the original data in the input data stream was missing. The Daily Headers and Ancillary Data contain no fill values. The only record types which contain fill values in the Daily Data Records files of the 1b Data Set are the Discrete and Sweep Data Records. Fill values for data items or groups of data items are given in Table 9.7.1.2.9-1.

<b>Table 9.7.1.2.9-1. Fill Values on Data Records.</b>		
<b>Data Items or Group of Data Items</b>	<b>Fill Values</b>	<b>Comment</b>
Attitude Data	-32,767 (Hex Code 8001)	Reason for fill given by Major Frame Quality Dwell Mode, Data Fill or Missing Attitude Flags
Earth Location Data	-32,767	Reason for fill is no Earth Location Data Found by Decommuation Program (Indicated by Major Frame Quality Flag For No Earth Location Data)

Digital B Telemetry & Data and Analog	All Bits set to 1	Reason for fill given in this frame's and possibly next frame's Major Frame Quality Flag: Dwell Mode, or Data Fill Flags
Digital A Instrument Data except Recommended Monochromator Range I. D.		Reason for fill given by Major Frame Quality Flags: Data Fill Flags
Meteorological and Geographical Support Data except for FOV Snow/Ice Flag, Cloud Amount/Cloud Albedo and Cloud Amount for Spots 1-9	-7777	Cloud top pressure set to -7777 when no clouds present in 8 second SBUV/2 FOV (i.e. cloud amount = 0)
Cloud Amount/Cloud Albedo	-1028	
Cloud Amount for Spots 1-9	-8	
FOV Snow/Ice Flag Digital A	-1	
Digital A Analog Housekeeping Data	All bits set to 1	Reason for fill given by Major Frame Quality Flags: Dwell Mode or Data Fill Flags
Total Ozone and Profile	-77.0	Reason given by corresponding Ozone Data Error Flag
Note: this table includes some data items not found in the 1b Data Set.		

### 9.7.1.3 Data Organization

Each 1b Data Set consists of a file containing a calendar month of data. A data set standard header (the OOPS Standard Header Records for the monthly product) describes the data contained on the tape. This is followed by a series of Daily 1b Data Sets, one for each day of the month. Once a calendar month is completed, the complete monthly data set is made available to CLASS on the second day of the following month.

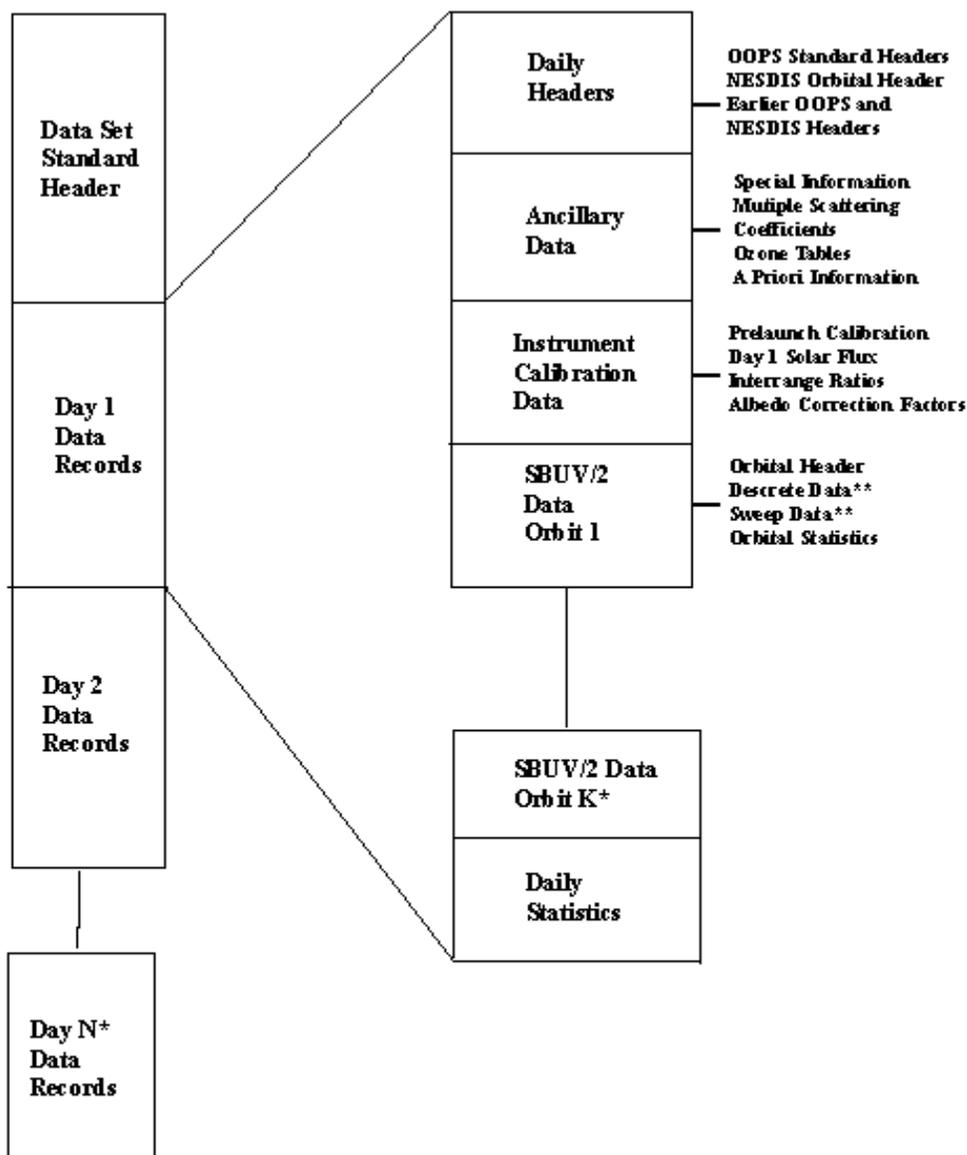

Each Daily 1b Data Set as described in Table 9.7.1.3-1 begins with OOPS Standard Header Records that describe the current day's data set and all the input data sets used to create it. This includes the ancillary data, the instrument calibration and albedo correction data, each SBUV/2 orbit in the correct day, and the daily statistical summary. All data for an orbit that begins the current day is included in the current day. The contents of these data files are described in Section 9.7.1.4. The organization of the Daily 1b Data Set header records is described in Table

9.7.1.4-1. A schematic overview of the 1b Data Set is shown in Figure 9.7.1.3-1. Data is in time ascending order.

The 1b Data Set has a logical record length (LRECL) of 720 bytes and a physical blocksize (BLKSIZE) of 25,920 bytes (36 logical records/block).

<b>Table 9.7.1.3-1. Daily 1b Standard Header Record Data Set Order.</b>

#### 9.7.1.4 Record Layouts

The following pages describe the layout of each record in the 1b Data Set. The OOPS Standard Header record is shown in Section 9.7.3. Individual data items are described in the Data Dictionary (Section 9.7.4). Records appear on the 1b Data Set in the order shown below:

<b>Table 9.7.1.4-0. List of Tables in 1b Data Set</b>		
<b>Standard Record Layout</b>		
9.7.1.3-1	Data Set Standard Header	2/ Data Set (Month)
<b>Daily Headers</b>		
9.7.3-1 and 9.7.3-2	OOPS Standard Header Records NESDIS Orbital Header Records	32/Day Variable
<b>Ancillary Data</b>		
9.7.1.4-3	Spectral Information Data Record (DR)	1/Day
9.7.1.4-4	Multiple Scattering Coefficients DR	40/Day
9.7.1.4-5	Total Ozone Tables DR	33/Day
9.7.1.4-6	A Priori Information DR	2/Day
<b>Calibration Data</b>		
9.7.1.4-7	Prelaunch Calibration DR	1/Day
9.7.1.4-8	Day 1 Solar Flux DR	1/Day
9.7.1.4-9	Interrange Ratios DR	1/Day
9.7.1.4-10	Albedo Correction Factor DR	1/Day
<b>SBUV/2 Data</b>		
9.7.1.4-11	SBUV/2 Orbital Header Record	1/Orbit
9.7.1.4-12	Discrete DR	Variable
9.7.1.4-13	Sweep DR	Variable
9.7.1.4-19	SBUV/2 Orbital Statistical Record	1/Orbit
9.7.1.4-20	Daily SBUV/2 Statistical Record	1/Day

Except where noted in the record layouts, data is stored in signed full word integer (I\*4), signed half-word integer (I\*2), or unsigned individual byte integers (all 8 bits are used in computing the integer value). All data are stored in UNIX IEEE data type conventions. For flag fields consisting of several individual bit flags, a byte/bit breakdown is included following the record format.

Table 9.7.1.4-1 contains a list of each record type found in the 1b Data Set. Figure 9.7.1.4-1 shows the layout of the 1b Data Set Record.

<b>Figure 9.7.1.4-1. SBUV 1b Data Set Record IDs.</b>	
<b>Record ID</b>	<b>Record Description</b>
<b>Data Set Headers</b>	
241	OOPS Standard Header Record I
242	OOPS Standard Header Record II
250	NESDIS Orbital Header Record

485	Total Ozone Tables Data Record
495	A Priori Information Data Record
<b>Instrument Calibration Data</b>	
525	Prelaunch Calibration Data Record
565	Day 1 Solar Flux Data Record
575	Interrange Ratios Data Record
585	Albedo Correction Factor Data Record
<b>SBUV/2 Data</b>	
651	SBUV/2 Orbital Header Record
661	Discrete Mode Data Record (Discrete Record Format)

662	Wavelength Calibration Mode Data Record (Discrete Record Format)
663	Position Mode Data Record (Discrete Record Format)
664	Diffuser Decontamination Data Record
671	Sweep Mode Data Record (Sweep record Format)
681	Conflicting Modes* Record (Discrete Record Format)
682	Conflicting Modes* Record (Sweep Record Format)
691	SBUV/2 Orbital Statistical Record
695	Daily SBUV/2 Statistical Record

**Note:**

The data format (discrete or sweep) and grating mode (discrete, sweep, wavelength calibration, position, or diffuser decontamination) of a Discrete or Sweep Data Record are determined from each of the 32 channels of the corresponding Major Frame Data Record. If any channel data of a Major Frame Record indicates a record format or grating mode that is different from previous channel data within that major frame, the corresponding Discrete or Sweep Data Record is labeled as an Inconsistent Discrete or Inconsistent Sweep Data Record. If the data format is inconsistent the record is written as an Inconsistent Sweep data Record, regardless of whether or not the grating mode is inconsistent. If only the grating mode is inconsistent, the record is written as an Inconsistent Discrete Data Record if the record format is discrete and as an Inconsistent Sweep Data Record if the record format is sweep.

#### 9.7.1.5 Housekeeping Data Ranges and Conversions

The SBUV/2 instrument provides a variety of housekeeping data to monitor the health of the instrument itself. These data are contained in the Digital A Subcom Analog Housekeeping and the Analog Telemetry. On the 1b Data Set these data are stored in the individual data records as raw counts. However, in the orbital and daily statistics records these data have been converted to

engineering units. For discrete data, there are two sets (of 16 seconds each) of Digital A (Subcom) Analog Housekeeping data and two sets of Analog Housekeeping data for each major frame (one record). For sweep data, where one major frame requires 2 data records, both Digital A Subcom and Analog Telemetry data are present for each 16 second interval (i.e. each data record).

Tables 9.7.1.5-1 and 9.7.1.5-2 on the following pages contain the housekeeping data ranges, counts to engineering units conversion methods and, for orbital and daily statistics, the scaling factors of the stored data (e.g., a stored value of 4316 with a scaling factor of  $10^2$  is really 43.16). The source of this information is the TIROS-N Unique Instrument Interface for SBUV/2. Data ranges are not used in computing orbital and daily statistics (i.e. no data are excluded).

Three conversion methods are used to go from raw counts to Engineering Units (E.U.), depending on the type of housekeeping data:

1. Linear interpolation

$$E.U. = (A \times counts) + B$$

where A and B are given in Table 9.7.1.5-1 or 9.7.1.5-2.

2. SPTEMP: Convert single point temperature to degrees Centigrade using cubic spline interpolation.
  - a. Convert count to voltage in volts.
  - b. Select appropriate temperature-voltage curve for interpolation
  - c. Select closest four points on given curve for interpolation
  - d. Perform cubic spline interpolation/extrapolation
3. DFTEMP: convert differential count to differential temperature.
  - a. Compute Thermistor A count from differential count and reference count
  - b. Obtain Thermistor A temperature in degrees Centigrade (use SPTEMP)
  - c. Compute differential temperature from Thermistor A temperature and reference temperature.

## 9.7.2 PRODUCT MASTER FILE

### 9.7.2.1 Overview

The Product Master File (PMF) contains the ozone information derived by the ozone algorithm, located in space and time, other meteorological information developed in support of the ozone computation, parameters indicating the validity of the individual ozone retrievals and the radiance information derived from the SBUV/2 measurements.

#### 9.7.2.2 Data Organization

The operational monthly PMF contains one month of data comprised of whole orbits (delimited by night time equator crossing). The last orbit in the file may contain some data from the next day. The information on the file is grouped logically by orbit and by scan. Header and summary information is provided for each orbital group of scan by scan ozone data as well as daily summary information. The orbital group contains the OOPS Standard Header, ancillary data and instrument calibration data.

Figure 9.7.2.2-1 and Table 9.7.2.2-1 provide detailed descriptions of the arrangement of records on the PMF monthly operational file. Each daily record consists of the OOPS standard headers and the daily PMF records. The daily group indicated in the table is repeated for each day of the month. The file has a Logical Record Length (LRECL) of 828 bytes and is blocked at 16560 bytes (20 records). The SBUV/2 algorithm used prior to 2007 was called Version 6. Beginning in 2007, a revised SBUV/2 algorithm was implemented, called Version 8. For a detailed description of the Version 8 algorithm, refer to the Algorithm Theoretical Basis Document located at [ftp://www.orbit.nesdis.noaa.gov/pub/smcd/spb/ozone/docs/SBUV2\\_V8\\_ATBD\\_020207.pdf](ftp://www.orbit.nesdis.noaa.gov/pub/smcd/spb/ozone/docs/SBUV2_V8_ATBD_020207.pdf). At that time, the Version 6 monthly PMF file described here became solely an intermediate file, not for distribution. Users were provided only with daily PMFs. The format for Version 8 daily files is shown in Table 9.7.2.2-9 through 9.7.2.2-12. Since the Version 6 product is an intermediate step in the production of the Version 8 product, users can note the full original Version 6 data record is reproduced at the end of the Version 8 records, in words 1794-2000.

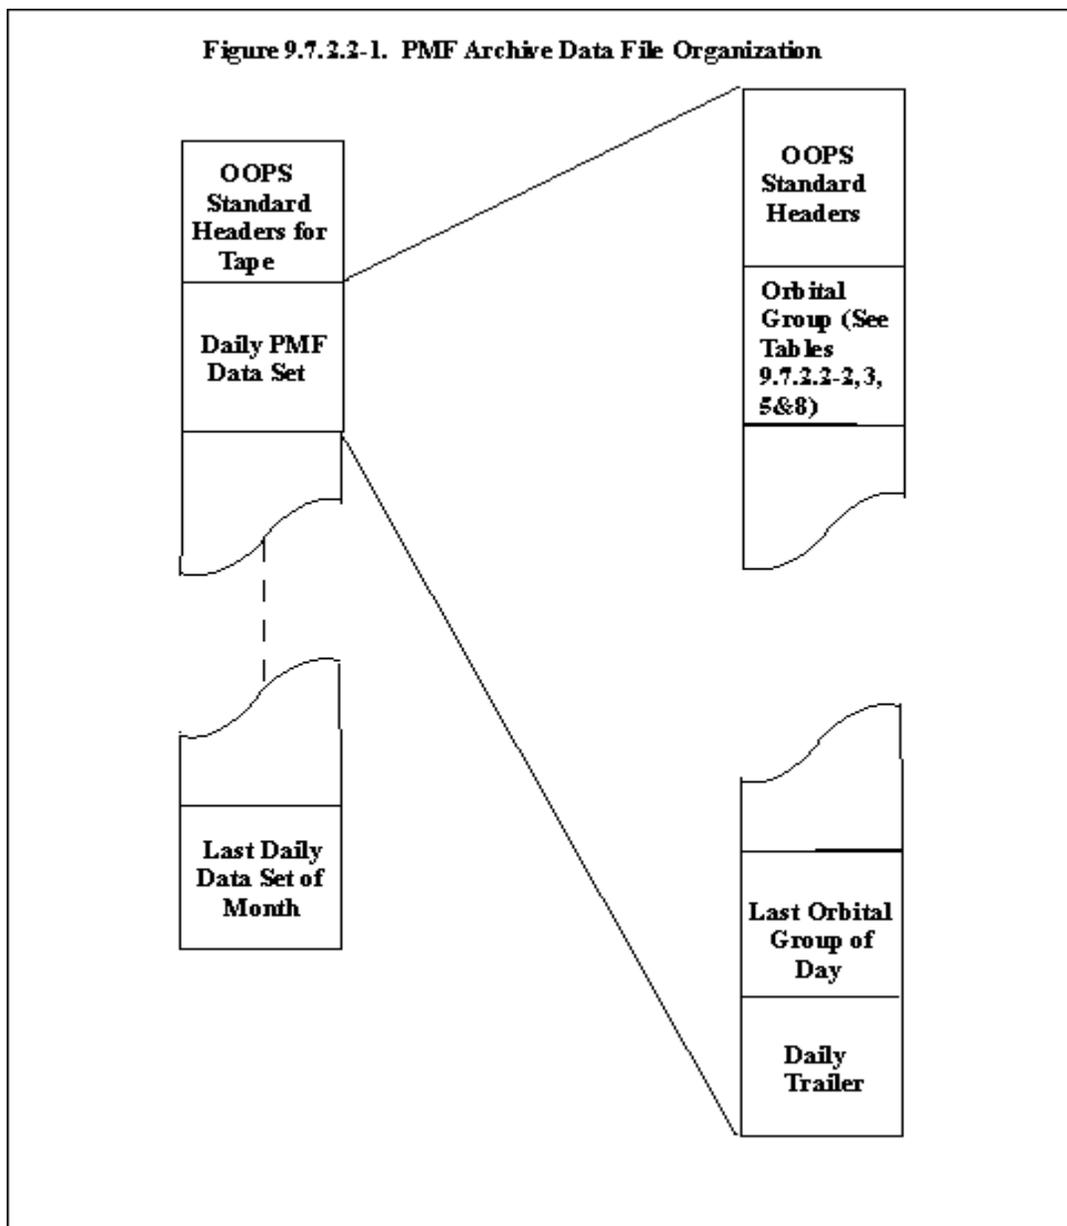

The archive original PMF (Version 6, available for years prior to 2007), available through CLASS, consists of daily files with only PMF data records (see Table 9.7.2.2-5). All other record types have been removed. The daily files are tarred together at the end of the month and available through CLASS on the second day of the next month. For Version 8, the archive format is exactly like the daily operational binary file format. Each daily file has two header records (Tables 9.7.2.2-9 and 9.7.2.2-10), followed by a variable number of data records (Table 9.7.2.2-11), ending with a trailer record (Table 9.7.2.2-12).

Table 9.7.2.2-2 and Table 9.7.2.2-3 lists the pressure layers and levels at which the ozone data is reported. With Version 8, there are 21 layers, instead of 12. In atmospheres, the Layer bottoms are: 1.0, 0.631, 0.398, 0.251, 0.158, 0.100, 0.0631, 0.040, 0.0251, 0.0158, 0.0100, 0.0063, 0.0040, 0.00251, 0.00158, 0.0010, 0.00063, 0.00040, 0.00025, 0.000158, and 0.0001, with top layer extending to infinity.

The PMF is also available in BUFR format (a WMO International format for observed data.).

See Table 9.7.2.2-8 for the PMF BUFR words (Version 6) and Table 9.7.2.2-13 for Version 8. Not all words are included in the Version 8 BUFR files. Including only a subset of words, with modified units, allowed the product to be created in a World Meteorological Organization (WMO) compatible format. Reading the BUFR files requires an input BUFR table that describes the layout of the BUFR subsets. These subsets are combined into BUFR messages of up to 10,000 bytes. Table 9.7.2.2-13 contains the BUFR input table, made up of three sections: Table A, Table B, and Table D.

<b>Table 9.7.2.2-1. PMF Record Layout for Day. (Version 6)</b>

.	<b>Byte 1</b>	<b>Byte 2</b>	<b>Byte 3</b>	<b>Byte 4</b>
<b>Word</b>	<b>Description</b>			
1	Record ID (Integer)			
2	Logical sequence number (1)			
3	SBUV/2 orbit number			
4-7	Date of job run (EBCDIC)			
8	Julian day of first good scan			
9	Seconds of day of first good scan (seconds)			
10	Year of first good scan (yyy)			
11	Subsatellite latitude of first good scan (degrees)			
12	Subsatellite longitude of first good scan (degrees)			
13	Spare (-77.0)			
14-16	Processing parameters			
17	Spare (-77.0)			
18-30	Day 1 solar irradiance			
31-67	Radiance calibration factors			
68-80	Band center wavelengths			
81-93	Effective ozone absorption coefficients			
94-106	Rayleigh scattering coefficient			
107-126	Processing options 0.0 = false, 1.0 = true			
127-207	Spare (-77.0)			

<b>Table 9.7.2.2-5. PMF Data Record. (Version 6)</b>				
	<b>Byte 1</b>	<b>Byte 2</b>	<b>Byte 3</b>	<b>Byte 4</b>
<b>Word</b>	<b>Description</b>			
1	Record ID (integer)			
2	Logical Sequence Number			
3	SBUV/2 Orbit Number			
4	Year at Start of Scan x 1000 + Day of Year at Start of Scan			
5	Seconds of Day			
6	Subsatellite Latitude at the Beginning of Scan (Degrees)			
7	Subsatellite Longitude at the Beginning of Scan (Degrees)			
<b>Total - Ozone Output</b>				
8	View Latitude - Average for Total Ozone Wavelengths (Degrees)			
9	View Longitude - Average for Total Ozone Wavelengths (Degrees)			
10	Solar Zenith Angle - Average for Total Ozone Wavelengths (Degrees)			
11-14	N-Values (CCR Coincident with 339.8, 331.2, 317.5, 312.5 nm)			
15-18	N-Values (Monochromator 339.8, 331.2, 317.5, 312.5, 305 nm)			
19	Gain Selection code for each of five wavelengths (339.8, 331.2, 317.5, 312.5, 305 nm) (Ex: Integer #33322)			
20	Grating Position Error Offsets for wavelength's 1-6.			
21	Total Ozone - Best Estimate based on TOVS Cloud Height. (m-atm-cm)			
22	FOV Average Cloud Top Pressure (atm) (Reported by TOVS)			
23	Pressure of Reflective Surface (atm) (Estimated using TOVS)			
24	Reflectivity-Average (Estimated using TOVS)			
25	Percent Cloud from CCR			
26	Ozone Error Flag for TOVS Total Ozone			
27	Total A-Pair Ozone (m-atm-cm)			

28	Ozone A-Pair sensitivity (N-Value/m-atm-cm)
29	Reflectivity average for A-Pair
30	Ozone Weight A-Pair
31	Total Ozone B-Pair (m-atm-cm)
32	Ozone Sensitivity B-Pair (N-Value/m-atm-cm)
33	Reflectivity average for B-Pair
34	Ozone Weight B-Pair
35	Total Ozone-Best Estimate Based on Climatological Cloud Height (m-atm-cm)
36	Total Ozone C-Pair (m-atm-cm)
37	Pressure of reflecting Surface (Estimated Without TOVS) (atm)
38	Reflectivity Average
39	Ozone Sensitivity C-Pair (N-Value/m-atm-cm)
40	Ozone Error Flag for Best Ozone
41	FOV Snow Flag * 10 + Table Selection Index 1=Snow      1 = Low Latitude; 0=No Snow    2 = Mid Latitude; -1=No Info.    3 = High Latitude.
42	Grating Position Error Offset for wavelength's 7-12
43	Reflectivity difference (Photometer/monochromator)
44	Terrain Surface Pressure (atm)
45	Total Ozone D-Pair (m-atm-cm)
46	SOI Index
47	Total Ozone B'-Pair (m-atm-cm)
<b>Profile Output</b>	
48	View latitude - Average for profile (degrees)
49	View longitude - Average for profile (degrees)
50	Solar Zenith Angle - Average for profile (degrees)

51-58	N-Values (CCR coincident with Profile wavelengths 252.2, 275.3, 283.0, 287.6, 292.2, 297.5, 301.9, and 305.8 nm)
59-66	N-Values (monochromator profile wavelengths)
67-68	Gain Selection Flags for Each of Eight Wavelengths
69-80	Layer Ozone-first Guess Amounts in 12 Pressure Layers (m-atm-cm)
81	Total Ozone for A Priori profile (m-atm-cm)
82-91	Q-Values Corrected for Multiple Scattering and Surface Reflectivity (252.2 through 317.5 nm)
92-101	Initial Residues (252.2 through 317.5 nm) (%)
102-106	Multiple-Scattering correction to Q for Five Longer Wavelengths Channels (297.5 through 317.5 nm)
107-111	Reflectivities for Five Longer Wavelengths (297.5 through 317.5 nm)
112-116	Multiple-Scattering Sensitivity for Five Longer Wavelengths (297.5 through 317.5 nm) (Q-Value/m-atm-cm)
117-121	Multiple-Scattering Mixing Fraction for Five Longer Wavelengths (297.5 through 317.5 nm)
122-131	Final Residues (252.2 through 317.5 nm) (%)
132-143	Layer Ozone Amounts for Solution Profile in 12 Pressure Layers (m-atm-cm)
144-155	Layer Ozone Standard Deviations for Solution Profile in 12 Pressure Layers (%)
156	Total Ozone for solution profile (m-atm-cm)
157	Ozone Error Flag for Profile
158-159	Upper Level Profile parameters C (m-atm-cm) and Sigma
160-178	Ozone Mixing Ratio at 19 Pressure Levels (micro gm/gm)
179-190	Layer Ozone Standard Deviations for First Guess in 12 Pressure Layers (%)
191-200	Standard Deviations of Q-Values Corrected for Multiple Scattering and Reflectivity (252.2 through 317.5 nm) (%)
201	Number of Iterations for Profile Solution
202	VCI (Volcano Contamination Index)

203	Spare (-77.0) or Solar Azimuth Angle at Field of View at start of scan (degrees)
204	Ozone Sensitivity D-Pair (N_value/m-atm-cm)
205	Ozone Sensitivity B'-Pair (N_value/m-atm-cm)
206	Solar Zenith Angle at Start of Scan (Radians x 10 <sup>4</sup> )
207	Solar Zenith Angle at End of Scan (Radians x 10 <sup>4</sup> )

<b>Table 9.7.2.2-6. PMF Orbital Trailer Record. (Version 6)</b>				
	<b>Byte 1</b>	<b>Byte 2</b>	<b>Byte 3</b>	<b>Byte 4</b>
<b>Word</b>	<b>Description</b>

### 9.7.3 OOPS STANDARD HEADER

Each monthly and daily SBUV/2 product has a pair of standard header records at the beginning of the data set that describes the contents of that data set. The standard headers include information such as the range of data coverage and the version number of the data set (for those situations where the data is recreated, e.g., due to changes in instrument calibration).

The 1b data set also contains standard headers describing each input data set (e.g. meteorological) used to build the 1b. The Product Master File will have the 1b standard header records in addition to its own standard headers. Starting with Version 8 PMFs in 2007, the 1B datasets is the only externally distributed dataset that will contain the OOPS Standard Header Records.

The format of the OOPS standard header is given on the following pages. Definitions of individual items can be found in the Data Dictionary, Section 9.7.4.

<b>Table 9.7.3-1. OOPS Standard Header Record I.</b>				
	<b>Byte 1</b>	<b>Byte 2</b>	<b>Byte 3</b>	<b>Byte 4</b>
<b>Word</b>	<b>Description</b>			
1	Record ID		Integer number	
2-3	Spacecraft Name		'NOAA - xx'	
4-5	Instrument Name		'SBUV/2'	
6-9	Data Set name		16 character data set name	
10	Data Version Identifier		'VER'	
11-12	Data Version		'bbxxa'	
13	Data Generation Identifier		'GENb'	
14-15	Data Generation Date		('yybmmbdd')	
16-17	Data Generation Time		('hhmmssb')	
18-19	Program Identifier		('PROGRAM:')	
20-21	Program name		('aaaaaa')	
22	Program Version Identifier		('VER')	
23-24	Program Version		('bxx.xxbb')	

25-26	Program Version Date	('yy <b>b</b> mm <b>b</b> dd')
27-28	Spare	( 8 ASCII blanks)
29-30	Data Coverage identifier	('DATA:')
31-32	Data Start Date	('19yy <b>b</b> ddd')
33-34	Data Start Time	('`sss<m-kono@tv- <a href="mailto:m-kono@tv-asahi.co.jp">asahi.co.jp</a> > sss')
35	'To' Character	('`bTO <b>b</b> ')
36-37	Data End Date	('19yy <b>b</b> ddd')
38-39	Data End Time	('`ssss <b>b</b> ')
40	Standard/Non-standard Wavelength Flag	(4 ASCII blanks or 'STND' or 'SPEC')
41-180	Spares (ASCII blanks)	
<p>For Data Sets containing a time span of data (e.g. Daily 1b); Otherwise spare words (all ASCII blanks) <b>b</b> = blank, x = numeric character, a = alphabetic character.  Note: all words are ASCII characters except word 1.</p>		

<b>Table 9.7.3-2. OOPS Standard Header Record II.</b>				
	<b>Byte 1</b>	<b>Byte 2</b>	<b>Byte 3</b>	<b>Byte 4</b>
<b>Word</b>	<b>Description</b>			
1	Record ID			
2-40	Data or Program Version Change Description			
41-180	Spare (ASCII blanks)			
<b>Note:</b> all words are ASCII characters except word 1				

#### 9.7.4 DATA DICTIONARY

The data dictionary contains an entry for each lowest level data item, and in some cases, group items, found in each of the OOPS data sets. Where the same information occurs on more than

one data set, even if stored in different units (e.g., radians vs. degree), it has been given a common name and only occurs once in the data dictionary. Individual byte/bit breakdowns (e.g. series of 1 bit flags) of these items will not be listed as separate entries in the data dictionary.

The data set name abbreviations used in the data dictionary are given below for reference:

<b>Data Set</b>	<b>Abbreviation in Data Dictionary</b>
Product Master File	PMF
1b	1b

There the data set name given is All-OOPS which means that the associated data occurs on all four of the data products. These data items are part of the OOPS Standard Header (Section 9.7.4).

<b>Data Dictionary</b>																				
<b>Data Item</b>	<b>Data Sets</b>	<b>Description</b>																		
Analog Telemetry	1b	Seventeen SBUV/2 analog telemetry points, sampled at 16 second intervals. Analog telemetry data are found in word 13 of the TIP minor frames. For all but orbital and daily statistical records on the 1b data set, these data are given in terms of counts. On orbital and daily statistical records these are given in engineering units. For ranges and scaling factors see Section 9.7.1.5.																		
		<table border="1"> <thead> <tr> <th><b>No.</b></th> <th><b>Telemetry Point Name</b></th> </tr> </thead> <tbody> <tr> <td>1.</td> <td>SM Baseplate Temp. #2 (1)</td> </tr> <tr> <td>2.</td> <td>SM Shroud Temp.</td> </tr> <tr> <td>3.</td> <td>Depolarizer Housing Temp.</td> </tr> <tr> <td>4.</td> <td>HVPS Temp.</td> </tr> <tr> <td>5.</td> <td>Diffuser Plate Temp #2 (1)</td> </tr> <tr> <td>6.</td> <td>Chopper Motor Temp.</td> </tr> <tr> <td>7.</td> <td>Grating Motor Temp.</td> </tr> <tr> <td>8.</td> <td>Diffuser Motor Temp.</td> </tr> </tbody> </table>	<b>No.</b>	<b>Telemetry Point Name</b>	1.	SM Baseplate Temp. #2 (1)	2.	SM Shroud Temp.	3.	Depolarizer Housing Temp.	4.	HVPS Temp.	5.	Diffuser Plate Temp #2 (1)	6.	Chopper Motor Temp.	7.	Grating Motor Temp.	8.	Diffuser Motor Temp.
		<b>No.</b>	<b>Telemetry Point Name</b>																	
		1.	SM Baseplate Temp. #2 (1)																	
		2.	SM Shroud Temp.																	
		3.	Depolarizer Housing Temp.																	
		4.	HVPS Temp.																	
		5.	Diffuser Plate Temp #2 (1)																	
		6.	Chopper Motor Temp.																	
		7.	Grating Motor Temp.																	
8.	Diffuser Motor Temp.																			

		9	Cal Lamp Motor Temp.
		10.	Electrometer Temp.
		11.	Cal Lamp Power Supply Temp.
		12.	Diffuser Radiator Temp.
		13.	ELM Temp.
		14.	LVPS Temp.
		15.	Diffuser Heater Current or not applicable (2)
		16.	Baseplate Heater Current or Cal Lamp Heater Current (2)
		17.	28 V Main Power
		<b>Notes:</b> (1) powered from the 28 V analog TM BUS (2) First choice is for NOAA- F and G, second for NOAA- H, I, J, K, L and M	
A priori covariance Matrix	1b	144 elements of covariance matrix	
A priori Profile Coefficients	1b	180 coefficients for computing first guess ozone profiles	
Atmosphere Surface Backscatter Fraction	1b	Ratio used in multiple scattering correction and ozone inversion scheme (170 values)	
Averaging Kernel	PMF	The theoretical responses in the retrieval layer amounts to changes in the true atmospheric profiles. In the Version 8 product, this is a 20x20 array, associated with the 20 layers output in the product.	
Bad Quality Major Frame Flag	1b	Flag indicating one or more of the major frame quality flags has been set to true (i.e. = 1) thereby indicating a problem in the data. Bit set to 0 = no problem, 1 = problem.	
Band Center Wavelengths	1b, PMF	13 standard SBUV/2 wavelengths (Angstroms) ordered from shortest to longest range: 2500-4000 Angstroms	

Boost Mode Flag	1b	Flag indicating spacecraft in boost mode, usually the first 5 minutes following launch, during one or more TIP minor frames, therefore the data should not be used. Bit set to 0 = not boost mode, 1 = boost mode.
CCR Data	1b	Same as Monochromator Range Data, but for Cloud Cover Radiometer
CCR and Mono-chromator overrange Flags	1b	0 = not overrange
		1 = overrange; increase corresponding monochromator range or CCR data by $2^{16}$ .
		In Discrete Mode, for each monochromator range (1, 2, 3) and CCR.
		For Sweep Mode, flags for selected monochromator range for each of 10 samples, plus CCR.
		WARNING: Flags not set properly by the instrument, thus not to be used in any calculations using range counts.
Channel Error Flags	1b	<b>32 one bit flags set if inconsistent data encountered in a particular channel. Flag set if:</b>
		a) More or less than one grating mode flag is set or
		b) Inconsistent Hg lamp position given or invalid lamp position or
		c) more or less than one diffuser position given or invalid diffuser position or
		d) more than one automated sequence, given MSB represents first channel (second), LSB represents last channel (second) in 32 second major frame.
		<b>Flag settings are:</b>
		0 = no inconsistent data this channel
		1 = inconsistent data this channel
Channel Fill Flags	1b	<b>32 one bit flags set if certain errors encountered in a particular channel.</b>
		0 = no errors encountered
		1 = error encountered this channel.

		<p style="text-align: center;"><b>Error encountered is:</b></p> <p>a) data gap (all channel fill flags set in this case) or</p> <p>b) channel frame sync error or</p> <p>c) minor frame quality flag set for this channel.</p> <p>MSB represents first channel (second), LSB represents last channel (second) in 32 second major frame.</p>
DACS Quality	1b	<p><b>DACS quality for a NESDIS Orbit, containing:</b></p> <p>a) A count of input TIP minor frames that contain no frame sync word errors,</p> <p>b) A count of the DACS detected TIP parity errors (for embedded TIP, this is the count of minor frames with parity errors. For stored TIP this is the number of minor frame word groups with parity errors).</p> <p>c) A count of all auxiliary synch errors detected.</p>
DACS Status	1b	<p><b>DACS status information for a NESDIS Orbit, containing:</b></p> <p>a) P/N Flag</p> <p>0 = Normal Data</p> <p>1 = P/N Data</p> <p>b) Data Source</p> <p>0 = Unused</p> <p>1 = Gilmore</p> <p>2 = Wallops</p> <p>3 = SOCC</p> <p>c) Tape Direction</p> <p>0 = FWD (Time incrementing)</p> <p>1 = REV (Time decrementing)</p> <p>d) Data Mode</p>

		0 = Test Data
		1 = Flight Data
Data End Date And Time	All-OOPS	Year, Julian day, and second of day of last data in the data set. This data is placed in the OOPS standard header.
Data Fill Flag	1b	Flag indicating one or more minor frames of the TIP major frame contain fill data. The data should not be used. Bit set to 0 = no data fill, 1 = contains data fill.
Data Generation Date and Time	All-OOPS	Year, month, day, hour, minute and second for the creation of data in the data set. This data placed in OOPS standard header.
Data or Program Version Change Description	All-OOPS	Explanation of change(s) from previous to current version of data due to data version and/or program version change. This is placed in OOPS standard header.
Data Records Read	PMF	Number of data records from 1b data
Data Records Written	PMF	Number of data records written to PMF
Data Set Name	All-OOPS	Name of data set in OOPS standard header (e.g. Daily 1b Data Set)
Data Start Date and Time	All-OOPS	Year, Julian day, and second of day of first data in the data set. This data is placed in the OOPS standard header.
Data Type	1b	<b>Type of data where:</b>
		1 = LAC
		2 = GAC
		3 = HRPT
		4 = TIP

		5 = HIRS/2
		6 = MSU
		7 = SSU
		8 = DCS
		9 = SEM
		For SBUV/2 data, the source of data can only be 1, 2, or 3.
		<b>TIP Source:</b>
		1 = Embedded TIP
		2 = Stored Tip
		3 = Third CDA TIP
Data Version	All-OOPS	<p><b>Version number, given by <i>xxa</i>, for data/data set. Given in OOPS standard header (e.g. 01A). Number <i>xx</i> is incremented by 1 for:</b></p> <p>a) a change in the format of this data set either in the type of logical record types on the data set or the definition or arrangement of the data in a logical record type or</p> <p>b) a change in an algorithm used to generate data on the data set such that the data set generated with this new algorithm is not identical to the previous data version.</p> <p>c) a change in any input data set used to create it. The change may be caused by either an algorithm change in the program that created it or inclusion of updated data into an existing reference data set (e.g., for new ancillary coefficients).</p> <p>Letter <i>a</i> would change when the data set was regenerated with new data replacing old data or data being subtracted from the original data set but the process by which the data is calculated and placed on the data set has not changed. An example of this would be regenerating a data set by replacing missing data with good data. Any change to number <i>xx</i> would cause letter <i>a</i> to be reset to <i>A</i>.</p>
Date of Job Run	PMF	Date of data file production (e.g., MON DEC 10, 1984)

Day 1 Solar Irradiance	1b, PMF	Baseline Solar Irradiance values for each discrete monochromator channel and CCR.	
Day of Year	All-OOPS	Julian day of year. Range: 1-366	
Day of Year of First/Last Major Frame in SBUV Orbit	1b	Day of year of first/last available major frame in SBUV/2 orbit. Range: 1-366	
Digital A (Subcom) Analog House-keeping	1b	Contains the SBUV/2 housekeeping information identified. Each channel sampled twice per major frame (32 seconds). For ranges and scaling factors see Section 9.7.1.5. For all but orbital and daily statistical records on the 1b data set, these data are given in terms of counts. On orbital and daily statistical records these are given in engineering units.

		16B	Spare						
Digital B Telemetry	1b	<p>Twenty-two Digital B telemetry points which echo the SBUV/2 specific commands sent to the spacecraft. Each point is sampled at 3.2 second intervals. Digital B telemetry data specified to the SBUV/2 instrument are found in word 12 of the TIP minor frames. In order to conserve space on the 1b, only the first and sixth 3.2 second intervals are retained in the 22 least significant bits of the words. The telemetry points comprising Digital B are as follows:</p> <table border="1"> <thead> <tr> <th>No.</th> <th>Telemetry Point Name</th> <th>Logic State(1/0)</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Instrument Power</td> <td>On/Off</td> </tr> </tbody> </table>		No.	Telemetry Point Name	Logic State(1/0)	1	Instrument Power	On/Off
No.	Telemetry Point Name	Logic State(1/0)							
1	Instrument Power	On/Off							

		2	Discrete Command	Yes/No
		3	Sweep Command	Yes/No
		4	Wavelength Calibrate Command	Yes/No
		5	Position command	Yes/No
		6	High Voltage	Yes/No
		7	Motor Power	On/Off
		8	Lamp	On/Off
		9	Lamp	Enable/Disable
		10	Lamp assembly command	Open Cmd. /Closed Cmd
		11	High voltage	Enable/Disable
		12	Diffuser Stow command	Yes/No
		13	Diffuser Monitor command	Yes/No
		14	Diffuser Sun Command	Yes/No
		15	Diffuser Decontaminate Command	Yes/No
		16	Chopper Encoder Sensors	Primary/Backup
		17	Grating Encoder Sensors	Primary/Backup
		18	Diffuser Position Sensors	Primary/Backup
		19	Lamp Position Sensors	Primary/Backup
		20	Grating Drive Fix/Flex	Fix/Flex
		21	Baseplate Heater (NOAA- F & G) or Cal Lamp (NOAA- HIJKL&M)	On/Off
		22	Diffuser Heater	On/Off

Discrete/ Sweep Record	1b	0: Discrete format indicator
		1-12: Sweep record format. A complete sweep cycle is 6 major frames (2 records per frame, e.g., code 2 = second record of first frame).
		-1: either a) inconsistent data format (discrete or sweep) within major frame or b) inconsistent sweep grating position within major frame.
Dwell Mode Flag	1b	Flag indicating TIP in Dwell mode during one or more minor frames of the TIP major frame. Data in that minor frame(s) has a specific analog channel data and not the normal SBUV/2 data, therefore the data is incorrect. Bit set to 0 = not in dwell mode, 1 = TIP in dwell mode.
Effective Ozone Absorption Coefficients	1b, PMF	Computed (12 discrete + CCR) coefficients corresponding to 13 standard SBUV/2 wavelengths (shortest to longest), range 300-0 ( $\text{atm}\cdot\text{cm}^{-1}$ ).
End time	1b	TIP time code giving year, day and milliseconds of day from the last TIP major frame of data appearing in a given TIROS-N Series orbit.
Final Channel Quality Flags	1b	32 one bit flags, set if any errors encountered for this channel
		0 = No errors
		1 = errors encountered:
		a) channel error flag set this channel or
		b) channel fill flag set this channel or
		c) channel fill flag of next channel set. If current channel is last channel of current major frame, final channel quality flag is set if fill flag of first channel of next major frame is set.
		MSB refers to first two channels (first 2 seconds of major frame 0, LSB refers to last channel (second) of this major frame and first channel (second) of next major frame.

Final Residues	PMF	<p>Computed as:</p> $\frac{(Q_{obs} - Q_{msr} - Q_{ss})}{Q_{ss}}$ <p>where,  <math>Q_{obs}</math> = Q-value obtained from the observed radiance;  <math>Q_{mar}</math> = Q-value that refers only to the multi-scattered and reflected component of the total intensity (obtained from a lookup table).  <math>Q_{ss}</math> = Q-value that refers to the single scattered component of the total intensity (calculated within the program).</p>
FOV Average Cloud Amount	1b	Average cloud amount in percent for the four longest wavelength SBUV/2 FOVs.
FOV Average Cloud Top Pressure	1b, PMF	Averaged cloud top pressure in millibars for the four longest wavelength SBUV/2 FOVs.
FOV Average Cloud Temperature	1b	Averaged temperature profile in Kelvin x 64 for given pressure levels for the four longest wavelength SBUV/2 FOVs. Set to 0 if the Edit Flag indicates a bad sounding.
FOV Latitude	1b	FOV latitude is the geodetic latitude of the FOV at the start of the major frame. Expressed in degrees x 10 <sup>2</sup> . Northward latitudes are positive. Latitude range: -90 to 90 degrees
FOV Longitude at Start of First/Last Major Frame in SBUV/2 Orbit	1b	Longitude at start of first/last available major frame in SBUV/2 orbit expressed in degrees x 100. Positive longitudes are eastward. Range: -180 to 180 degrees.
FOV Snow/Ice Flag	1b, PMF	Surface condition flag indicating a frozen surface cover (i.e. snow and/or ice) for the SBUV/2 FOV.
		1 = frozen surface
		0 = non-frozen surface

		-1 = missing		
FOV Surface Pressure	1b	Surface pressure interpolated from surface pressure data set for the center of the SBUV/2 FOV halfway into the major frame (i.e., 16 seconds from TIP time). This time represents the beginning of the data collection for the four longest wavelengths used in the total ozone computation. Pressure given in mb.		
Gain Selection Code	PMF	Indicates recommended gain range for each wavelength.		
Grating Position Error		Note: for flight Model #1 the count value will range between 0 and 10 counts since the telemetry point was grounded out.		
Initial Residues	PMF	Same as final residues except that first guess ozone is used to compute $Q_{ss}$ and $Q_{msr}$		
Instrument Data Quality Flag	1b	A compilation of 4 quality flags for the time covered by this record.		
		<b>Flag</b>	<b>0</b>	<b>1</b>
		Master Power	On	Off
		High Voltage	On	Off
		Frame Sync	In Sync	Not in Sync
		Data Contamination due to automated command sequence taking place	Not Contaminated	Contaminated
		For each flag, 2 = data unavailable for determination due to fill.		
		For each flag, 3 = Inconsistent status during the 32 seconds.		
		This information pertains to all non-filled 32 seconds of data during both discrete and sweep modes except when E-CAL/Retrace is on (last 8 seconds during discrete mode or last 24 seconds at the end of a six major frame sweep cycle).		

Instrument Name	All-OOPS	Name of instrument (i.e., SBUV/2) in OOPS standard header.		
Interrange Ratio Coefficient Ranges	1b	Ratio of counts minus offset between monochromator gain		
Julian Day	1b, PMF	Day number counted from first day of current year.		
Layer Ozone	PMF	Individual ozone amounts (m-atm-cm) in 12 pressure layers.		
		<b>UMKEHR</b>	<b>LAYER #</b>	<b>mb</b>
		12	.0002-.0001	0.25 - 0.12
		11	.0005-.0002	0.49 - 0.25
		10	.0010-.0005	0.99 - 0.49
		9	.0020-.0010	1.98 - 0.99
		8	.0039-.0020	3.96 - 1.98
		7	.0078-.0039	7.92 - 3.96
		6	.0156-.0078	15.83 - 7.92
		5	.0313-.0156	31.66 - 15.83
		4	.0625-.0313	63.33 - 31.66
		3	.1250-.0625	126.66 - 63.33
			.2500-.1250	253.31 - 126.66
		1	1.0000-.2500	1013.25 - 253.31
Layer Ozone Standard	PMF	Standard deviation for solution profile individual ozone amounts (%) in 12 pressure layers.		
Level Ozone	PMF	<b>Individual ozone amounts at 19 pressure levels.</b>		
		<b>Level #</b>	<b>Level Pressure (mb)</b>	
		1	0.3	
		2	0.4	

		3	0.5
		4	0.7
		5	1.0
		6	1.5
		7	2.0
		8	3.0
		9	4.0
		10	5.0
		11	7.0
		12	10.0
		13	15.0
		14	20.0
		15	30.0
		16	40.0
		17	50.0
		18	70.0
		19	100.0
Log I <sub>o</sub>	1b	From total ozone tables, 1700 tabularized values of the natural log of the intensity of atmospheric backscattered radiation	
Log Q (Single Scattered)	1b	From multiple scattering correction tables, 1700 values of the natural log of the single scattered Q-value.	
Logical Sequence Number	PMF	Sequential record number reset to 1 at the beginning of each orbit.	
Major Frame Counter	1b	Counter of available major frames in an orbit, starting with 1.	

Major Frame Quality	1b	Single bit quality flags. Flags covering the duration (32 records) of the major frame.
		0 = no error or given circumstances has not occurred
		1 = Error or given circumstance has occurred.
		<b>See also definitions of the individual major frame quality flags:</b>
		Bad Quality Major Frame Flag
		Time Error Flag
		Dwell Mode Flag
		Boost Mode Flag
		Data Fill Flag
		Missing Attitude Error Flag
		No SBUV/2 Earth Location Flag
		Unreasonable Date or Time Flag
		Non-time Ascending Flag
		Out of Range Attitude Data Flag
		Out of Range Analog telemetry Data Flag
Out of Range Earth Location Data Flag		
Major/Minor Frame Inconsistency Flag		
Note: The MSB (leftmost bit) of the word contains the Quality Summary Flag. It is set to 1 if any other flag is 1; otherwise it is 0.		
Major/Minor Frame Inconsistency Flag	1b	(1) One or more minor frame quality flags are set to 1 (error condition) but the associated major frame quality flags (time error, dwell mode, boost mode, data fill) are not set to 1; or (2) the reverse is true: one or more of these major frame quality flags is set to 1 but no minor frame quality flag is on.
Memory Verify	1b	See TIROS-N Unique Instrument Interface for SBUV/2.

Minor Frame Quality Flags	1b	<b>32 one bit flags, each covering one channel or ten minor frames of the current major frame.</b>
		0 = no error has occurred this channel
		1 = error occurred this channel
		<b>Minor frame quality flags are set during decommutation and indicate one or more of the following occurred in the channel:</b>
		Time error
		Dwell mode
		Boost Mode
		Data Fill
Missing Attitude Data Flag	1b	One or more of roll, pitch or yaw is missing in the major frame (Bit set to 0 = All data present, 1 = missing data).
Monochromator Data	1b	Same as Monochromator Range Data but for Sweep Mode.
Monochromator Grating Position	1b	Item contains position, segment being read and digital lock indicator. Grating position: 13 bit (see byte/bit breakdown) signed integer given in counts. Count range: -4095 to 4095. (Negative numbers given as 2's complement). Note: In sweep mode, samples are taken at 10 grating positions, corresponding to 10 wavelengths, per second. The grating position that is stored in sweep mode corresponds to the last wavelength sampled in this second. See Major Frame Synchronization in Section 9.7.1.2.2 for more details.
		Segment being read: 2 bits indicating which of the four flex mode segments (memories) is being used.
		0 = segment 0 being read
		1 = segment 1 being read
		2 = segment 2 being read
		3 = segment 3 being read

		Digital Lock: 1 bit flag indicating whether the grating position was in its locked position, bit set to 1 or unlocked position bit set to 0. Data collection is valid only when the grating position is locked.
Monochromator Range Data	1b	Discrete Radiance/Irradiance counts measured by the monochromator. Range = 0 to 65,535 counts. If the corresponding Monochromator Overrange Flag is set to on (1) then add $2^{16}$ to this value. WARNING: Monochromator Overrange Flags are not set properly by the instrument. They should not be used in any calculation using range counts. If the Retrace/ECAL Flag (see Sample Status Flag #1) is on (1), this is electronic calibration data.
Monochromator Range ID	1b	<b>Corresponds to one of the three monochromator ranges.</b>
		1 = Range 2 (0-10 na, discrete mode; 0-125 na, sweep mode)
		2 = Range 1 (0-100 pa, discrete mode; 0-1.25 na, sweep mode)
		3 = Range 3 (0-1 $\mu$ a, discrete mode; 0-12.5 $\mu$ a sweep mode)
Multiple Scattering Correction	PMF	Multiple scattering and reflectivity correction to Q-value for five longer profile wavelength channels.
Multiple Scattering Mixing Fraction	PMF	Multiple-scattering mixing fraction for five longer profile wavelength channels.
Multiple Scattering Sensitivity	PMF	Sensitivity of multiple-scattering and reflectivity correction to total ozone for five longer profile wavelength channels.
N-value	PMF	Attenuation number computed as: $N = -100 \log_{10} (I/F)$ where I = Backscattered radiance and F = Incident solar flux
NESDIS Orbit Number	1b	The NESDIS orbit number is assigned by NESDIS for one revolution starting/ending at the ascending node equator crossing. For the SBUV/2 borne afternoon satellite the NESDIS orbit number at the start of the SBUV/2 orbit will be the same as the SBUV/2 orbit number. The NESDIS orbit number at the end of the SBUV/2 orbit will be one greater than the SBUV/2 orbit number.

No SBUV/2 Earth Location Data Flag	1b	Flag indicating no Earth location data is available for either the start or end of the TIP major frame data. Bit set to 0 = Earth location present, 1 = missing Earth location data.
Non-Time Ascending Data Flag	1b	Flag indicating major frame date or time precedes previous major frame. Bit set to 0 = no problem, 1 = non-time ascending data.
Number of Coefficients for Interrange Ratios	1b	Number of discrete monochromator channels for which interranging ratios are given.
Number of Data Gaps	1b	Number of data gaps occurring in a given TIROS-N series (NESDIS) Orbit. A data gap that covers one or more consecutive TIP major frames is counted as one data gap. NESDIS orbits, as transmitted, may include some overlap with the previous or subsequent orbit. Data gaps that occur in the overlap will be included in the counters for both NESDIS orbits.
Number of Major Frames	1b	Total number of TIP major frames in a given TIROS-N (NESDIS) Orbit. NESDIS orbits, as transmitted, may include some overlap with the previous or subsequent orbit. Major Frames in the overlap will be included in the counters for both NESDIS orbits.
Number of Iterations	PMF	Number of iterations used by the profiling algorithm in a given retrieval.
OOPS Standard Header	ALL-OOPS	Audit trail information at the beginning of each OOPS data set.
		<b>Required:</b>
		Record ID
		Spacecraft ID
		Instrument name
		Data set name
		Data version
		Data generation date & time
Program name		

		Program version and data
		<b>Optional (when applicable):</b>
		Data start date and time
		Data end date and time
		Version Change description
		Standard/Non-standard
		Wavelength Flag
Out of Range Analog	1b	Flag indicating one or more Telemetry data Flag analog telemetry points is outside the range given in Data Dictionary. Bit set to 0 = all data in range, 1 = one or more points out of range.
Out of Range Attitude Data Flag	1b	Flag indicating one or more attitude quantities (roll, pitch, and yaw) in major frame is outside the range given in the Data Dictionary. Bit set to 0 = all attitude data in range, 1 = values out of range.
Out of Range Earth Location Data Flag	1b	Flag indicating one or more Earth location values is outside the range given in the Data Dictionary. Bit set to 0 = all Earth location data in range, 1 = value(s) out of range.
Ozone Error Flags	PMF	<b>Total Ozone</b>
		0 - Low path length, good scan
		1 - High path length, good scan
		2 - Very high path, good scan
		3 - Spare
		4 - Inconsistency between best ozone and the largest weighted ozone pair
		5 - Difference between best ozone and total ozone for profile greater than three sigma
		6 - Spare
		7 - Photometer Reflectivity and monochromator reflectivity differ by more than 0.15

		8 - Best Reflectivity out of range (less than - 0.05 or greater than 1.05)
		9 - A-pair, B-pair or C-pair ozone exceeds the dynamic range of the tables. The dynamic ranges are:
		Latitude less than 15° : 180 to 350 Dobson Unit (DU)
		Latitude 15° to 45° :180 to 600 DU
		Latitude greater than 45° : 180 to 650 DU
		10-19 Same as above except the data taken in descending mode.
		<b>Profile:</b>
		0 - No error
		1 - Lower level anomaly
		2 - Inconsistency between best ozone and profile total ozone
		3 - Final residue greater than three sigma
		4 - Measured Q-value calculated with a priori profile and multiple-scattering/Reflectivity correction
		5 - C greater than 3.0 DU or less than 0.5
		6 - Sigma greater than 0.8 or less than 0.3
		7 - Reflectivity is less than -0.05, greater than 1.05, or changes by more than 0.05 from wavelength to wavelength
		8 - Total ozone not available or in-band stray light contamination
		9 - Bad radiance or eclipse contamination
		10-19 Same as above except the data taken in descending mode.
Ozone Mixing Ratios	PMF	Solution mixing ratio (micro-gm/gm) at 19 pressure levels
Ozone Sensitivity	PMF	Sensitivity of a pair of wavelengths is defined as $dN_p/dO$ , where $N_p$ is the difference in the N-value of pair wavelengths and O is the total ozone

Percent Cloud	PMF	Percent cloud cover computed by Product Processor using CCR and snow/ice information (0 - 100).
Pitch Euler Error Angle	1b	Pitch Euler error angle of the spacecraft given in radians x 8,192. Expected range: -0.2 to 0.2 degrees (3 sigma).
Prelaunch Radiance /Irradiance Calibration	1b	Instrument specific prelaunch radiance or irradiance counts to engineering units conversion constants for each of 12 discrete wavelengths at each of 3 PMT gain ranges, plus 1 value for CCR. (Irradiance: W/cm <sup>3</sup> , radiance: W/cm <sup>3</sup> /sr).
Pressure of Reflecting Surface	PMF	Effective surface pressure (mb).
Processing Block Identification	1b	Seven digit (ASCII) number identifying the spacecraft revolution (NESDIS orbit number) in which recording of this data set began and the revolution (NESDIS orbit number) in which it terminates (the first 5-digits identify the beginning revolution and the last two identify the concluding revolution).
Processing Counters	PMF	<b>The following counters have been defined for total ozone processing:</b>
		1 - not used (0)
		2 - data records read
		3 - data records written
		4 - output records unprocessed (5+7)
		5 - solar zenith angle greater than limit
		6 - not used (0)
		7 - bad counts and solar eclipse data
		8 - Non-zero total ozone error flag (sum of 9-14)
		9-18 - total ozone error flags 9-0 (reverse order)
		19 - bad radiance (profile wavelength only)
		20 - no total ozone available
21 - records with profile ozone error flag greater than 2		

		22-28- profile ozone error flags 3-9
Processing Options	PMF	<b>There are 20 possible processing options, only four of which are currently implemented (false - disabled, true - enabled):</b>
		6 - Profile processing
		7 - Do not use seventh channel in profile processing
		8 - Do not use first channel in profile processing
		9 - Do not use ninth channel in profile processing
Processing Parameters	PMF	<b>Limiting values used to edit input 1b data. They include:</b>
		Maximum SZA 0-90 degrees
		Minimum latitude -90 to +90 degrees
		Maximum latitude -90 to +90 degrees
		Minimum latitude must be less than maximum latitude (under normal processing conditions, max. SZA = 92°, min. latitude = -90, max. latitude = +90).
Program Name	All-OOPS	Name of program that generated the data. Name in OOPS standard header.
Program Version	All-OOPS	Version number given as xx.yy, for program. This is given in OOPS standard header (e.g., 01.01) Number xx is incremented by 1 when a change in the program alters the format of the output data set(s) or the contents of the output data set(s) other than generation run time, such that if the program was rerun with the same input data sets, it would not generate an identical (except for generation run time) output data set.  Number yy is incremented by 1 when a change in the program does not alter the format or content of the output data set. Such changes might be enhancements to printed output, insertion of additional comments to the program, etc. Any change to number xx would cause number yy to be reset to 01.
Program Version Date	All-OOPS	Year, month and day that generating program version was made operational.
Q-Value	PMF	Normalized radiance - irradiance ratio. Given for each profile wavelength.

Radiance Calibration	PMF	Counts to radiance conversion factors used in ozone computation ( $W/cm^3/sr/count$ ).
Radiometric DC Level	1b	TIROS-N Unique Instrument Interface for SBUV/2.
Rayleigh Scattering Coefficients	1b, PMF	Rayleigh scattering coefficients computed for each of the 13 (12 discrete + CCR) SBUV/2 wavelengths, in order from short to long.
Recommended Monochromator Range Data	1b	Actual counts obtained for the recommended monochromator range.
Recommended Monochromator Range ID	1b	One of the three monochromator range ID's, it is chosen as follows:
		If Range 3 data is greater than or equal to 719 counts then Range ID = 3.
		If Range 2 data is greater than or equal to 719 counts and Range 3 data is less than 719 counts the Range ID = 2
		If Range 2 and 3 are less than 719 counts then range ID = 1
Record ID	All-OOPS	Unique record identification number for each record type in the 1b Data Set. See Table 9.7.1.4-1.
Reflected Fraction	1b	1700 values of this ratio used in the multiple scattering correction and ozone inversion scheme.
Reflectivity	PMF	Effective surface reflectivity computed by total ozone algorithm (fraction).
Reflectivity Difference	PMF	Difference between the reflectivity computed using the photometer and that using the monochromator.
Roll Euler Error Angle	1b	Roll Euler error angle of the spacecraft given in radians x 8192. Expected range -0.2 to 0.2 degrees (3 sigma)
SBUV/2 Day Number	1b	The day number of the first major frame of the current SBUV/2 orbit, counted from day of launch.

SBUV/2 Orbit Number	1b, PMF	An SBUV/2 orbit is defined as data collected from one revolution of the Earth starting/ending at the dark side of Earth equator crossing. For an afternoon satellite (the SBUV/2 instrument will only be carried on an afternoon satellite), the dark side equator crossing occurs on the descending node. The SBUV/2 orbit number is based on the NESDIS orbit number in that it will be the same as the NESDIS orbit number for the first half of the SBUV/2 orbit (i.e. from descending node equator crossing to ascending node equator crossing). For the second half of the SBUV/2 orbit the NESDIS orbit number would be one greater.
Sample Status Flag #1	1b	<b>A series of status flags:</b>
		Data format: discrete/Sweep (0/1)
		Retrace (ECAL) Off/On (0/1);
		ECAL Step #A-E (0-7) where:
		Step A = 1 to 4
		B = 5
		C = 6
		D = 7
		E = 0
		Grating Mode:
		0 = Discrete
		1 = Wavelength Calibration
		2 = Position
		3 = Sweep
		4 = Diffuser Decontamination
7 = Inconsistent (i.e., more than one mode set)		
(Differs from Ball Brothers convention) Information pertains to 2 second interval (one discrete sample) in discrete mode; pertains to one second interval for sweep mode (ten sweep samples).		

Sample Status Flag #2	1b	<p>A series of status flags:  Grating Memory Mode: Fix/Flex(1/0)  Grating Index: Found/Not Found(1/0)  Frame Sync Code: In Sync/Not in Sync(0/1)  Automated Command:  0 = None enabled  1 = Discrete sun enable  2 = Sweep sun enable  3 = Wavelength-calibration enable  Command Sequence state: Step number for one of three Automated Command Sequences, three series of SBUV/2 commands designed to provide for execution of a number of commands with only a single command being sent. These three set sequences, namely Discrete Sun Enable, Sweep Sun Enable and Wavelength Calibration Enable, each have up to eight command sequence states. In each command sequence, a particular SBUV/2 command is executed. Information pertains to two second interval (one discrete sample) in discrete mode; pertains to one second interval for sweep mode (ten sweep samples).</p>
Sample Status Flag #3	1b	<b>A series of status flags:</b>
		Master Power On/Off (0/1)
		Calibration Lamp timer: Not Time Out/Time Out (0/1)
		Cal-Lamp Position: Open(0); Closed (1); Inconsistent or Invalid (3)
		Diffuser Timer: Not Time Out/Time Out (0/1)
		Diffuser Position:
		0 - Stowed
		1 - Sun
		2 - Monitor
		3 - Decontaminate
		7 - Invalid
		Information pertains to two second interval (one discrete sample)

		in discrete mode; pertains to one second interval for sweep mode (ten sweep samples).
Sample Status Flag #4	1b	<b>A series of status flags:</b>
		Code Address A
		Code Address B
		Code Data Bit 1 to 6 (LSB) information pertains to two second interval (one discrete sample) in discrete mode; pertains to one second interval for sweep mode (ten sweep samples).
Scene Mode	1b	<b>Radiance Source to the SBUV/2 instrument</b>
		0 = Earth Scene
		1 = Same as above except for diffuser sun scene.
		2 = Same as above except for direct Hg lamp scene
		3 = Same as above except for diffuser-Hg lamp scene.
		7 = Scene mode unavailable for determination (all channel fill flags set)
		9 = Inconsistent/changing scene mode
		This information pertains to all non-filled 32 seconds of data during both discrete and sweep modes except when E-CAL/Retrace is on (last 8 seconds during discrete mode or last 24 seconds at the end of a six major frame sweep cycle) or fill encountered.
Seconds of Day	All-OOPS	Seconds of day. Range: 0-86,399.
Seconds of Day at Start of First/Last Major Frame in SBUV/2 Orbit	1b	Seconds of day at start of first/last available major frame in SBUV/2 orbit. Range: 0-86,399.

Solar Azimuth Angle at FOV	1b	Solar azimuth angle measured in the tangent plane from a line through the FOV due north to the projection of the sun line into the tangent plane. Measured clockwise as seen from the zenith. Expressed in degrees x 100. Range: -180 to 180 degrees.
Solar Declination	1b	Solar declination (celestial latitude) angle at the start of the major frame. This is an angle between the sun and the inertial equator measured in a plane normal to the inertial equator (meridian) containing the sun. North of the equator is positive. Expressed in degrees x 100. Range: -90 to 90 degrees
Solar Right Ascension	1b, PMF	Solar right ascension (Celestial longitude) angle at the start of the major frame. This angle is measured in the plane of the equator from a fixed inertial axis in space (Vernal Equinox) to a plane normal to the equator (meridian) containing the sun. Eastward from the Vernal Equinox is positive. Expressed in degrees x 100. Range: -180 to 180 degrees.
Solar Zenith Angle at FOV	1b, PMF	Solar zenith angle, measured at the FOV between the zenith normal to the tangent plane (horizon) at the FOV and the sun. Expressed in degrees x 100. Range: 0 to 180 degrees.
Spacecraft Altitude	1b	The spacecraft altitude, in integer kilometers at the start of the major frame. Range: 833 ± 90 km.
Spacecraft Centered Solar Azimuth Angle	1b	Solar azimuth angle in spacecraft centered coordinate system. Expressed in degrees x 100. Range: -180 to 180 degrees.
Spacecraft Centered Solar Elevation Angle	1b	Solar elevation angle in spacecraft centered coordinate system. Expressed in degrees x 100. Range: -180 to 180 degrees.
Spacecraft Identification	1b	<b>The identifier of the spacecraft from which the data was obtained where:</b>
		0 – Spare
		1 - TIROS-N                      NOAA-H (N-11)
		2 - NOAA-A (N-6)              NOAA-I (N-13)

		3 - NOAA -B                      NOAA-J (N-14)
		4 - NOAA - C(N-7)              NOAA-K (N-15)
		5 - NOAA -D (N-12)
		6 - NOAA -E (N-8)
		7 - NOAA -F (N-9)
		8 - NOAA- G (N-10)
Spacecraft Name	All-OOPS	TIROS-N series spacecraft name (e.g., NOAA-8) in OOPS standard header.
Standard/ Non-standard Wavelength Flag	1b	Indicates that (1) one or more of the 12 discrete wavelengths in one or more major frames (determined from grating mode position) does not match the wavelengths in the Ancillary Data Set, and/or (2) the start sweep mode wavelength in one or more scans does not match the preassigned value. This condition is expected to occur when wavelengths are changed using FLEX mode for special scientific studies:
		STND = All wavelengths standard,
		SPEC = One or more non-standard wavelengths detected in this Daily 1b Data Set
Start Time	1b	TIP time code given in year, day, and milliseconds of day from the first TIP major frame of data appearing in a given TIROS-N (NESDIS) orbit.
Subsatellite Latitude	1b, PMF	Subsatellite geodetic latitude at the start of the major frame as expressed as degrees x 100. Positive latitudes are northward, Range: -90 to 90 degrees (expressed as decimal degrees on PMF).
Subsatellite Longitude	1b, PMF	Subsatellite longitude at the start of the major frame expressed as degrees x 100. Positive longitudes are eastward. Range: -180 to 180 degrees (expressed as decimal degrees on PMF ).
Summary Grating Memory Wavelength	1b	0 = fix mode; standard wavelength
		1 = flex mode; standard wavelength
		2 = fix mode, non-standard wavelength
		3 = flex mode, non-standard wavelength

		7 = mode unavailable for determination (all channel fill flags set)
		9 = inconsistent/changing mode
		This information pertains to all non-filled 32 seconds of data during both discrete and sweep modes except when E-CAL/Retrace is on (last 8 seconds during discrete mode or last 24 seconds at the end of a six major frame sweep cycle)
Summary Grating Mode	1b	<b>Monochromator Grating Mode:</b>
		0 = Discrete Mode
		1 = Wavelength Calibration Mode
		2 = Position Mode
		3 = Sweep Mode
		4 = Diffuser Decontamination Mode-(based on diffuser position only)
		7 = Grating mode unavailable for determination (all channel fill flags set)
		9 = Inconsistent/changing modes
		This information pertains to all non-filled 32 seconds of data during both discrete and sweep modes except when E-CAL/Retrace is on (last 8 seconds during discrete mode or last 24 seconds at the end of a six major frame sweep cycle).
Table Selection Index	PMF	Indicates standard profile used in profiling algorithm (1-3)
Terrain Surface Pressure	PMF	Terrain surface pressure (atm)
Time Error Flag	1b	Flag indicating a time error has occurred in one or more of the minor frames of the TIP major frame, thus the data is not correctly time matched and should not be used. Bit set to 0 = no time error, 1 = time error.
Total Ozone	PMF	Total ozone (m-atm-cm)

UMKEHR		Procedure to get a vertical ozone profile from the ground up using a Dobson Spectral Photometer
Unreasonable Date or Time Flag	1b	Flag indicating unreasonable major frame year, day of year, or seconds of day, i.e., year less than 0 or greater than 99, day of year less than 0 or greater than 366, seconds of day less than 0 or greater than 86,399. Bit set to 0 = data in range, 1 = data out of range
Upper Profile Parameters	PMF	Parameters C and s determined by assuming an ozone profile of the form: $X(p) = Cp^{1/s}$ where p = pressure in mb, X= cumulative ozone at pressure level p, s = ratio of the atmospheric scale height and ozone scale height, C = ozone at 1 mb (DU).
View Latitude	PMF	Latitude interpreted to the time of measurement of selected wavelengths (-90.0 to 90.0).
View Longitude	PMF	Longitude interpreted to the time of measurement of selected wavelengths (-180.0 to 180.0).
Volcano Contamination Index	PMF	A measure of the amount of aerosols. Ranges from approximately -10 to +20. Uncontaminated data should be approximately zero. +20 represents maximum contamination. Negative numbers are due to noise in the measurements.
Yaw Euler Error Angle	1b	Yaw Euler error angle of the spacecraft given in radians x 8,192. Expected range: -0.2 to 0.2 degrees (3 sigma).
Year	All-OOPS	Year of First/Last Major Frame in SBUV/2 Orbit. Two digit year (e.g., 84) except digit year in PMF.
Year of First/Last Major Frame in SBUV/2 Orbit	1b	2 digit year of first/last available major frame in SBUV/2 orbit.

## 9.8 AEROSOL/OPTICAL THICKNESS PRODUCTS

NOAA/NESDIS currently produces Aerosol products from NOAA-14 AVHRR data on a weekly basis, using a revised (Phase 2) single channel algorithm for aerosol optical thickness retrieval over oceans from radiances in Channel 1. This algorithm scales the upward satellite radiances in

cloud-free conditions to aerosol optical thickness using an updated radiative transfer model of the ocean and atmosphere. The primary products are a global one degree map of Aerosol Optical Thickness based on a composite of one week's worth of data and the monthly mean product.

These products are archived at the National Climatic Data Center in both hardcopy chart and digital dataset form.

### 9.8.1 AEROSOL DAILY SUMMARY FILE

The Aerosol Daily Summary File contains statistical information pertaining to aerosol observations in each of the earth's 648 (10 degrees x 10 degrees) Lat/Long boxes.

#### 9.8.1.1 File Structure Description

The first record is a directory record and all other records are data records. There are 41 records in the file.

#### 9.8.1.2 Directory Record Format

The directory record contains information about the time of the data in the file and pointers to the data records for particular Julian Days. Table 9.8.2.2-1 contains the directory record format.

<b>Table 9.8.1.2-1. Aerosol Daily Summary Directory Record Format.</b>		
<b>Halfword</b>	<b>Quantity</b>	<b>Range</b>
1	# of records in the file	41 (initially)
2	Year of most recent data in the file	0-32767
3	Record number updated most recently	1-41
4	Julian day of data in first data record	1-366
5	Julian day of data in second data record	1-366
6 to N + 3	Julian day of data in the 3rd through Nth data record	1-366

#### 9.8.1.3 Data Record Format

Each data record contains all data for a particular day. There are 648 blocks of information (1 block for each 10 degrees x 10 degrees Lat/Long box on the globe). Each block is 20 bytes long and thus each record is 20 x 648 or 12,960 bytes in length. The blocks are organized within each data record sequentially from West to East with the first block containing statistics from the box

enclosed by -90.00 to -80.01 degrees latitude (-S, +N) and -180.00 to -170.01 degrees longitude (-W, -E). The second block has statistics from the next box to the east or the box bounded by -170.00 to -160.01 degrees longitude and -90.00 to -80.01 degrees latitude. The 37th block therefore contains statistics for the box -180.00 to -170.01 degrees longitude and -80.00 to -70.01 degrees latitude.

To calculate the starting byte number for the 20-byte block of statistics for a particular (10 degree x 10 degree) box within a data record, the following formula can be used:

$$StartingByteNo. = \left( 36 \times \frac{(LLLA - OLA)}{10} + \frac{(LLLO - OLO)}{10} \right) \times 20 + 1$$

where:

LLLA = Lower left latitude of desired (10 x 10 degrees) box,

LLLO = Lower left longitude of desired box,

OLA = Latitude of file origin = -90.00 and

OLO = Longitude of file origin = -180.00.

The documentation record is contained in a 20-byte block as shown in Table 9.8.2.2-1.

<b>Table 9.8.1.3-1. Aerosol Daily Summary File Documentation Record Format.</b>			
<b>Halfword</b>	<b># of Bytes</b>	<b>Quantity</b>	<b>Range</b>
1	2	Number of observations in the box	0-32767
2	1	Maximum optical thickness (O.T.) for the box (x 100).	0-244
2	1	Minimum O.T. for the box (x 100)	0-244
3-4	4	UTC of maximum O.T. value. (Hours x 10,000) + (minutes x 100) + seconds.	0-235959
5	2	Latitude of observation with maximum O.T. value. (Degrees x 100)	-9000 to 9000
6	2	Longitude of observation with maximum O.T. value. (Degrees x 100)	-18000 to 18000
7	1	Spare	n/a
7	1	Mean optical thickness for box (x100).	0-244

8	2	# of observations with O.T. above extreme event threshold	0-32767
9-10	4	Spare	n/a

## 9.8.2 AEROSOL WEEKLY 100 KM ANALYZED FIELD FILE

An aerosol optical thickness 100 km analyzed field file consists of a specific set of information pertaining to global latitude and longitude intersections. The one degree resolution file, includes the area from -180 degrees to +179 degrees longitude and from -70 degrees to +70 degrees latitude.

### 9.8.2.1 File Structure Description

The file consists of one documentation record (record number one), followed by one record for each latitude or row of the field. Record 2 or the first latitude row is the southernmost row or the 70 degrees South row. Each row consists of seven words (28 bytes) of information for each longitude column forming a grid intersection plus one seven-word unit containing the row number identification and the date and time of the last analysis made for the field. The first grid intersection of each row is the 180 degree west meridian or the date line. Grid points proceed to the east across the record from left to right ending with the 179 degree East meridian. The documentation record is created from a name list dataset and is displayed in name list format, although it is stored as a binary record. The record size is 10,108 bytes.

### 9.8.2.2 Documentation Record Format

Table 9.8.2.2-1 contains the format for the documentation record of the Aerosol Weekly 100 km analyzed field file.

<b>Word #</b>	<b>Parameter</b>	<b>Description</b>
1	LDBGN	Record number of the first row of the field (currently 2 for all fields since the documentation record requires only one record).
2	SMGLAT	Minimum latitude included in field which is the bottom edge and first row of field
3	AXLAT	Maximum latitude included in field which is the top edge and last row of field.
4	SMLONG	Minimum longitude included in field which is the left edge and first column of field.

5	AXLONG	Maximum longitude included in field which is the right edge and last column of field (excluding the I.D. column).
6	RES	Number of latitude/longitude degrees between each grid point
7	SMHOUR	Youngest time, in hours of the year, of observations used during last analysis, which becomes the oldest time allowed for the next analysis. If the difference between this time and time of next analysis is greater than the maximum time gap allowed, SMHOUR for the beginning of the next analysis is reduced to make the difference equal to the maximum time gap.
8	HOURS	Oldest time, in hours of the year, of observations used during last analysis.
9	TIMGAP	Number of hours between youngest and oldest times of observations used in analysis.
10	MAXDAT	Maximum number of hours allowed in time period for observation times to be included in analysis.
11	SMREL	Minimum reliability of observations to be used in analysis.
12	AXREL	Maximum reliability of observations to be used in analysis.
13-22	SORC(10)	List of source codes of observations to be used in analysis.
23-32	OBTYPE (10)	List of observation types allowed to be used in analysis.
33	NROWS	Number of rows (latitudinal parallels) included in field, excluding documentation record.
34	NCOLS	Number of columns (longitudinal meridians) in field, including the I.D. column.
35	IBLK	Number of rows or logical records per physical block.
36	NWRDS	Number of full words (32 bits) allocated to each grid point.
37	ISZ	Number of rows to be maintained in an array in core for optical thickness and analysis and calculation of gradients.
38	ICENT	Center line within the array upon which calculations will be performed.

39-41	LWT, LNT, LBT	Word number, length in bits, and starting bit location of optical thickness within a grid intersection information unit of an SST Field.
42-44	LWG, LNG, LBG	Word number, length in bits, and starting bit location of Average Gradient.
45-47	LWGXP, LNGXP, LBGXP	Word number, length in bits, and starting bit location of Gradient X+direction.
48-50	LWGYN, WNGYN, LBGYN	Word number, length in bits, and starting bit location of Gradient Y+direction.
51-53	LWGYN, LNGYN, LBGYN	Word number, length in bits, and starting bit location of Gradient Y-direction.
54-56	LWPD, LNPD, LBPD	Word number, length in bits, and starting bit location of Physiographic Descriptor.
57-59	LWNO, LNNO, LBNO	Word number, length in bits, and starting bit location of Number Observations.
60-62	LWAGE, LNAGE, LBAGE	Word number, length in bits, and starting bit location of Age Recent Observation
63-65	LWREL, LNREL, LBREL	Word number, length in bits, and starting bit location of Reliability.
66-68	LWCLS, LNCLS, LBCLS	Word number, length in bits, and starting bit location of Class 1 Coverage.
69-71	LWSXP, LNSXP, LBSXP	Word number, length in bits, and starting bit location of Spatial Covariance in the positive X direction.

75-77	LWSXN, LNSXN, LBSXN	Word number, length in bits, and starting bit location of Spatial Covariance in the negative X direction
78-80	LWSYP, LNSYP, LBSYP	Word number, length in bits, and starting bit location of Spatial Covariance in the positive Y direction.
81-83	LWSYN, LNSYN, LBSYN	Word number, length in bits, and starting bit location of Spatial Covariance in the negative Y direction.
84-86	LWIND, LNIND, LBIND	Word number, length in bits, and starting bit location of Independent Temperature.
87-96	GRDWTS (10).	Weight assigned to each grid unit, according to its distance from the grid intersection for which gradients are being calculated
97	NP	Number of grid points to be used in calculation of gradients.
98-117	KMDST (10,2)	Look up table of gradient values and corresponding distances to be used in determining the search area for analysis.
118	MKM	Number of paired entries in KMDST.
119-138	H(10,2)	Look up table of gradient values and corresponding factors to be used in determining the new weight assigned to the observation temperature for analysis.
139	MH	Number of paired entries in H.
140	EXP	Exponent used in temperature analysis.
141	FDX	Factor used in determining new weight assigned to the optical thickness observation for analysis.
142	XCLASS	Factor used to place gradients into a class for Gradient Class Summary
143	DEL	Maximum number of optical thickness units that the new analysis temperature may differ from the previous optical thickness field value.
144	MF	Factor applied to the previous optical thickness and reliability to determine the final optical thickness and its reliability.

145	MSTAR	Factor applied to the combined observations temperature and weight in determining the new analysis optical thickness
146	MNSRCH	Minimum distance in kilometers to be searched for analysis observations.
47	MXSRCH	Maximum distance in kilometers to be searched for analysis observations.
148	BDEL	Maximum difference allowed between new analysis optical thickness and the previous one for the Class 1 Coverage Bit to be set to 1.
149	FCWT	Maximum value that can be assigned as the reliability of the new analysis optical thickness.
150	IYYY	Year of youngest time of observation data used (0-99).
151	IYMM	Month of youngest time of observation data used (1-12).
152	IYDD	Day of youngest time of observation data used (1-31).
153	IYHH	Hour of youngest time of observation data used (0-23).
154	IOYY	Year of oldest time of observation data used (0-99).
155	IOMM	Month of oldest time of observation data used (1-12).
156	IODD	Day of oldest time of observation data used (1-31).
157	IOHH	Hour of oldest time of observation data used (0-23).
158	ICURTM	Last time used in analysis

Values are stored as real (IBM floating-point) or integer according to the format implied by the first letter of their label. (Parameters beginning with I, J, K, L, M and N are integer values.)

### 9.8.2.3 Data Record Format

Each data record (latitudinal row) consists of a series of grid intersection points. These points are 28 bytes in length. Each longitude (column) reflects one grid intersection. At the end of the data record (i.e., immediately following the last column) is a 28 byte row identifier. All parameters are stored as integer values.

**Table 9.8.2.3-1. Format of Grid Intersection in Data Record.**

Word #	Length (bytes)	Description	Units	Comments
1	2	Optical Thickness	x 1000	0 to 2440
1	2	Average Gradient	units/100 km (x 1000)	0 to 300
2	2	Gradient X+	units/100 km (x 1000)	0 to 300
2	2	Gradient X-	units/100 km (x 1000)	0 to 300
3	2	Gradient Y+	units/100 km (x 1000)	0 to 300
3	2	Gradient Y-	units/100 km (x 1000)	0 to 300
4	1	Physiographic Descriptor	0=sea 1=land	0 to 15
4	1	Spare	Undefined	0 to 255
4	1	Number observations	Integer	0 to 255
4	1	Age Recent Observation	Hours	0 to 255
5	2	(Weight) Wxy	Integer	0 to 32767
5	2	Class 1 Coverage	Bits	0 to 1
6	1	Spatial Covariance X+	Grid Units	0 to 10
6	1	Spatial Covariance X-	Grid Units	0 to 10
6	1	Spatial Covariance Y+	Grid Units	0 to 10
6	1	Spatial Covariance Y-	Grid Units	0 to 10
7	2	Climatological Temperature	degrees C (x 10)	-850 to +610
7	2	Spare	Undefined	0 to 32767

### **DEFINITION OF TERMS IN GRID INTERSECTION**

**Optical Thickness** - The latest Aerosol Optical Thickness calculated based on the previous analysis optical thickness, weighted according to its reliability, combined with a weighted average of current observations within a surrounding area which is determined according to the grid point's gradient.

**Average Gradient** - The average of the gradients in all four directions (N, S, E, W) from the grid intersection.

**Gradient in X+ Direction** - Change in optical thickness between the grid point and neighbor points within the field in the positive direction along the X axis.

**Gradient in X- Direction** - Change in optical thickness in the negative direction along the X axis.

**Gradient in Y+ Direction** - Change in optical thickness in the positive direction along the Y axis.

**Gradient in Y- Direction** - Change in optical thickness in the negative direction along the Y axis.

**Physiographic Descriptor** - The land/sea tag indicating whether a grid intersection is a land or sea point.

**Spare** - Unused parameter.

**Number of Observations** - The total number of current observations used in the analysis of the new optical thickness for the grid intersection.

**Age of Most Recent Observation** - The age, in hours from the time of last analysis, of the most recent observation used to determine the new optical thickness for a grid intersection.

**Reliability** - New reliability associated with the new optical thickness, based on the previous reliability combined with the weighted reliability of all observations used in the last analysis.

**Class 1 Temporal Coverage** - Set of bits (0-15) of which bit 1 is set to 1 for each analysis which included observations with a reliability greater than or equal to a specific minimum reliability considered as class 1. Bit 0 always remains a 0, and all bits are shifted right during each analysis leaving bit 1 a 0 when no class 1 reliability observations are used for a grid intersection.

**Spatial Covariance X+** - The distance in grid units from the grid intersection to the nearest land mass in the positive direction along the X axis.

**Spatial Covariance X-** - The distance in grid units from the grid intersection to the nearest land mass in the negative direction along the X axis.

**Spatial Covariance Y+** - The distance in grid units from the grid intersection to the nearest land mass in the positive direction along the Y axis.

**Spatial Covariance Y-** - The distance in grid units from the grid intersection to the nearest land mass in the negative direction along the Y axis.

**Independent Grid Temperature** - The average sea surface temperature of a grid intersection for a particular month over a number of years, taken from the global climatology file.

Table 9.8.2.2-2 gives the row identification information. NOTE: All parameters are stored as integer values. Words 5 to 7 are the date and time at which analysis was performed.

<b>Table 9.8.2.3-2. Row Identification Information.</b>				
<b>Full Word</b>	<b>Length (bytes)</b>	<b>Description</b>	<b>Units</b>	<b>Comments</b>
1	4	Row	Integer	1-141
2	4	Spare	Undefined	n/a
3	4	Spare	Undefined	n/a
4	1	Marker	Integer	Always 255
4	3	Spare	Undefined	n/a
5	4	Hour of Day, Minutes of Hour	(100 x Hours) + Minutes	0-2359
6	4	Day of Year	Days	1-366
7	4	Year	Years	????

### 9.8.3 AEROSOL MONTHLY MEAN FIELD FILE

The Aerosol Monthly Mean Field File is a gridded file of optical thicknesses and other information. The optical thickness at each grid point is the average of the optical thicknesses calculated for each week within the month at that grid point. If an analyzed field was updated during the month, then it will be used in the calculation of the monthly mean.

#### 9.8.3.1 File Structure Description

The first record is a header which contains satellite ID, the month, the year, and the number of fields used in the computation of the mean. The remaining records are data records. Each data record contains all data for one latitudinal row. The latitude range is from -70 to 70 degree. The first data record will contain data from the -70 degree latitude row and the second will contain data from the -69 degree row and so on. Each row will begin with information from the -180 degree meridian and progress eastward to the 179 degree meridian. Each grid point will contain 10 bytes of information thus each record will contain 3600 bytes.

### 9.8.3.2 Header Record Format

The format of the header record is contained in Table 9.8.3.2-1.

<b>Table 9.8.3.2-1. Header Record Format.</b>		
<b>Halfword</b>	<b>Description</b>	<b>Comments</b>
1	Month	1-12
2	Year	1988 - ?
3	Satellite ID	1-8
4	Number of fields used in mean calculation	1-5
5-1800	Spares	n/a

### 9.8.3.3 Data Record Format

Each data record represents one row of latitude with each 5 halfwords representing a specific grid point or intersection with a meridian. Table 9.8.3.2-2 shows the format of the grid intersections in the data record.

<b>Table 9.8.3.3-1. Grid intersection format.</b>		
<b>Halfword</b>	<b>Description</b>	<b>Comments</b>
1	Average Optical Thickness	0 to2440, -999=land
2	Maximum Weekly Optical Thickness for the Month	0 to2440, 0=land
3	Minimum Weekly Optical Thickness for the Month	0 to2440, 0=land
4	Number of weekly field values which were analyzed from at least 1 retrieval which was less than 8 days old.	0 to 5, 0=land
5	Spare	n/a

### 9.8.4 AEROSOL OPTICAL THICKNESS 8-DAY OBSERVATION FILE

The Aerosol Observation File contains eight days of Sea Surface Temperature (SST) retrievals containing a single-channel (AVHRR Channel 1) optical thickness parameter  $\tau^A$ . The SSTs in these retrievals are "aerosol-corrected" SSTs, but the uncorrected SSTs are also contained within the observation. The layout of the file is identical to the SST 8-day observation file with the

exception that the 2-bytes used to store a water vapor parameter in the SST retrieval are used for an aerosol optical thickness value and a spare area is used for the uncorrected SST. This data file consists of 4,002 physical records each with a length of 13,024 bytes.

#### 9.8.4.1 File Structure Description

The organization of the file is as follows: earth is divided into 5 degree by 5 degree blocks and by 1 degree by 1 degree subblocks within each block. The blocks are numbered from 1 to 2592 with the origin or first block at 180 degrees West (or -180) and 90 degrees South (or -90). Block numbers increase by 1 to the east and by 72 to the north. To locate information in an area, the block number is found which corresponds to the block encompassing the area. A table in the directory record points to the record which contains the desired block. After locating the record containing the block, another table at the beginning of the record locates the proper location of the desired subblock.

The file has overflow records and as such expands and contracts as data are available.

The first record is the directory record containing the block directory and other information. All other records are data records, each containing a subblock directory followed by observations.

#### 9.8.4.2 Directory Record Format

This record describes the size, origin and location of the blocks making up the file. To calculate the block number of a location (ILAT, ILON) use the following formula:

$$IBLOCK = \left( \frac{ILAT - LA}{LAO} \times INBC \right) + \left( \frac{ILON - LO}{LOO} \right) + 1$$

where,

INBC = Number of Column Blocks = 360/LOO,

LA = Latitude origin of file = -90,

LO = Longitude origin of file = -180,

LAO = Size of block in latitudinal direction in degrees = 5,

LOO = Size of block in longitudinal direction in degrees = 5,

ILAT = Latitude (+N, -S) and

ILON = Longitude (+E, -W).

To find INTEGER ILAT and ILON, round up if positive and down if negative. Each block includes the minimum whole latitude and longitude and excludes the maximum whole latitude and longitude which border the block. For example: The limits of block 1 are -90.0 to -85.01 and -180.0 to -175.01.

Table 9.8.4.2-1 contains the format of the directory record.

<b>Table 9.8.4.2-1. Format of Directory Record.</b>		
<b>Halfword</b>	<b>Description</b>	<b>Comments</b>
1	Latitude Origin	-90
2	Longitude Origin	-180
3	Size of block in latitudinal direction	in degrees (currently 5)
4	Size of block in longitudinal direction	in degrees (currently 5)
5	First free record pointer	Points to first available record
6	Number of records in file	Currently 4002
7	Halfword number of start of block directory table	Currently 11
8	Day of year of latest data	1-366
9	File availability	0=available 1=unavailable update in progress
10	Year of century of latest data	0-99
11	Record number for block 1	2-4002
12	Record number for block 2	0 if no data in block

### 9.8.4.3 Data Record Format

Table 9.8.4.3-1 contains the format of the data record.

<b>Table 9.8.4.3-1. Data Record Format.</b>		
<b>Halfword</b>	<b>Description</b>	<b>Comments</b>
1	Record number	2 to 4002
2	Block number	1 to 2592
3	Extent number (# of records) removed from primary	0 if primary

4	Pointer to succeeding overflow record. Last overflow record points to primary.	0 if no overflow.
5	Pointer to halfword position of start of observation data	currently 61
6	Pointer to start of subblock directory	currently 11
7	Lower left latitude of block	degrees
8	Lower left longitude of block	degrees
9	Pointer to last halfword containing data	If no data in the record, this pointer points to the start position of observation data -1
10	Unused	
11	Halfword of start of data for subblock #1	0 if no data for this subblock in this record
12	Halfword of end of data for subblock #1	0 if no data for this subblock in this record. Other extents may or may not contain data for this subblock.
13-60	Similar to halfwords 11 and 12 for remaining subblocks.	Similar to halfwords 11 and 12 for remaining subblocks.
61-6512	Observation data	n/a

If the observations for a block cannot fit in one record, as many additional records (extents) are allocated as needed. Each additional record having the subdirectory and subdocumentation is included. If the subblock is known to be empty for the current record, the start and end position contain a zero. Subblocks may cross record boundaries. If an entire subblock cannot fit into one record, it will be split and a new record is allocated for the remainder of the subblock. Unused portions of the records containing no data are zero filled.

Given IX longitude and IY latitude, the subblock number (SBN) can be calculated as follows:

$$SBN = (IY - LLA) \times LOO + IX - LLL + 1$$

This assumes all subblocks are one degree boxes. Here LLA and LLL are respectively the lower left latitude and longitude for the 5 degree blocks.

Simplifying the above equation:

$$SBN = (IY \times LOO) + IX + C$$

where,

$$C = (-LLA \times LOO) - LLL + 1$$

and has been previously determined.

#### 9.8.4.4 Satellite Aerosol/SST Observation Format

Satellite Aerosol/SST Observations are of variable lengths with a minimum length of 28 halfwords (2-byte integer) and a maximum of 48 halfwords. The observation length must be an even number of halfwords with no odd halfword except the first halfword being negative (i.e. the sign bit is 1). The first odd halfword of an observation is always negative. Table 9.8.4.4-1 gives the format for the observations.

<b>Table 9.8.4.4-1. Satellite Aerosol/SST Observation Format.</b>			
<b>Halfword #</b>	<b>Byte</b>	<b>Quantity</b>	<b>Range</b>
1	1	Type of Observation (see Table 9.8.4.4-2)	129 to 255
1	2	Source of Observation (see Table 9.8.4.4-3)	0 to 255
2	3	Year of Century	0 to 99
2	4	Month of Year	1 to 12
3	5-6	Latitude (+N,-S) x 100	-9000 to 9000
4	7-8	Longitude (+E,-W) x 100	-18000 to 17900
5	9	Day of Month	1 to 31
5	10	Hour of Day	0 to 23
6	11	Minute of Hour	0 to 59
6	12	Second of Minute	0 to 59
7	13-14	Aerosol-corrected SST (degrees C x 10)	-20 to 350
8	15-16	Reliability	0 to 32767
9	17-18	Solar Zenith Angle (degrees x 10)	0 to 1800

10	19-20	Satellite Zenith Angle (degrees x 100) (Negative to left of spacecraft track, positive to right.)	-6000 to 6000
11	21-22	Analyzed Field SST (degrees C x 10)	-20 to 350
12	23-24	Internal Error (RMS x 100)	0 to 1000
13	25-26	Relative Azimuth Angle (degrees x 10)	0 to 1800
14	27-28	Climatological SST (degrees C x 10)	-20 to 350
15	29	Beginning Row of Unit Array	1 to 11
15	30	Beginning column of Unit Array	1 to 11
16	31-32	AVHRR Channel 1 Average (% x 100)	0 to 10000
17	33-34	AVHRR Channel 2 Average (% x 100)	0 to 10000
18	35-36	AVHRR Channel 3 Average (K x 100)	0 to 32767
19	37-38	AVHRR Channel 4 Average (K x 100)	0 to 32767
20	39-40	AVHRR Channel 5 Average (K x 100)	0 to 32767
21	41-42	Space View SDEV Channel 1 (% x 100)	0 to 10000
22	43-44	Space View SDEV Channel 2 (% x 100)	0 to 10000
23	45-46	Space View SDEV Channel 3 (K x 100)	0 to 32767
24	47-48	Channel 4 Blackbody Temperature (K x 100)	0 to 32767
25	49-50	Channel 5 Blackbody Temperature (K x 100)	0 to 32767
26	51-52	Algorithm Number	1011 to ?
27	53-54	Aerosol Optical Thickness x 1000	0 to 2440
28	55-56	Uncorrected SST (K x 100)	27116 to 30816
<b>If HIRS Data is appended:</b>			
29	57-58	HIRS Channel 1 Temperature (K x 100)	0 to 32767
30	59-60	HIRS Channel 2 Temperature (K x 100)	0 to 32767
31	61-62	HIRS Channel 3 Temperature (K x 100)	0 to 32767
32	63-64	HIRS Channel 4 Temperature (K x 100)	0 to 32767

33	65-66	HIRS Channel 5 Temperature (K x 100)	0 to 32767
34	67-68	HIRS Channel 6 Temperature (K x 100)	0 to 32767
35	69-70	HIRS Channel 7 Temperature (K x 100)	0 to 32767
36	71-72	HIRS Channel 8 Temperature (K x 100)	0 to 32767
37	73-74	HIRS Channel 9 Temperature (K x 100)	0 to 32767
38	75-76	HIRS Channel 10 Temperature (K x 100)	0 to 32767
39	77-78	HIRS Channel 11 Temperature (K x 100)	0 to 32767
40	79-80	HIRS Channel 12 Temperature (K x 100)	0 to 32767
41	81-82	HIRS Channel 13 Temperature (K x 100)	0 to 32767
42	83-84	HIRS Channel 14 Temperature (K x 100)	0 to 32767
43	85-86	HIRS Channel 15 Temperature (K x 100)	0 to 32767
44	87-88	HIRS Channel 16 Temperature (K x 100)	0 to 32767
45	89-90	HIRS Channel 17 Temperature (K x 100)	0 to 32767
46	91-92	HIRS Channel 18 Temperature (K x 100)	0 to 32767
47	93-94	HIRS Channel 19 Temperature (K x 100)	0 to 32767
48	95-96	HIRS Channel 20 Temperature (% x 100)	0 to 1000

**Table 9.8.4.4-2. Aerosol/SST Observation Type Codes.**

<b>Code</b>	<b>Type</b>

158	Day Operational Algorithm in relaxed cloud mode
167	Day Test Algorithm
168	Day Test Algorithm in relaxed cloud mode

**Table 9.8.4.4-3. Aerosol/SST Observation Source Codes.**

<b>Code</b>	<b>Source</b>
-------------	---------------

1	NOAA-11 AVHRR
3	NOAA-14 AVHRR
100	Ship data from Navy (FNOC)
101	Buoy data from TIROS collection system
102	Fixed Weather Ship (from NMC)
103	Moving Ship with Name (from NMC)
104	Moving Ship without Name (from NMC)
105	Fixed Buoy (from NMC)
106	Drifting Buoy (from NMC)
107	XBT (from NMC)

#### 9.8.5 AEROSOL OPTICAL THICKNESS 100-KM ANALYZED FIELD ACCUMULATION FILE

Each field accumulation file consists of an archive of one specific type of field (i.e., 100-km aerosol optical thickness). The number of fields archived at any one time depends on the size of the dataset and is given in the directory. In September 2001, the aerosol optical thickness 100-km analyzed field accumulation file which was archived monthly was replaced with an aerosol optical thickness 100-km field file archived weekly. This means that the individual field files are archived and not bundled into an accumulation file for a full month. The format of the individual fields remains the same.

##### 9.8.5.1 File Structure Description

The first record is a directory which points the user to the position of the first record for each field archived. A pointer to the latest field entered in the file is also provided, the user must check each field to find the field for the time period of interest. The fields are concatenated together in one large file after the directory record.

##### 9.8.5.2 Directory Record Format

Table 9.8.5.2-1 contains the format of the Directory Record.

<b>Table 9.8.5.2-1. Directory Record Format.</b>	
<b>Full Word #</b>	<b>Quantity</b>

1	# of records in the dataset
2	# of records in each field (NRECS)
3	# of fields in the accumulation file (NFIELDS)
4	Field number of latest field entered in accumulation file
5	Record # of first record of field #1
6	Record # of first record of field #2
4+NFIELDS	Record # of first record of field # NFIELDS

### 9.8.5.3 Data Record Format

The first field in the accumulation file begins at record 2. Consult the dataset format description for the aerosol optical thickness 100 km analyzed field to find the format of the field documentation record and data records. The field documentation record (the first record of each field) should be used in referencing the data records for the field since the field documentation record provides information concerning the organization, size and time period of the field. The logical record size for a field is 10,108 bytes.

## **9.9 COMPREHENSIVE LARGE ARRAY-DATA STEWARDSHIP SYSTEM (CLASS)**

The Comprehensive Large Array-data Stewardship System (CLASS) is an electronic library of environmental satellite data. CLASS is NOAA's premiere on-line facility for the distribution of NOAA and US Department of Defense (DoD) Polar-orbiting Operational Environmental Satellite (POES) data and derived data products. In addition, CLASS archives and distributes data from NOAA's Geostationary Operational Environmental Satellite (GOES). Note: CLASS has replaced NOAA's Satellite Active Archive (SAA).

The CLASS User Interface is located at: <http://www.class.noaa.gov>

## **APPENDIX A: APT PREDICT (TBUS) BULLETIN**

### APT Predict (TBUS) Bulletin Code

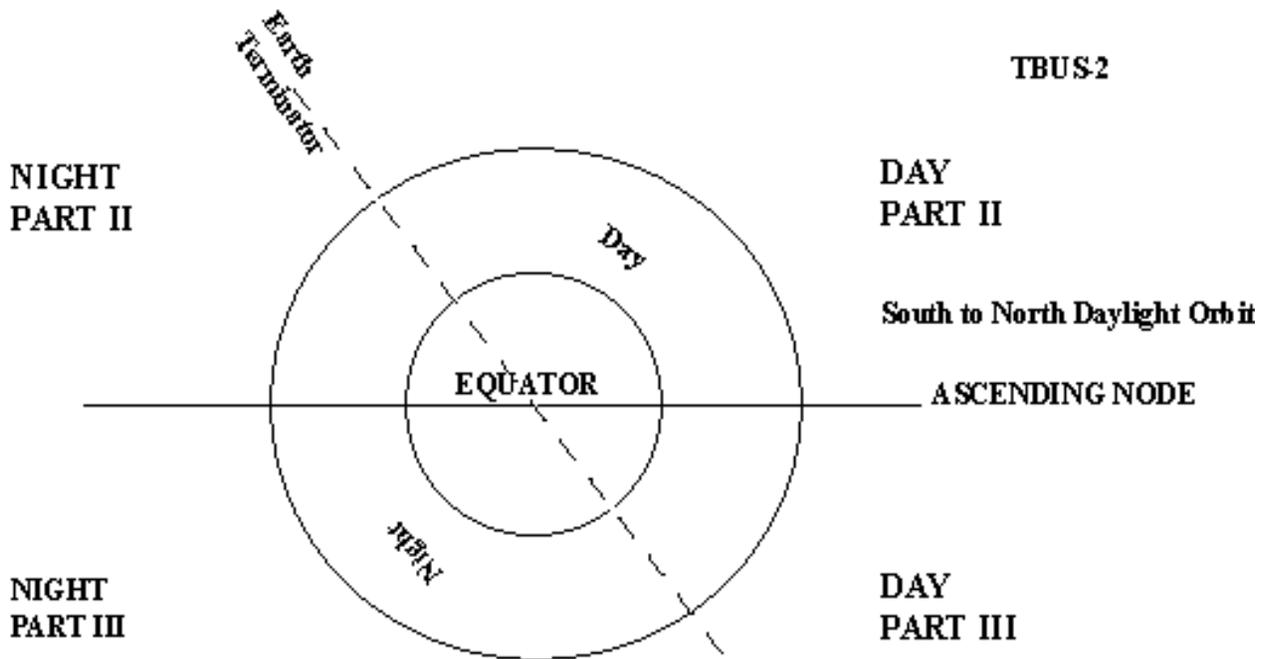

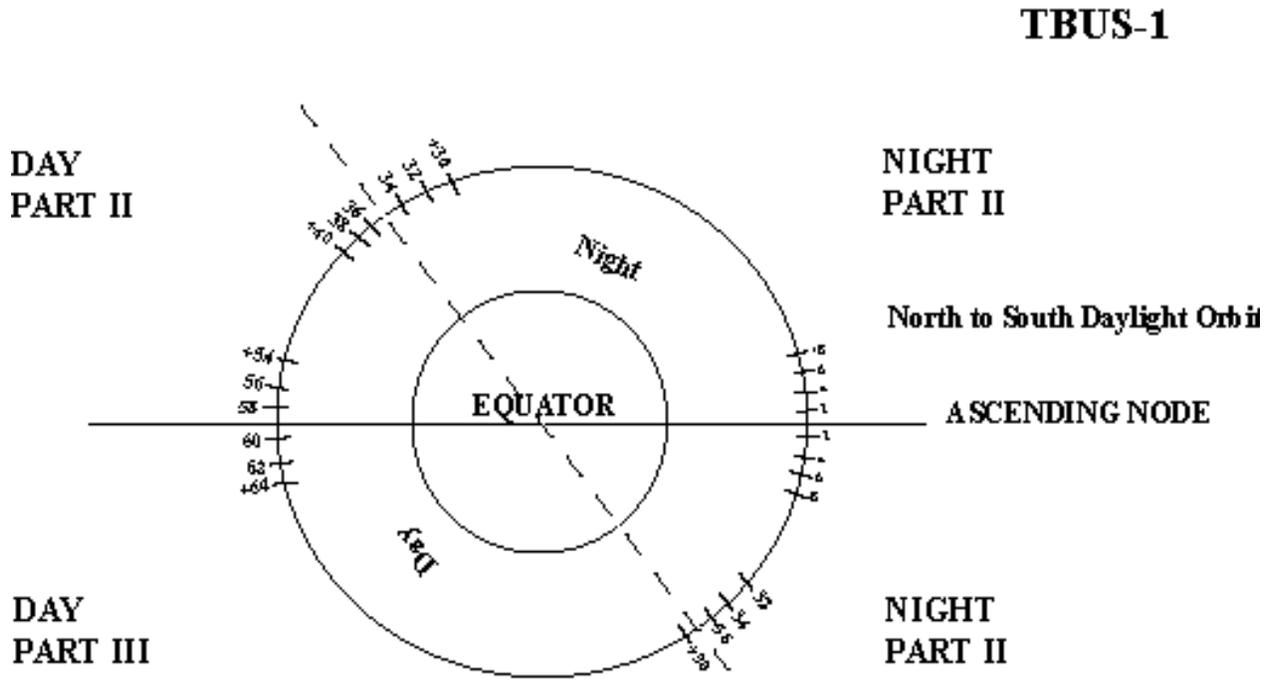

The TBUS is a national practice code form used by the United States to transmit information for predicting the path or locating the position of polar orbiting environmental satellites. It is transmitted daily, at about 1900Z, by KWBC Washington, DC, on the Global Telecommunications Service network.

The TBUS-1 code form is used to convey information about satellites that are descending in daylight (i.e., north to south direction of travel in daytime), while the TBUS-2 code form relates to satellites that are ascending in daylight (south to north). Figure A-1 shows a schematic of the information given in TBUS-1 and TBUS-2 bulletins.

This appendix contains the code forms for TBUS-1 and TBUS-2, a list of the satellite identifiers used in TBUS messages, an explanation of code symbols, samples of an APT Predict (TBUS) bulletin and a Two Line Element message, and how they can be decoded properly.

Table A-1 contains the code symbols for the Heading and Parts I-III of the TBUS message.

Figure A-1. Schematic Representation of Information Conveyed in TBUS-1 and TBUS-2.

<b>Table A-1. Code Symbols for Heading and Parts I-III.</b>	
<b>Code Symbol</b>	<b>Meaning</b>
MM	Month
DD	Day
SS	Satellite (see Table A-2)
NNNN	Orbit number
HH	Hour
mm	Minutes
ss	Seconds
Q	Octant of Globe (see Figure A.3-1)
LoLo	Longitude (tens and units)
lolo	Longitude (tenths and hundredths)
T	Group indicator (orbital period)
L	Group indicator (nodal period)
aa	Altitude in hundreds and tens of kilometers
La	Latitude (tens)
la	Latitude (tenths)

Table A-2 contains the numbers used in TBUS bulletins to identify the satellite.

<b>Table A-2. Satellite Identifier in TBUS Bulletins.</b>	
<b>Numbers</b>	<b>Meaning</b>
10 - 19	ITOS series satellites
20 - 29	SMS/GOES series satellites
30	TIROS-N
31	NOAA-6
32	NOAA-7
33	NOAA-8
34	NOAA-9
35	NOAA-10
36	NOAA-11
37	NOAA-12
38	NOAA-14
34	NOAA-15
36	NOAA-16
37	NOAA-17
39	NOAA-18
40	NOAA-19

## **A.3 EXPLANATION OF CODE SYMBOLS**

Table A.3-1 contains an explanation of the code symbols used for all parts of the TBUS-1 and TBUS-2 Predict messages.

<b>Table A.3-1. Explanation of Code Symbols.</b>	
<b>Symbol</b>	<b>Explanation</b>
TBUS-1 (or TBUS-2)	APT Bulletin originating in the United States: TBUS-1 is North to South (descending) daylight orbit. TBUS-2 is South to North (ascending) daylight orbit.
KWBC	Traffic entered at Washington, D.C.
APT PREDICT	Identifies message content.
MMDDSS	Message serial number MM - Month DD - Day of Month SS - Number of spacecraft to which predict applies (See Table A-1).
<b>PART I - Equator crossing reference information follows:</b>	
0	Code group indicator for first three groups
NrNrNrNr	Number of reference orbit. (Note: Information in Parts II and III also are related to this reference orbit.)
DrDrHrHrmmrsrs r	Reference orbit equator crossing time (GMT), satellite northbound: DrDr - Day of Month HrHr - Hour mm - Minute rsrs - Second
<b>Note:</b> In TBUS-1, northbound equator crossing takes place on NIGHT side of orbit. In TBUS-2, northbound equator crossing takes place on DAY side of orbit.	
Qr	Octant satellite is entering after crossing equator on reference orbit (See Appendix B).
LoLololo	Reference orbit equator crossing longitude in degrees and hundredths.
T	Indicator: nodal period follows (will always be shown as "T").
mm	Nodal period, minutes
ss	Nodal period, seconds. [Note: Hundreds group will not be included. example: 100 minutes 13 seconds will be coded as 0013.
L	Indicator, nodal longitude increment follows (always shown as "L").
LoLololo	Degrees and hundredths of degrees longitude between successive equator crossings.
N4N4N4N4	Orbit number of fourth orbit following reference orbit.
H4H4	Hour of northbound satellite equator crossing four orbits after reference orbit.
m4m4	Minute
s4s4	Second
Q4	Octant satellite is entering after crossing equator on fourth orbit after reference orbit.
LoLololo	Equator crossing longitude of fourth orbit after reference orbit.
Above information is repeated for eighth (N8N8N8N8) and twelfth (N12N12N12N12) orbits following reference orbit.	
NIGHT PART II (TBUS-1) or DAY PART II (TBUS-2): Contains satellite altitude and	

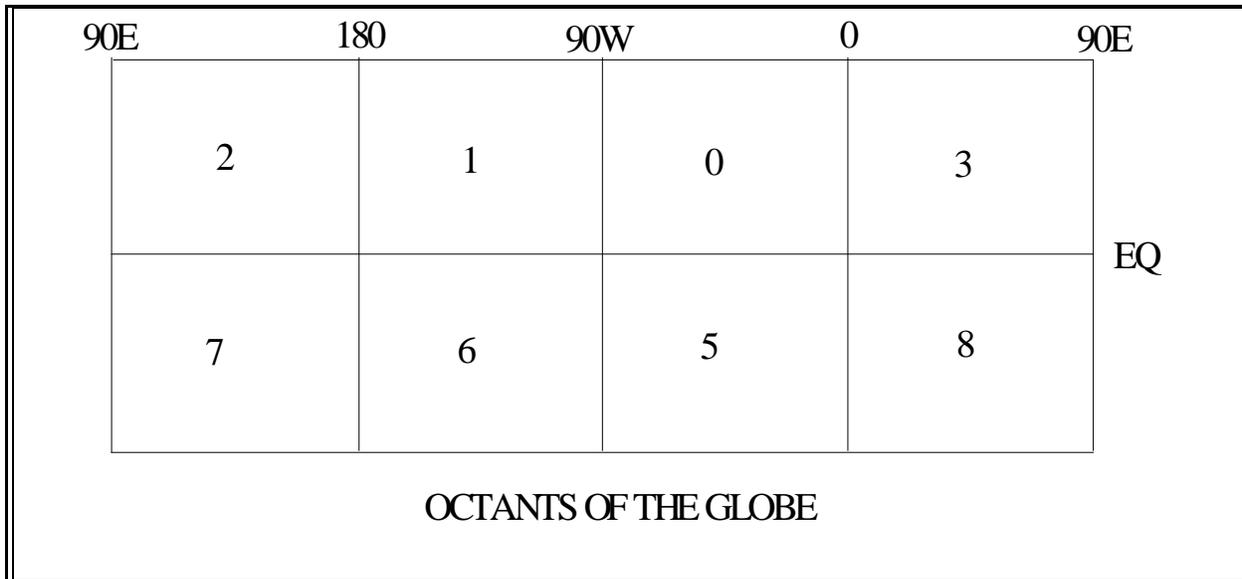

subpoint coordinates at two-minute intervals after time of equator crossing; satellite northbound.	
02	Indicator; satellite altitude and subpoint coordinates at two minutes after time of equator crossing.
a02a02	Altitude, in hundreds and tens of kilometers, at two minutes after equator crossing. Thousands figure understood; hence 1440 km is encoded as 44.)
Q02	Octant of globe at two minutes after equator crossing.
LaLala	Latitude of satellite subpoint in degrees and tenths of degrees at two minutes after equator crossing.
LoLolo	Longitude of satellite subpoint in degrees and tenths of degrees at two minutes after equator crossing.
Above information is repeated at two-minute intervals over the NIGHT portion of the orbit north of the equator for TBUS-1, and DAY portion of the orbit north of the equator for TBUS-2.) Note: Should the time after ascending node become greater than 99, the hundreds will be assumed (example, minute 102 will be encoded as 02).	
NIGHT PART III (TBUS-1) or DAY PART III (TBUS-2): Satellite altitude and subpoint coordinates at two-minute intervals south or equator on the ascending side of the orbit.	
02	Indicator; satellite altitude and subpoint coordinates at two minutes after time of equator crossing follows.
a02a02	Satellite altitude in hundreds and tens of kilometers at two minutes after equator crossing.
Q02	Octant of globe at two minutes after equator crossing.
LaLala	Latitude of satellite subpoint in degrees and tenths of degrees at two minutes after crossing.
L0L010	Longitude of satellite subpoint in degrees and tenths of degrees at two minutes after equator crossing.
Above information is repeated at two-minute intervals over the night portion of the orbit south of the equator for TBUS-1, and sunlight portion of the orbit north of the equator for TBUS-2.	
DAY PART II (TBUS-2) NIGHT PART II (TBUS-1): Satellite altitude and subpoint coordinates at two-minute intervals after time of equator crossing follows.	
02	Information pertinent to 02 minutes after equator crossing follows.
a02a02	Satellite altitude in hundreds and tens of kilometers at 02 minutes after equator crossing.
Q02	Octant of globe at 02 minutes after equator crossing.
LaLala	Latitude of satellite subpoint in degrees and tenths of degrees at 02 minutes after equator crossing.
L0L010	Longitude of satellite subpoint in degrees and tenths of degrees at 02 minutes after equator crossing.
Above information is repeated at two-minute intervals over the sunlit portion of the orbit north of the equator for TBUS-2, and night portion of the orbit north of the equator for TBUS-1.	
DAY PART III (TBUS-1) or NIGHT PART III (TBUS-2): Satellite altitude and subpoint coordinates at two-minute intervals south of the equator on the descending side of the orbit.	
02	Indicator: satellite altitude and subpoint coordinates at two minutes after

	time of equator crossing.
a02a02	Satellite altitude in tens of kilometers at two minutes after equator crossings.
Q02	Octant of globe at two minutes after equator crossing.
LaLala	Latitude of satellite subpoint in degrees and tenths of degrees at two minutes after equator crossing.
L0L010	Longitude of satellite subpoint in degrees and tenths of degrees at two minutes after equator crossing.
Above information is repeated at two-minute intervals over the sunlit portion of the orbit south of the equator for TBUS-1 and night portion of the orbit south of the equator for TBUS-2. Note: Should the time after ascending node become greater than 99, the hundreds will be assumed (example, minute 102 will be encoded as 02).	
PART IV: Contains high precision orbital elements transmission frequencies, and remarks - See Table A.3-2.	

In Table A.3-2, the classical elements (Keplerian) from MMMMMMMM to RRRRRRRR are Brouwer mean (BM) elements expressed in the form of Keplerian elements. The position and velocity components SSSSSSSS to XXXXXXXX are instantaneous. The Greenwich Hour Angle is apparent sidereal time.

<b>Table A.3-2. Part IV Code Symbols.</b>	
<b>Symbol</b>	<b>Explanation</b>
AAAAAAAAAA	Spacecraft identification (International designator)
BBBBB	Orbit number at epoch.
CCCCCCCCCCC	Time of the first ascending node, in days, from the beginning of the year, to nine decimal places.
DD	Epoch year
EE	Epoch month
FF	Epoch day
GG	Epoch hour
HH	Epoch minute
IIII	Epoch second, to three decimal places
JJJJJJ	Apparent Greenwich Hour Angle at Aries at epoch, to four decimal places.
KKKKKKKK	Anomalistic period (minutes), to four decimal places.
LLLLLLLL	Nodal period (minutes), to four decimal places.
MMMMMMMM	BM Eccentricity, eight decimal places.
NNNNNNNN	BM Argument of perigee (degrees), five decimal places.
OOOOOOOO	BM Right Ascension of the ascending node (degrees), five decimal places.
PPPPPPP	BM Inclination (degrees), five decimal places.
QQQQQQQQ	BM Mean anomaly (degrees), five decimal places.
RRRRRRRR	BM Semi-major axis (km), three decimal places.
Note: All signed values in Part IV are preceded by a "P" or "M" to denote a plus (+) or minus	

(-) value.	
SSSSSSSSSS	Sign and epoch X position component (km), to four decimal places.
TTTTTTTTTT	Sign and epoch Y position component (km), to four decimal places.
UUUUUUUUUU	Sign and epoch Z position component (km), to four decimal places.
VVVVVVVVVV	Sign and epoch X velocity (Xdot) component (km/sec), to six decimal places.
WWWWWWWW	Sign and epoch Y velocity (Ydot) component (km/sec), to six decimal places.
XXXXXXXXXX	Sign and epoch Z velocity (Zdot) component(km/sec), to six decimal places.
YYYYYYYYYY	Ballistics coefficient CD-A/M (m <sup>2</sup> /kg), to eight decimal places.
ZZZ	Daily solar flux value (10.7 cm) 10 <sup>-7</sup> W/m <sup>2</sup> .
aaa	90-day running mean of solar flux 10 <sup>-7</sup> W/m <sup>2</sup> .
bbb	Planetary magnetic index (2x10 <sup>-5</sup> gauss).
cccc	Drag modulation coefficient, to four decimal places.
dddddddddd	Radiation pressure coefficient (m <sup>2</sup> /kg), to ten decimal places.
eeeeeeeeee	Sign and perigee motion (degrees/day), to five decimal places.
fffffffff	Sign and motion of Right Ascension of the ascending node (degrees/day), to five decimal places.
gggggggggg	Sign and rate of change of mean anomaly at epoch (degrees/day), to two decimal places.
hhhhhhhh	Equator crossing longitude of the epoch reference orbit measure as East longitude, to five decimal places.
iiiiii	Month, date and year (MMDDYY) of last TIP clock correction.
jjjjj	Sign and clock error after last correction measured in seconds, to three decimal places. *
kkkkkk	Month, date and year (MMDDYY) of current clock error.
lllll	Sign and current clock error measured in seconds, to three decimal places. *
mmmmmm	Month, date and year (MMDDYY) of the measured clock error rate.
nnnnnn	Sign and clock error rate expressed as milliseconds/day. *
oooooo	Month, date and year (MMDDYY) of next TIP clock correction. (000000 if unknown.)
* These will be set to 99999 if the value is unknown. Note: All signed values in Part IV are preceded by a “P” or “M” to denote a plus (+) or minus (-) value.	

**Figure A.3-1. Global Octant Map**

**A.4 SAMPLE APT PREDICT (TBUS) BULLETIN**

The following encoded APT Predict (TBUS) Bulletin example is referred to throughout the remaining sub-appendices. The major features of the message are decoded in Table A.5-1.

**A.5 DECODING EXERCISE**

<b>Table A.5-1. Decoding Exercise of Sample APT Predict (TBUS) Bulletin from Section A.4.</b>	
<b>Line from TBUS</b>	<b>Explanation</b>
TBUS2 KWBC 271900	
TBUS2	Bulletin heading--identifies bulletin for satellite northbound in daylight
KWBC	Bulletin source--Washington, D.C. Communications Center
271900	27 -Day of the month (21st) 1900 -Bulletin time (1900 UTC)
APT PREDICT	Bulletin identifier
<b>022737 NOAA 12</b>	
022737	0227 - Date for which bulletin applies, Feb. 27 37 - Satellite identifier (Table A-2)
NOAA 12	Plain language satellite identifier
PART I	Identifies reference orbit information and the equator crossing time and equator crossing longitude for the fourth, eighth and twelfth orbits after the reference orbit.
<b>05271 02718 05148 01022 T0115 L2531</b>	
05271	0 - Group indicator 5271 - Reference orbit number

02718	0 - Group indicator 27 - Day of month of equator crossing 18 - Hour
05148	0 - Group indicator 51- Minute 48 - Seconds (equator crossing 18:51:48 UTC)
01022	0 - Octant 0 (0 to 90W degrees), N. Hemisphere 1022 - 010.22W (equator crossing)
T0115	T - Group indicator 0115 - Orbital period 101 minutes 15 seconds
L2531	L - Group indicator 2531 - Nodal longitudinal increment 25.31 degrees
<b>52750 13652 11149</b>	
52750 13652	5275 - Orbit number 5275 (4th orbit after reference orbit) 013652 - Time (01:36:52Z) of ascending node for orbit 5275
11149	1 - Octant 1 (90W to 180 degrees) 1149 - 111.49W (equator crossing for orbit 5275 in octant 1)
52790 82156 24723	Decoded in same manner as previous line of data
52831 50700 34596	Decoded in same manner as previous line of data
NIGHT PART II	Satellite altitude and subpoint coordinates at two-minute intervals beginning at the day/night terminator in the N. Hemisphere and continuing southward toward the equator.
<b>02810 070117 04820 141133</b>	
02810	02 - Minute 02 after northbound equator crossing 81 - Spacecraft altitude 810 km 0 - Octant 0 (0 - 90W degrees) N. Hemisphere
070117	070 - Latitude 7.0N 117 - Longitude 11.7E
04820	04- Minute 04 after equator crossing 82 - Spacecraft altitude 820 km 0 - Octant 0 (0 - 90W degrees) N. Hemisphere
141133	141 - Latitude 14.1N 133 - Longitude 13.3E
Remainder of NIGHT PART II decoded in same manner. Data continues at 2 minute intervals.	
NIGHT PART III	Satellite altitude and subpoint coordinates at two-minute intervals south of the equator on the descending side of the orbit.
<b>02815 070086 04815 141070</b>	
02815	02 - Minute 02 after Northbound equator crossing 81 - Spacecraft altitude 810 km 5 - Octant 5 (0 - 90W degrees) S Hemisphere
070086	070 - Latitude 07.0S 086 - Longitude 08.6E

04815	04 - Minute 04 after equator crossing 81 - Spacecraft altitude 810 km 5 - Octant 5 (0 -90W degrees) S Hemisphere	
141070	141 - Latitude 14.1S 070 - Longitude 7.0E	
Remainder decoded in same manner. Data continues at 2-minute intervals from first point South of equator to Southern terminator.		
DAY PART II	Contains satellite altitude and subpoint coordinates at two-minute intervals after time of Northbound (ascending) equator crossing.	
<b>32831 649795 34832 582752</b>		
32831	32 - Minute 32 after Northbound equator crossing 83 - Spacecraft altitude 830 km 1 - Octant 1 (90W to 180W degrees) N. Hemisphere	
649795	649 - Latitude 64.9N 795 - Longitude 079.5W	
34832	34 - Minute 34 after Northbound equator crossing 83 - Spacecraft altitude 830 km 2 - Octant 2 (90E to 180E) N. Hemisphere	
582752	582 - Latitude 058.2N 752 - Longitude 75.2W	
Remainder of DAY PART II decoded in same manner. Data for DAY PART II are continuous at 2-minute intervals from equator North to Northern terminator.		
DAY PART III	Satellite altitude and subpoint coordinates at two-minute intervals south of the equator. Satellite Northbound in the Southern hemisphere (points are plotted Southward from the equator).	
<b>52817 048560 54817 118544</b>		
52817	52 - Minute 52 before Northbound equator crossing 81 - Spacecraft altitude 810 km 7 - Octant 7 (90E to 180E degrees) S. Hemisphere	
048560	048 - Latitude 04.8S 560 - Longitude 056.0W	
54817	54 - Minute 54 after equator crossing 81 - Spacecraft altitude 810 km 7 - Octant 7 (90E to 180E degrees) S. Hemisphere	
118544	118 - Latitude 11.8S 544 - Longitude 54.4W	
Remainder of DAY PART III decoded in same manner		
PART IV	Indicator -- orbital elements, transmission frequencies, and remarks follow.

### A.6 NASA TWO LINE ORBITAL ELEMENTS (TLE)

A description of the NASA prediction bulletin's two line, orbital element set format is explained in the following example.

Data for each satellite consists of three lines (two of which contain actual orbital elements) in the following format:

AAAAAAAAAAAAAAAAAAAAAAAAA

1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N  
NNNNN

2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN  
NN.NNNNNNNNNNNNNNN

Line 0 is a twenty-two-character name. Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by USSC and NASA. The format is described in Table A.6-1.

<b>Table A.6-1. Format of Standard Two-Line Orbital Element Set.</b>	
<b>Column</b>	<b>Description</b>
<b>Line 1</b>	
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year). See Table A.6-2.
12-14	International Designator (Launch number of the year). See Table A.6-2.
15-17	International Designator (Piece of launch). See Table A.6-2.
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element Number
69-69	Check Sum (Modulo 10)
<b>Line 2</b>	
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination (degrees)
18-25	Right Ascension of the Ascending Node (degrees)
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee (degrees)
44-51	Mean Anomaly (degrees)
53-63	Mean Motion (revolutions per day)
64-68	Revolution number at epoch (revolutions)
69-69	Check Sum (Modulo 10)
<b>Note:</b> All other columns are blank or fixed.	

<b>Table A.6-2. Definition of Satellite ID and International Designator.</b>

### A.7 EXAMPLE OF DECODED TWO LINE ORBITAL ELEMENT MESSAGE

The following is an example of a two-line orbital element message:

```
NOAA 14
1 23455U 94089A 95222.82483495 .00000053 00000-0 53646-4 0 2755
2 23455 98.9047 164.9161 0010620 42.0812 318.1174 14.11526152 31526
```

This example has been decoded in Table A.7-1.

NOAA-14	Satellite name ANOAA-14"
1 23455U	1 - Message line 1 23455 - Satellite number 23455
94089A	94 - Launch year 1994 089 - Launch number 89 A - Launch piece A (not in multiple pieces)
95222.82483495	95 - Epoch year 1995 222.82483495 - Julian day 222 and fraction
.00000053	First time derivative of the mean motion (plus sign implied)
00000-0	Second time derivative of the mean motion
53646-4	BSTAR drag term
0	Ephemeris type zero
2755	Element number 275 5 - Check sum
2 23455	2 - Message line 2 223455 - Satellite number 23455 (repeated)
98.9047	Orbit inclination 98.9047 degrees
164.9161	Right ascension of ascending node 164.9161 degrees

0010620	Eccentricity .0010620
42.0812	Argument of perigee 042.0812 degrees
318.1174	Mean anomaly 318.1174 degrees
14.11526152	Mean motion 14.11526152 revolutions per day
31526	3152 - Satellite revolution 3152 at epoch 6 - Check sum

## **APPENDIX B: USING BROUWER-MEAN ELEMENTS FROM TBUS PART IV**

The Brouwer-mean elements in part IV of the APT predict bulletin (TBUS) can be used in a stand-alone Brouwer-Lyddane orbit prediction package to determine orbit position information at any time  $(t-t_0)$  where  $t_0$  represents the time of the Brouwer mean elements in part IV and  $t$  represents the user request time. The Brouwer-Lyddane algorithm is an analytical solution of satellite motion for a simplified disturbing potential field limited to zonal harmonic coefficients for  $J_2$  through  $J_5$ . Lyddane modified Brouwer's formulation to obtain algorithms applicable for zero eccentricity and zero inclination.

The Brouwer-Lyddane orbit prediction package contains seven subroutines and one block data subprogram which can be called from a user supplied driver to obtain orbit information in the form desired by the user.

The first subroutine to be called is BROLYD. This subroutine takes as input the Brouwer mean or osculating elements at time  $t_0$ , and outputs the osculating Keplerian and Brouwer mean elements at the time  $(t-t_0)$  given in common block BLCNST. The calling sequence for subroutine BROLYD is described below.

If users require output in the form of inertial position and velocity vectors then a second subroutine CELEM can be called. This subroutine takes as input the osculating Keplerian elements for BROLYD and outputs the inertial position and velocity vectors. The calling sequences for subroutine CELEM is also described below.

A third subroutine, BFIXED, transforms the position and velocity vectors from CELEM to earth fixed coordinates. The user must supply the Greenwich hour angle to this subroutine.

Subroutine XYZPLH converts the position vector in the earth fixed coordinates to geodetic latitude, east longitude, and height.

Three other subroutines are included in this prediction package. These are DKEPLR, MA3331, and DATAN0. DKEPLR is a subroutine to solve Kepler's equation. MA3331 computes the product of a 3X3 matrix and a 3X1 matrix. DATAN0 computes a value for the arc-tangent between 0 and  $2\pi$ .

A block data subprogram for the common block BLCNST includes several constants needed by the stand-alone orbit prediction package. These constants are described below and are presently used in NESDIS's polar navigation system.

CALLING SEQUENCE FOR SUBROUTINE BROLYD:

CALL BROLYD (OSCELE, DPELE, IPERT, IPASS, IDMEAN, ORBEL)

ARGUMENTS:

OSCELE - OUTPUT OSCULATING ELEMENTS AT TIME TTO

OSCELE (1) = SEMI-MAJOR AXIS  
OSCELE (2) = ECCENTRICITY  
OSCELE (3) = INCLINATION  
OSCELE (4) = NODE  
OSCELE (5) = ARGUMENT OF PERIGEE  
OSCELE (6) = MEAN ANOMALY

DPELE - INPUT IS OSCULATING ELEMENTS AT EPOCH IF IDMEAN = 0  
INPUT IS BROUWER MEAN AT EPOCH IF IDMEAN  $\neq$  0  
OUTPUT ELEMENTS ARE BROUWER MEAN AT TIME TTO

DPELE (1) = SEMI-MAJOR AXIS  
DPELE (2) = ECCENTRICITY  
DPELE (3) = INCLINATION  
DPELE (4) = NODE  
DPELE (5) = ARGUMENT OF PERIGEE  
DPELE (6) = MEAN ANOMALY

IDMEAN - DETERMINES WHICH ELEMENTS ARE INPUT IN DPELE  
= 0, OSCULATING  
 $\neq$  0, BROUWER MEAN

IPASS =1, COMPUTE CONSTANTS NEEDED IN COMPUTATION OF OSCULATING ELEMENTS  
=2, UPDATE OSCULATING ELEMENT TO OBSERVATION TIME WITHOUT UPDATING CONSTANTS

IPERT =0, NO PERTURBATIONS DUE TO OBLATENESS COMPUTED  
=1, SECULAR TERMS COMPUTED  
=2, SECULAR + LONG PERIODIC + SHORT PERIODIC TERMS

ORBEL - OUTPUT AUXILIARY ORBITAL ELEMENTS

CALLING SEQUENCE FOR SUBROUTINE CELEM:

CALL CELEM (ORBEL, GMC, PV, VV)

ARGUMENTS:

ORBEL - INPUT OSCULATING ELEMENTS

ORBEL (1) = SEMI-MAJOR AXIS

ORBEL (2) = ECCENTRICITY

ORBEL (3) = INCLINATION

ORBEL (4) = NODE

ORBEL (5) = ARGUMENT OF PERIGEE

ORBEL (6) = MEAN ANOMALY

GMC - INPUT GRAVITATIONAL CONSTANT

PV - OUTPUT CARTESIAN POSITION VECTOR

PV (1) = X

PV (2) = Y

PV (3) = Z

VV - OUTPUT CARTESIAN VELOCITY VECTOR

VV (1) = XDOT

VV (2) = YDOT

VV (3) = ZDOT

COMMON BLOCK BLCNST

COMMON/BLCNST/TTO, R, AE, GM, BJ2, BJ3, BJ4, BJ5, FLTINV, XKE, ESQ

VARIABLES USED IN COMMON/BLCNST/:

TTO - INPUT REQUEST TIME IN SECONDS FROM EPOCH

R - OUTPUT MAGNITUDE OF SATELLITE RADIUS VECTOR

AE - INPUT MEAN EQUATORIAL RADIUS OF THE EARTH (KM)

GM - INPUT GRAVITATIONAL CONSTANT OF THE EARTH (KM<sup>3</sup>/SEC<sup>2</sup>)

BJ2 - INPUT C<sub>2,0</sub> ZONAL HARMONIC COEFFICIENT

BJ3 - INPUT C<sub>3,0</sub> ZONAL HARMONIC COEFFICIENT

BJ4 - INPUT C<sub>4,0</sub> ZONAL HARMONIC COEFFICIENT

BJ5 - INPUT C<sub>5,0</sub> ZONAL HARMONIC COEFFICIENT

FLTINV - INPUT INVERSE FLATTENING COEFFICIENT (1/F)

XKE - GRAVITATIONAL CONSTANT (EARTH RADII)<sup>3/2</sup>/MIN)

ESQ - THE SQUARE OF THE MAJOR ECCENTRICITY CALCULATED FROM  
 $e^2=(2f-f^2)$

## APPENDIX C: POLAR STEREOGRAPHIC EARTH LOCATION

Two subroutines are provided for Earth location/navigation for NESDIS Operational Products that are mapped onto a polar stereographic map base. These subroutines provide the capability of converting the line, sample location of a data point on the polar stereographic base to latitude and longitude (IJTOLL) or the reverse (LLTOIJ). With proper specification of the input parameters, these subroutines may be used in conjunction with the following:

1. Radiation Budget Products (except Mercator)
2. Mapped GAC Products (except Mercator)
3. Vegetation Index Data

### C.1 INTRODUCTION

Subroutines IJTOLL and LLTOIJ are very similar in structure to each other. They are described together where possible to avoid repetition. IJTOLL converts the i and j coordinates of a point to latitude and longitude, whereas LLTOIJ converts the latitude and longitude of a point to the i and j coordinates. Both require the origin of the map to be in the upper left corner. Several parameters must be input in order to tailor IJTOLL and LLTOIJ to a specific user's needs. Both subroutines have identical variables in their argument lists. These variables are defined in Table C-1.

<b>Table C-1. Subroutines IJTOLL and LLTOIJ Argument list.</b>	
<b>Argument</b>	<b>Definition</b>
PRMLON	The prime longitude of the polar stereographic map base. This is defined as the meridian which is perpendicular to the base of the map and which goes from the pole to the bottom of the map. The map may be oriented as desired. The prime longitude can be expressed as either positive 0-360W or positive 0-180W and negative 0-180E.
SCALE	The number of desired grid points between the pole and the equator.
CENTI	The i coordinate representing the center of the array.
CENTJ	The j coordinate representing the center of the array.
RI	The i coordinate of the point to be converted.
RJ	The j coordinate of the point to be converted.
PNTLAT	The latitude of the point written as positive 0-90N or negative 0-90S.
PNTLON	The longitude of the point written as either positive 0-360W or positive 0-180W and negative 0-180E.
<b>Note:</b> IJTOLL has RI and RJ for inputs with the corresponding PNTLAT and PNTLON as outputs, and LLTOIJ uses PNTLAT and PNTLON as inputs to calculate the resultant RI and RJ as outputs.	

## C.2 PROGRAM OPERATION

Subroutine IJTOLL computes the angle between the horizontal and a line drawn from the pole to the point. From this angle and the prime longitude, the longitude of the point is obtained. IJTOLL also computes the latitude angle using various ratios and some simple trigonometry.

The equations governing the relation between i and j coordinates and latitude and longitude follow.

The distance from the point to the pole (in units of grid points) was derived from the Pythagorean theorem and is defined as:

$$POLDIS = \sqrt{|CENTRI - RI|^2 + |CENTJ - RJ|^2}$$

The angle (in degrees) governing the latitude can easily be derived using the diagram of the Earth's cross-section in Figure C-1, and is defined as:

$$ANG1 = \theta = \arctan\left(\frac{POLDIS}{SCALE}\right)$$

Figure C-1. Definition of latitude angle.

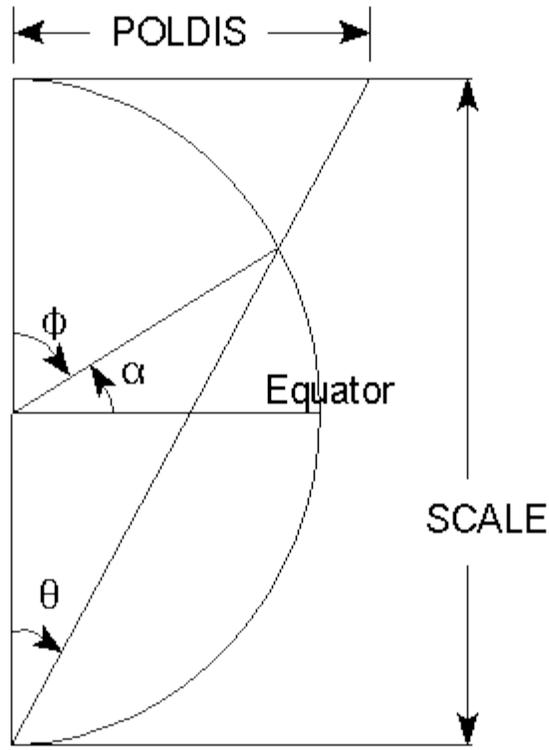

Figure C-1. Definition of latitude angle.

The angle (in degrees) governing the longitude is also easily derived from the diagram of a polar stereographic map and the *i, j* coordinates array in Figure C-2, and is defined as:

$$ANG2 = \arccos\left(\frac{(CENTJ - RJ)}{POLDIS}\right)$$

Figure C-2. Definition of longitude angle.

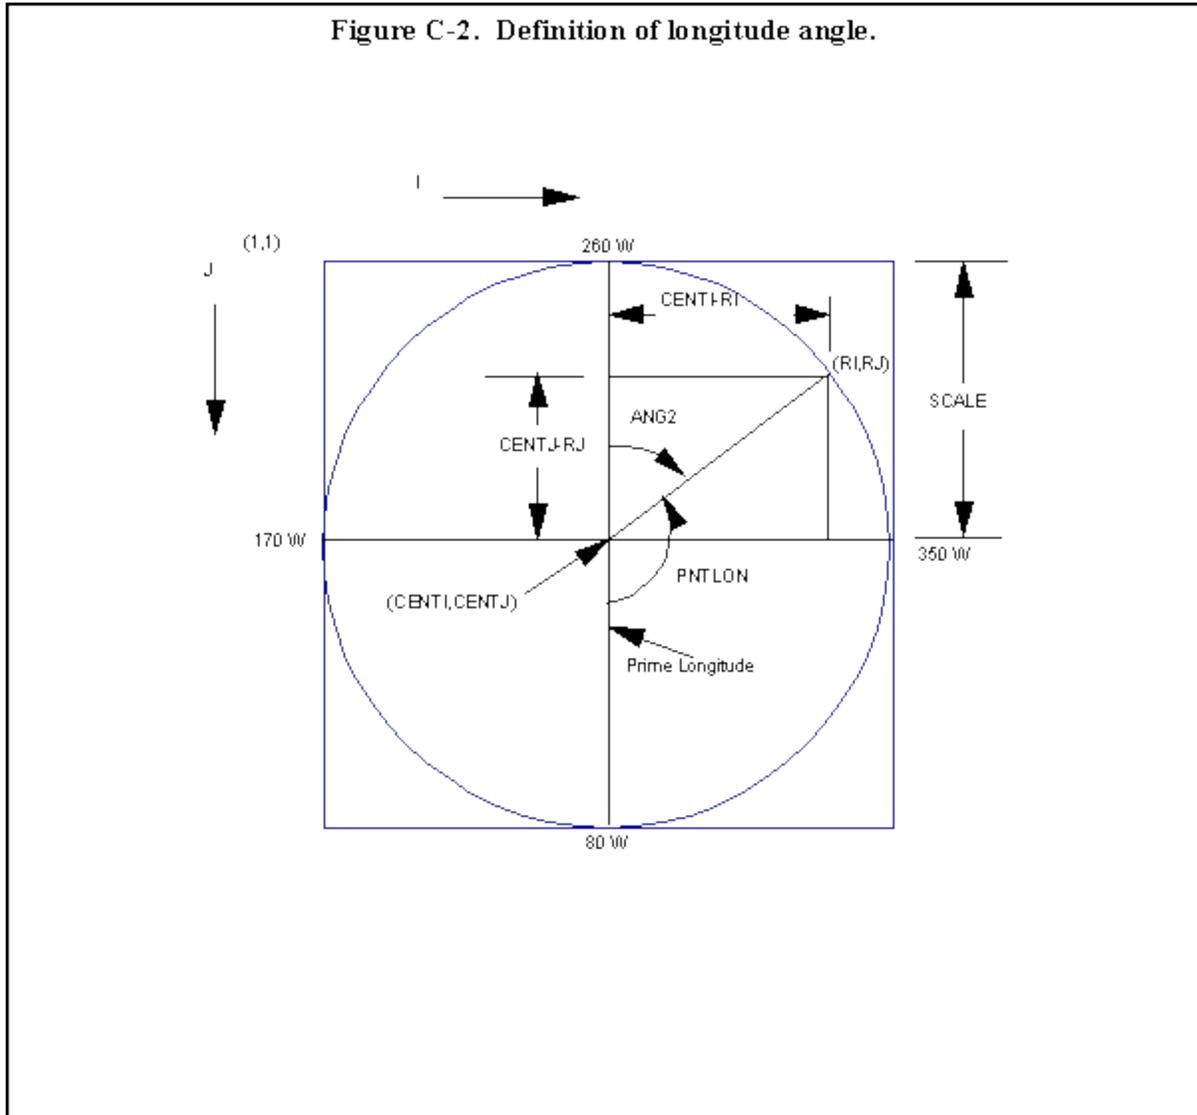

Figure C-2. Definition of longitude angle.

Thus, from Figure C-1, the latitude is:

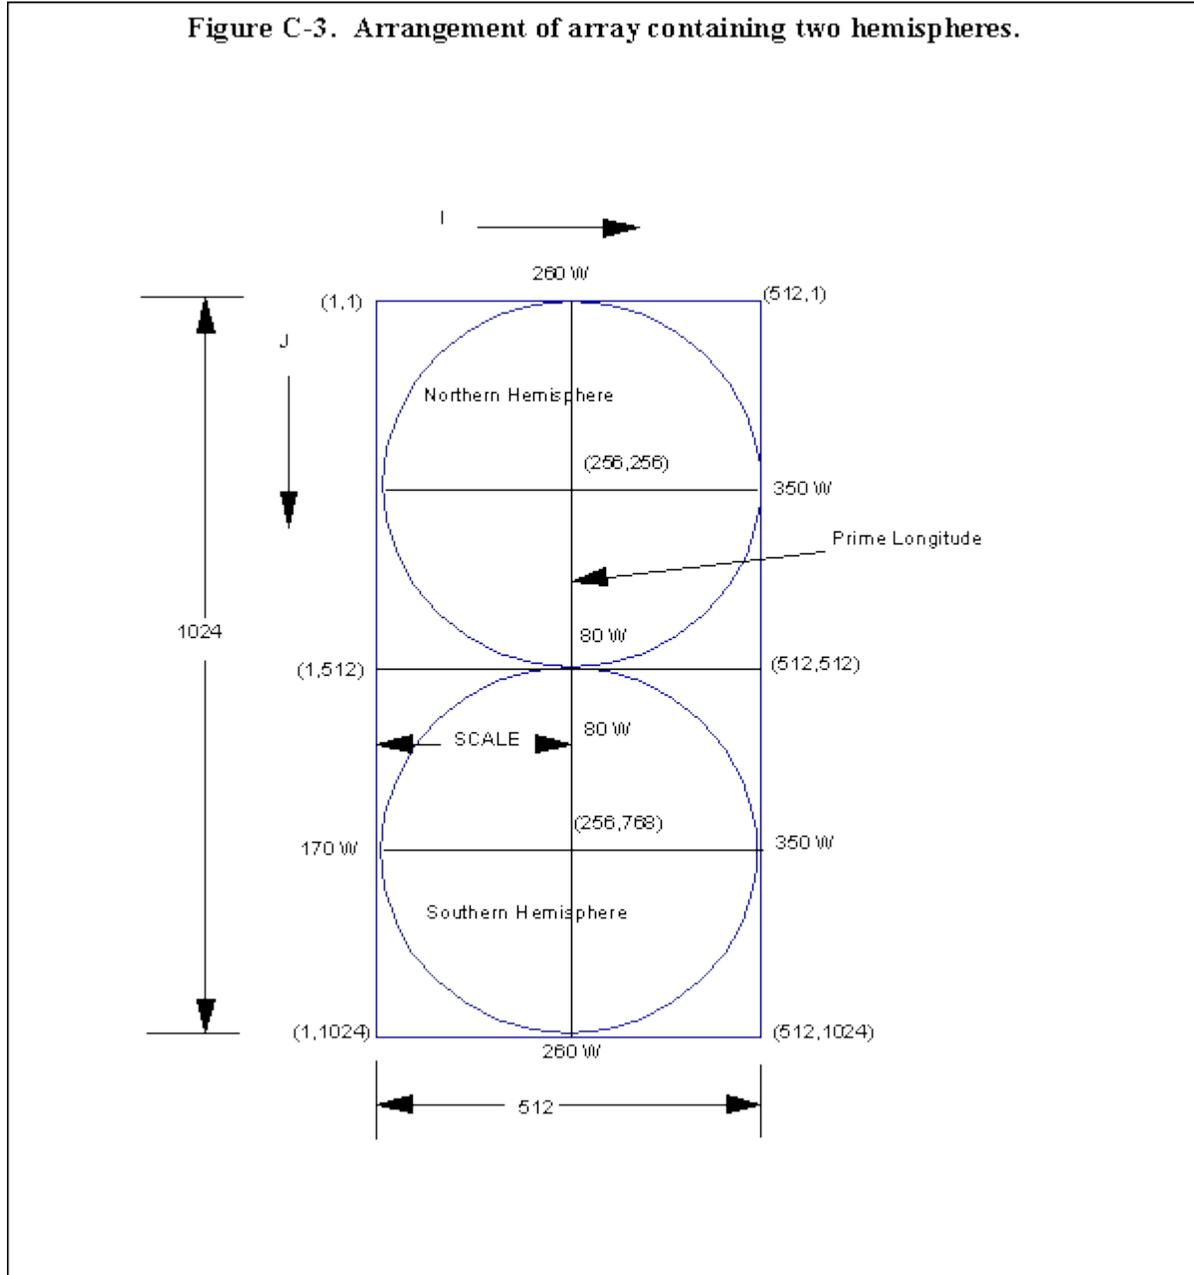

$$PNTLAT = \alpha = 90^{\circ} - 2\theta = 90^{\circ} - 2 \arctan\left(\frac{POLDIS}{SCALE}\right)$$

From Figure C-2, the longitude is defined as:

$$PNTLON = PRMLON - ANG2$$

Subroutines IJTOLL and LLTOIJ can be used for an array containing one or two hemispheres. For the case of two hemispheres, IJTOLL and LLTOIJ assume that they are arranged as shown in Figure C-3. For purposes of illustration only, the array shown is dimensioned as two 512 x

512s or one 512 x 1024.

**Figure C-3. Arrangement of array containing two hemispheres.**

There is one special case where these equations blow up, which happens when the point is at a pole. This makes  $POLDIS=0.0$  and is handled by setting the latitude to  $\pm 90$  degrees and the longitude to the prime longitude. There are a series of tests in IJTOLL which compensate for the longitude according to which quadrant the point resides. These tests produce the correct longitude for both the Northern and Southern Hemispheres.

If an  $i, j$  value is input which falls outside the Earth's disk but inside the array itself, the

algorithm checks whether POLDIS exceeds SCALE. If it does not, then it sets the latitude and longitude to -999.9.

The algorithms which LLTOIJ are based upon can easily be derived by working the IJTOLL equations backwards. LLTOIJ computes the distance of the projected point from the pole using the latitude angle and some simple trigonometry. In addition, LLTOIJ computes the angular difference between the prime longitude and the longitude of the point. These two parameters are then used to compute the i and j coordinates of the point.

In Figure C-3, the upper 512 x 512 array contains the Northern Hemisphere while the lower 512 x 512 array contains the Southern Hemisphere. Subroutine IJTOLL will automatically return the latitude and longitude (or LLTOIJ will return the i and j coordinates) for the Southern Hemisphere although the CENTI and CENTJ input parameters specifically refer to the Northern Hemisphere.

The arrangement shown in Figure C-3 is not mandatory in order for IJTOLL and LLTOIJ to function properly. For example, the data for the Northern Hemisphere could be contained in one 512 x 512 array and the data for the Southern Hemisphere could be contained in an entirely separate 512 x 512 array. For that case, IJTOLL and LLTOIJ could be used for the Northern Hemisphere with the proper input arguments. IJTOLL and LLTOIJ could also be used for the Southern Hemisphere using the same input arguments except the prime longitude which would have to be changed. (It is assumed that the orientation of the Hemispheres with the arrays is the same as in Figure C-3.)

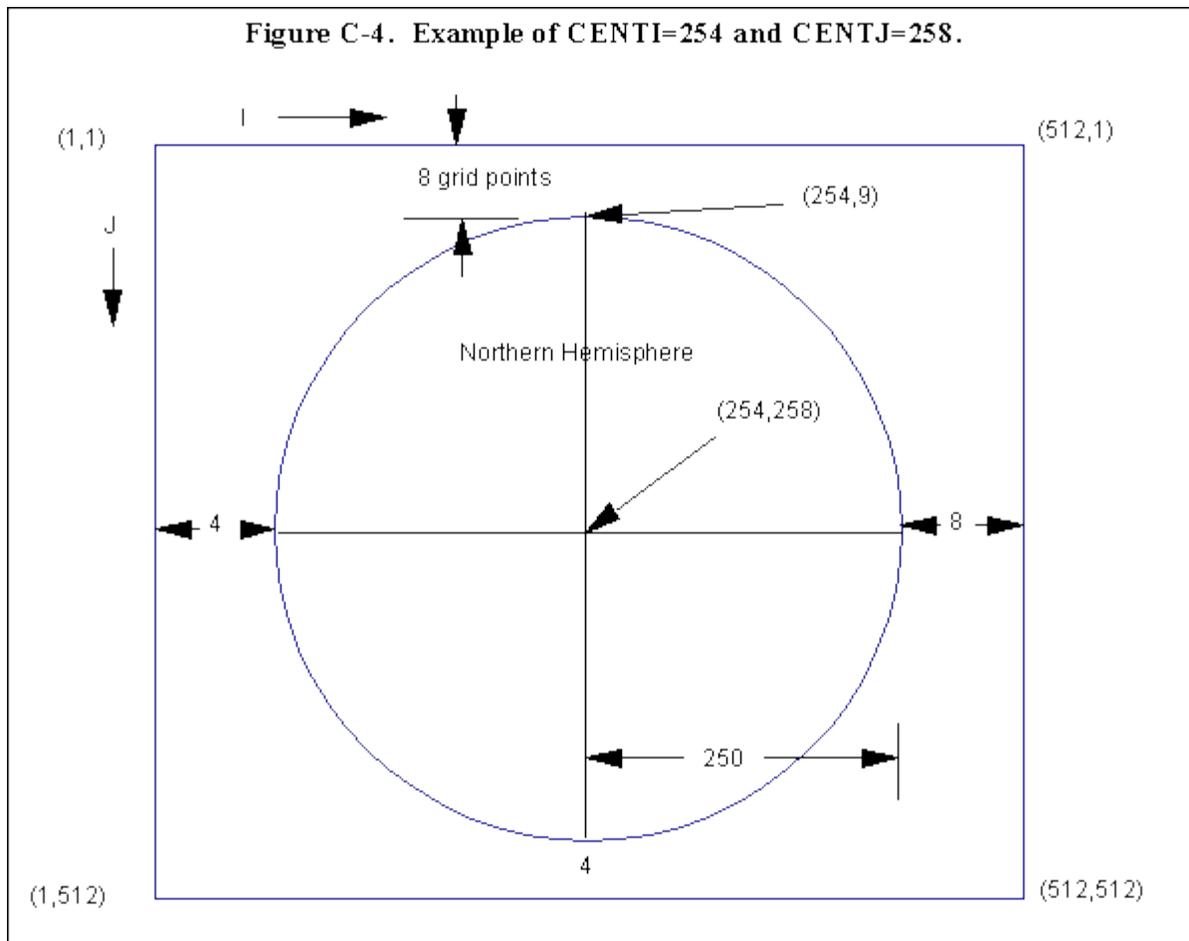

IJTOLL and LLTOIJ represent the i and j coordinates in such a way that the i values represent the columns and the j values represent the rows of the array. Some of the principal points of the Earth's disk have been labeled with their proper i and j coordinates in parentheses in Figure C-3.

For the example in Figure C-3, the input arguments would be set as follows:

PRMLON = +80.0  
SCALE = 256.0  
CENTI = 256.0  
CENTJ = 256.0

The input parameters can be adjusted so that IJTOLL and LLTOIJ can be applied to any case. For example, the array for the Northern Hemisphere is a 512 x 512 array. But unlike the case shown in Figure C-3, the Earth's disk is smaller than the boundary of the array. There are 8 blank-filled rows at the top and 4 at the bottom. Plus, there are 4 blank-filled columns on the left and 8 on the right of the Earth's disk. In this case, SCALE = 256.0.

CENTI = 250.0 + 4.0 = 254.0 and the CENTJ = 250.0 + 8.0 = 258.0. See Figure C-4 for an illustration of this example.

**Figure C-4. Example of CENTI=254 and CENTJ=258.**

In LLTOIJ, there is a problem with obtaining the proper i and j coordinates for any point along the equator in the Southern Hemisphere. This is caused by the fact that the computer represents -0.0 as 0.0; therefore, making it impossible to represent the Southern Hemisphere equator. To obtain the approximate i and j coordinates for the equator in the Southern Hemisphere, input a number between 0.0 and -1.0 for the latitude. Or alternately input the latitude as 0.0, and add the value of 2 x CENTJ to the RJ value obtained. (Adding 2 x CENTJ to RJ would give the RJ the correct value for the Southern Hemisphere.)

### C.3 PROGRAM LISTINGS

A listing of the FORTRAN code for subroutines IJTOLL and LLTOIJ follows.

```
      SUBROUTINE IJTOLL (PRMLON, SCALE, CENTI, CENTJ, RI, RJ, PNTLAT, PNTLON)
C THIS SUBROUTINE CONVERTS I AND J COORDINATES OF A POINT ON
C A POLAR STEREOGRAPHIC MAP TO LATITUDE AND LONGITUDE.
C
C INPUT
C PRMLON  PRIME LONGITUDE OF MAP BASE IN DEGREES. CAN BE
C         EITHER POSITIVE 0-360W OR POSITIVE 0-180W AND
C         NEGATIVE 0-180E.
C SCALE   DISTANCE FROM POLE TO EQUATOR IN GRID POINTS.
C CENTI,  CENTER OF THE ARRAY IN I AND J COORDINATES.
C CENTJ
C RI, RJ  THE I AND J COORDINATE OF THE POINT TO BE CONVERTED.
C OUTPUT
C PNTLAT  THE LATITUDE OF THE POINT IN DEGREES (POSITIVE
C         0-90N AND NEGATIVE 0-90S).
C PNTLON  THE LONGITUDE OF THE POINT IN DEGREES WITH SAME
C         SIGN CONVENTION AS PRMLON.
C         SOUTH=2.0*CENTJ
C         RY=RJ
C         RADDEG=0.01745329
C CHECK WHETHER POINT IS IN SOUTHERN HEMISPHERE AND ADJUST
C ACCORDINGLY.
C IF (RJ.GT.SOUTH) RJ=2.0*SOUTH-RJ
C COMPUTE THE DISTANCE BETWEEN THE POLE AND THE POINT. IF
C POLDIS IS GREATER THAN SCALE, SET PNTLAT AND PNTLON TO
C -999.9 TO INDICATE AREA OUTSIDE OF EARTH'S DISK. IF POLDIS
C EQUALS SCALE SET PNTLAT AND PNTLON EQUAL TO A POLE.
C POLDIS=SQRT(ABS(CENTI-RI)**2.0+ABS(CENTJ-RJ)**2.0)
C IF (POLDIS.GT.SCALE) GO TO 50
C IF (POLDIS.EQ.0) GO TO 30
C COMPUTE PNTLAT AND PNTLON FROM ANG1 AND ANG2, THEN ADJUST
C PNTLAT ACCORDING TO RELATION WITH CENTER OF ARRAY.
C ANG1=ATAN(POLDIS/SCALE)
C ANG2=ACOS((CENTJ-RJ)/POLDIS)
C IF (RJ.GT.CENTJ) ANG2=ACOS((RJ-CENTJ)/POLDIS)
C PNTLON=PRMLON-ANG2/RADDEG
C IF (RI.GT.CENTI.AND.RJ.LE.CENTJ) PNTLON=PRMLON+ANG2/RADDEG
C IF (RI.LT.CENTI.AND.RJ.GE.CENTJ) PNTLON=PRMLON+ANG2/RADDEG
C PNTLAT=90.0-2.0*ANG1/RADDEG
C IF (RI.LE.CENTI.AND.RJ.LT.CENTJ) PNTLON=PNTLON+180.0
C IF (RI.GT.CENTI.AND.RJ.LE.CENTJ) PNTLON=PNTLON+180.0
C IF (RY.GT.SOUTH) PNTLAT=-PNTLAT
```

```
RJ=RY
RETURN
30 PNTLAT=90.0
  PNTLON=PRMLON
  IF (RY.GT.SOUTH) PNTLAT=-PNTLAT
  RJ=RY
  RETURN
50 PNTLAT=-999.9
  PNTLON=-999.9
  RJ=RY
  RETURN
END
```

```

SUBROUTINE LLTOIJ (PRMLON, SCALE, PNTLAT, PNTLON, CENTI, CENTJ, RI, RJ)
C THIS SUBROUTINE CONVERTS LATITUDE AND LONGITUDE OF A POINT
C ON A POLAR STEREOGRAPHIC MAP TO I AND J COORDINATES.
C
C INPUT
C PRMLON PRIME LONGITUDE OF MAP BASE IN DEGREES. CAN BE
C EITHER POSITIVE 0-360W OR POSITIVE 0-180W AND
C NEGATIVE 0-180E.
C SCALE DISTANCE FROM POLE TO EQUATOR IN GRID POINTS.
C CENTI, CENTER OF THE ARRAY IN I AND J COORDINATES.
C CENTJ
C PNTLAT THE LATITUDE OF THE POINT TO BE CONVERTED
C IN DEGREES (POSITIVE 0-90N AND NEGATIVE 0-90S).
C PNTLON THE LONGITUDE OF THE POINT TO BE CONVERTED
C IN DEGREES WITH SAME SIGN CONVENTION AS PRMLON.
C
C OUTPUT
C RI THE I COORDINATE OF THE POINT.
C RJ THE J COORDINATE OF THE POINT.
C
SOUTH=2.0*CENTJ
RADDEG=0.01745329
C COMPUTE THE DISTANCE OF THE PROJECTED POINT FROM THE
C POLE.
ANG1=(90.0-ABS(PNTLAT))*RADDEG/2.0
POLDIS=SCALE*TAN(ANG1)
C COMPUTE THE DIFFERENCE IN RADIANS BETWEEN THE PRIME
C LONGITUDE AND THE LONGITUDE OF THE POINT.
ANG2=(PRMLON-PNTLON)*RADDEG
C COMPUTE THE I AND J COORDINATES OF THE POINT (RI AND RJ).
RI=CENTI+POLDIS*SIN(ANG2)
IF(PRMLON.LT.0.0) RI=CENTI-POLDIS*SIN(ANG2)
IF(PNTLAT.LT.0.0) GO TO 10
RJ=CENTJ+POLDIS*COS(ANG2)
RETURN
10 RJ=CENTJ-POLDIS*COS(ANG2)
IF(PNTLAT.LT.0.0) RJ=RJ+SOUTH
RETURN
END

```

## APPENDIX D: MISCELLANEOUS PARAMETERS FOR THE POLAR ORBITER SATELLITES

This section provides more detailed information for the NOAA KLMNN' series and Metop series, including tables for HIRS/3, AMSU-A and -B channel spectral response and HIRS/3 thermal band-correction coefficients, tables for AVHRR/3 infrared channel central wave numbers as a function of temperature, and the spectral response curves and actual values for the AVHRR/3 instrument. Many of these parameters are needed for calibration purposes.

Up to date information regarding abnormalities on the POES spacecraft and instruments can be found at: <http://www.oso.noaa.gov/poesstatus/>. This website allows a user to search and sort on any POES spacecraft, subsystem or instrument status. Additional details about the various satellites can be obtained by going to the NOAA/NESDIS/Office of Satellite Operations' (OSO) archive of weekly status reports at: <http://noaasis.noaa.gov/NOAASIS/ml/podocs.html>.

The spectral response functions for the POES instruments can be obtained from Global Space-based Inter-Calibration System Coordination Center hosted by NOAA at <http://www.star.nesdis.noaa.gov/smcd/GCC/instrInfo-srf.php>.

Tables D.1 and D.2 show the launch dates, decommission dates, instrument number and instrument status as of August 8, 2014.

In addition, this appendix contains information that was formerly reported in *NOAA Technical Memorandum 107, Appendix B* (Planet, 1988). This information includes coefficients necessary for calibration purposes which are primarily used by High Resolution Picture Transmission (HRPT) and Direct Sounder Broadcast (DSB) service users. Some of the coefficients may also be useful to Automatic Picture Transmission (APT) data users.

## D.1 NOAA-15 (K)

Launch date: May 13, 1998

Operational dates: December 15, 1998 to present

Morning orbit: 1930 LST ascending node, 0730 LST descending node

AVHRR instrument: 6 channels (AVHRR/3)

Spacecraft ID: 4

Abnormalities: During NOAA-15 activation and evaluation, it was determined that AMSU-A channels 7 and 15 were switched. This switch should be transparent to Level 1b users as the channels were corrected (switched back) by the ingest software, however, direct readout users should be aware of this problem. Only the radiometric data was affected, the housekeeping temperatures, antenna patterns, beam efficiency and beam widths of channels 15 and 7 oscillators are correct as they are now and were not affected by the switch. Band pass for channels 7 and 15 was also not affected due to extremely broad rf-detectors.

The NOAA-15 AMSU-B instrument is experiencing RFI contamination whose effect is dependent upon channel, geographic location, and current spacecraft antenna configuration. Calculations for generation of corrections for this contamination is an on- going effort. For the latest corrections needed for processing of this data see Appendix M.

On 10 July 2000, there was an apparent failure of the NOAA-15 AVHRR scan motor. HRPT and APT image data was missing through July 12, orbit 11250. On this orbit, AVHRR synchronization was restarted and HRPT and APT image data temporarily resumed. AVHRR synchronization was again lost 22 July on orbit 11395. Tests during December 2000 and January 2001 have shown that lowering the temperature of the instrument has restored a degree of stability. Beginning 20 March 2001, NOAA began to resynchronize the AVHRR once daily at 0730 UTC. The AVHRR has shown the ability to retain synchronization for longer periods with this daily reset. During the time of the resynchronization, there is a very brief disruption on all data in the HRPT transmission. When the AVHRR is in synchronization, usable images may be obtained. When the AVHRR synchronization is out of limits, images are unusable. HRPT transmitter will remain ON; the APT transmitter turned ON at 1611 UTC, 15 March 2001. At 1820 UTC, on 30 October 2000, the NOAA-15 AMSU-A Channel 14 failed and is no longer usable.

Table D.1-1 contains the measured channel characteristics for NOAA-15 AMSU-A (channels 1-15) and AMSU-B (channels 16-20). Detailed information on the terminology used in this table can be found in Section 3.3.2.1.

The slope and intercept for the NOAA-15 HIRS/3 visible channel (Channel 20) are given in Table D.1-3.

<b>Table D.1-3. NOAA-15 HIRS/3 Channel 20 Slope and Intercept (Albedo %).</b>		
Source	Slope	Intercept
Pre-launch calibration	0.02336	36.0500
Post-launch calibration (May 2002)	0.03174	47.1100
<b>Notes:</b>		
1. To retrieve the albedo, use the following equation: $\text{albedo} = (\text{intercept} + \text{slope} \times C) / \cos(z)$ where C=earth view count, z=solar zenith angle. Both C and z vary from pixel to pixel.		
2. Post-launch calibration is traceable to the Libyan desert calibration site, for which the HIRS channel 20 albedo is ~36.1%. Further update to these coefficients may be needed as the instrument degrades over time.		

Table D.1-4 contains the NOAA-15 HIRS/3 central wave numbers and band correction coefficients for the thermal channels.

<b>Table D.1-4. NOAA-15 HIRS/3 Central Wave Numbers and Band Correction Coefficients.</b>

Table D.1-6 contains the pre-launch calibration coefficients (albedo representation) for the AVHRR/3 instrument on NOAA-15.

<b>Table D.1-6. NOAA-15 AVHRR/3 Pre-launch Calibration Coefficients (Albedo Representation).</b>			
<b>Channel #</b>	<b>Contents</b>	<b>Slope</b>	<b>Intercept</b>
1	Low albedo range (0-25%)	0.0568	-2.1874
	High albedo range (26 - 100%)	0.1633	-54.9928
2	Low albedo range (0-25%)	0.0596	-2.4096
	High albedo range (26 - 100%)	0.1629	-55.2436
3A	Low albedo range (0-12.5%)	0.0275	-1.0684
	High albedo range (12.6 - 100%)	0.1846	-78.1691

**Note:**  
The albedo ranges given in parentheses are nominal; the points of intersection of the two regression lines are located at 496, 511, and 491 counts (rounded off to the nearest integer) for Channels 1,2, and 3A, respectively. This information is based on the data in Instruction Manual and Alignment/Calibration Handbook and Optical Data, submitted to NASA/GSFC by ITT Aerospace/Communications (Report 8172836, Rev A), October 1997.

Table D.1-7 contains NOAA-15 AVHRR/3 visible channel information such as equivalent width,  $w$ , effective central wavelength,  $\lambda_e$ , and in-band solar irradiance,  $F$ .

<b>Table D.1-7. NOAA-15 AVHRR/3 Visible Channel Information.</b>			
<b>Channel</b>	$w$ ( $\mu\text{m}$ )	$\lambda_e$ ( $\mu\text{m}$ )	$F$ ( $\text{W}/\text{m}^2$ )
1	0.084	0.632	138.7
2	0.228	0.843	235.4
3A	0.044	1.607	10.6

**Note:**  
These quantities are based on the solar irradiance data of Neckel and Labs (1984), which is a widely used source of such data.

Table D.1-8 contains NOAA-15 coefficients  $d_0$ ,  $d_1$ ,  $d_2$ ,  $d_3$ , and  $d_4$  that relate temperature,  $T_{\text{PRT}}$  (Kelvin), of each PRT to count value,  $C_{\text{PRT}}$ , by the equation:

$$T_{\text{PRT}} = d_0 + d_1 C_{\text{PRT}} + d_2 C_{\text{PRT}}^2 + d_3 C_{\text{PRT}}^3 + d_4 C_{\text{PRT}}^4$$

<b>Table D.1-8. NOAA-15 AVHRR/3 Conversion Coefficients</b>					
<b>PRT</b>	<b>d<sub>0</sub></b>	<b>d<sub>1</sub></b>	<b>d<sub>2</sub></b>	<b>d<sub>3</sub></b>	<b>d<sub>4</sub></b>
1	276.60157	0.051045	1.36328E-06	0	0

## **D.2 NOAA-16 (L)**

Launch date: September 21, 2000

Operational dates: March 20, 2001 - present

Afternoon orbit: 1400 LST ascending node, 0200 LST descending node

AVHRR instrument: 6 channels (AVHRR/3)

Spacecraft ID: 2

Abnormalities:

Up to date information regarding abnormalities on the POES spacecraft and instruments can be found at: <http://www.oso.noaa.gov/poesstatus/>. This website allows a user to search and sort on any POES spacecraft, subsystem or instrument status. Once a user narrows down their window of interest, further details can be obtained by going to the NOAA/NESDIS/Office of Satellite Operations' (OSO) archive of weekly status reports at: <http://noaasis.noaa.gov/NOAASIS/ml/podocs.html>

Table D.2-1 contains the measured channel characteristics for NOAA-16 AMSU-A (channels 1-15) and AMSU-B (channels 16-20). Detailed information on the terminology used in this table can be found in Section 3.3.2.1.

<b>Table D.2-1. Measured Channel Characteristics for NOAA-16 AMSU-A and AMSU-B.</b>

\* The lower frequency cutoff in these single passband channels is due to the stop band.

Table D.2-2 contains the Internal Warm Temperature (IWT) PRT count to temperature coefficients for the NOAA-16 HIRS/301 instrument.

<b>Table D.2-2. NOAA-16 IWT PRT Count to Temperature Coefficients for HIRS/301.</b>					
<b>PRT</b>	<b>a<sub>0</sub></b>	<b>a<sub>1</sub></b>	<b>a<sub>2</sub></b>	<b>a<sub>3</sub></b>	<b>a<sub>4</sub></b>
1	301.45076	6.530210E-03	8.326151E-08	4.724724E-11	1.565263E-15
2	301.39565	6.527550E-03	8.417738E-08	4.727738E-11	1.460746E-15
3	301.40733	6.528222E-03	8.314237E-08	4.721744E-11	1.543985E-15
4	301.40280	6.525508E-03	8.269671E-08	4.707211E-11	1.549894E-15

The slope and intercept for the NOAA-16 HIRS/301 visible channel (Channel 20) are given in Table D.2-3.

<b>Table D.2-3. NOAA-16 HIRS/301 Channel 20 Slope and Intercept (Albedo %).</b>		
<b>Source</b>	<b>Slope</b>	<b>Intercept</b>
Pre-launch calibration	0.021354	51.4852
Post-launch calibration (May 2002)	0.02611	62.3307

**Notes:**

- To retrieve the albedo, use the following equation:  

$$\text{albedo} = (\text{intercept} + \text{slope} \times C) / \cos(z)$$
 where C=earth view count and z=solar zenith angle. Both C and z vary from pixel to pixel.
- Post launch calibration is traceable to the Libyan desert calibration site, for which the HIRS channel 20 albedo is ~36.1%. Further update to these coefficients may be needed as the instrument degrades over time.

Table D.2-4 contains the NOAA-16 HIRS/301 central wave numbers and band correction coefficients for the thermal channels.

<b>Table D.2-4. NOAA-16 HIRS/301 Central Wave Numbers and Band Correction Coefficients.</b>

In April 2002, the post-launch calibration for the reflectance (visible) channels of the NOAA-16 AVHRR was reviewed, based on measurements taken over the radiometrically stable targets of the Libyan and Takla Makan Deserts. It was found that there was little loss of sensitivity immediately following the launch of NOAA-16, even though this has been typical behavior for the AVHRR reflectance channels in the past. There was also little degradation in the NOAA-16 AVHRR reflectance channels and the pre-flight coefficients were in reasonable agreement with the ground based truth. Measurements were also made by MODerate-resolution Imaging Spectro-radiometer (MODIS) which is flown on NASA's Earth Observing Satellites (EOS). The MODIS-based coefficients result in reflectances that are somewhat higher than the truth (Heidinger et al. 2002: Using MODIS to calibrate AVHRR reflectance channels, *J. Geophys. Res. - Atmosphere* in press).

Based on these findings, NOAA is recommending (as of Nov. 6, 2002) that the pre-flight calibration coefficients for NOAA-16 AVHRR Channels 1 and 2 be used. However, because there is no desert-based absolute calibration for Channel 3A, NOAA recommends using the MODIS-based calibration for this channel. Table D.2 -7 contains the pre-launch and MODIS-based calibration coefficients for the AVHRR/3 instrument on NOAA-16. The columns labeled "Reflectance" are the reflectances for the Libyan Desert derived with corresponding coefficients, and the shaded areas indicate the NOAA recommended values.

<b>Table D.2-7. NOAA-16 AVHRR/3 Pre-launch Calibration Coefficients (Albedo Representation).</b>								
		<b>Pre-flight AVHRR</b>			<b>MODIS-based</b>			<b>Truth</b>
Channel		Slope	Intercept	Reflectance	Slope	Intercept	Reflectance	Reflectance
1	Low	0.0523	-2.016	38.3	0.0539	-2.12	39.2	37.8
	High	0.1528	-51.91		0.1656	-58.4		
2	Low	0.0513	-1.943	40.5	0.0603	-2.35	46.0	42.6
	High	0.1510	-51.77		0.1580	-51.3		
3A	Low	0.0287	-2.043	66.7	0.0262	-1.01	64.5	n/a

High	0.1806	-78.03	0.1920	-84.2	
------	--------	--------	--------	-------	--

In summary, NOAA recommends using the following equations for NOAA-16 AVHRR reflectance channels:

Channel 1:

$$A_1 = \begin{cases} 0.0523 \times count - 2.016, & count < 497.5 \\ 0.1528 \times count - 51.91, & count > 497.5 \end{cases}$$

Channel 2:

$$A_2 = \begin{cases} 0.0513 \times count - 1.943, & count \leq 499 \\ 0.1510 \times count - 51.77, & count \geq 500 \end{cases}$$

Channel 3A:

$$A_{3A} = \begin{cases} 0.0262 \times count - 1.010, & count < 498.7 \\ 0.1920 \times count - 84.20, & count > 498.7 \end{cases}$$

where count represents the 10-bit digital count as recorded by the AVHRR instrument and A is the albedo assuming the Sun is at its zenith and the Sun-Earth distance is one astronomical unit (A is also referred to as the reflectance factor or adjusted reflectance).

Table D.2-8 contains NOAA-16 AVHRR/3 visible channel information such as equivalent width, w, effective central wavelength,  $\lambda_e$ , and in-band solar irradiance, F.

<b>Table D.2-8. NOAA-16 AVHRR/3 Visible Channel Information.</b>			
<b>Channel</b>	<b>Equivalent Width <math>w</math> (<math>\mu\text{m}</math>)</b>	<b>Effective Wavelength <math>\lambda_e</math> (<math>\mu\text{m}</math>)</b>	<b>Extraterrestrial Solar Irradiance in Band F (W/m<sup>2</sup>)</b>
1	0.081	0.632	133.2
2	0.235	0.843	243.1
3A	0.045	1.605	10.96

Note: These quantities are based on the solar irradiance data of Neckel and Labs (1984), which is a widely used source of such data.

Table D.2-9 contains NOAA-16 coefficients d0, c1, d2, d3 and d4 that relate temperature, TPRT, (degrees Kelvin) of each PRT to count value, CPRT, by the equation:

<b>Table D.2-9. NOAA-16 AVHRR/3 Conversion Coefficients.</b>					
<b>PRT</b>	<b>d<sub>0</sub></b>	<b>d<sub>1</sub></b>	<b>d<sub>2</sub></b>	<b>d<sub>3</sub></b>	<b>d<sub>4</sub></b>
1	276.355	5.562E-02	-1.590E-05	2.486E-08	-1.199E-11
2	276.142	5.605E-02	-1.707E-05	2.595E-08	-1.224E-11

Table D.2-12 contains the radiance-to-temperature coefficients for NOAA-16 AVHRR/3 Channels 3B, 4 and 5.

<b>Table D.2-12. NOAA-16 AVHRR/3 Thermal Channel Radiance-to-Temperature Coefficients.</b>			
	$\nu_c$	<b>A</b>	<b>B</b>
Channel 3B	2700.1148	1.592459	0.998147
Channel 4	917.2289	0.332380	0.998522
Channel 5	838.1255	0.674623	0.998363

Figures D.2-1 through D.2-6 contains the spectral response curves for NOAA-16 AVHRR/3 Channels 1, 2, 3A, 3B, 4 and 5, respectively.

Figure D.2-1. Spectral Response Curve for NOAA-16 AVHRR/3 Channel 1.

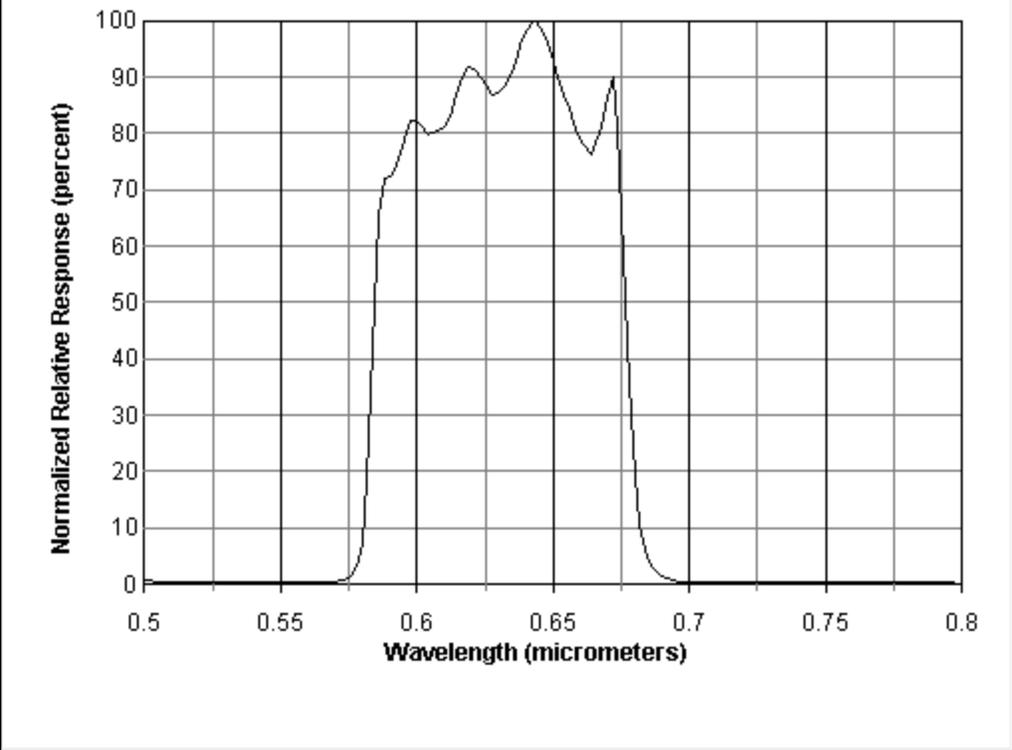

Figure D.2-1. Spectral Response Curve for NOAA-16 Channel 1.

Figure D.2-2. Spectral Response Curve for NOAA-16 AVHRR/3 Channel 2.

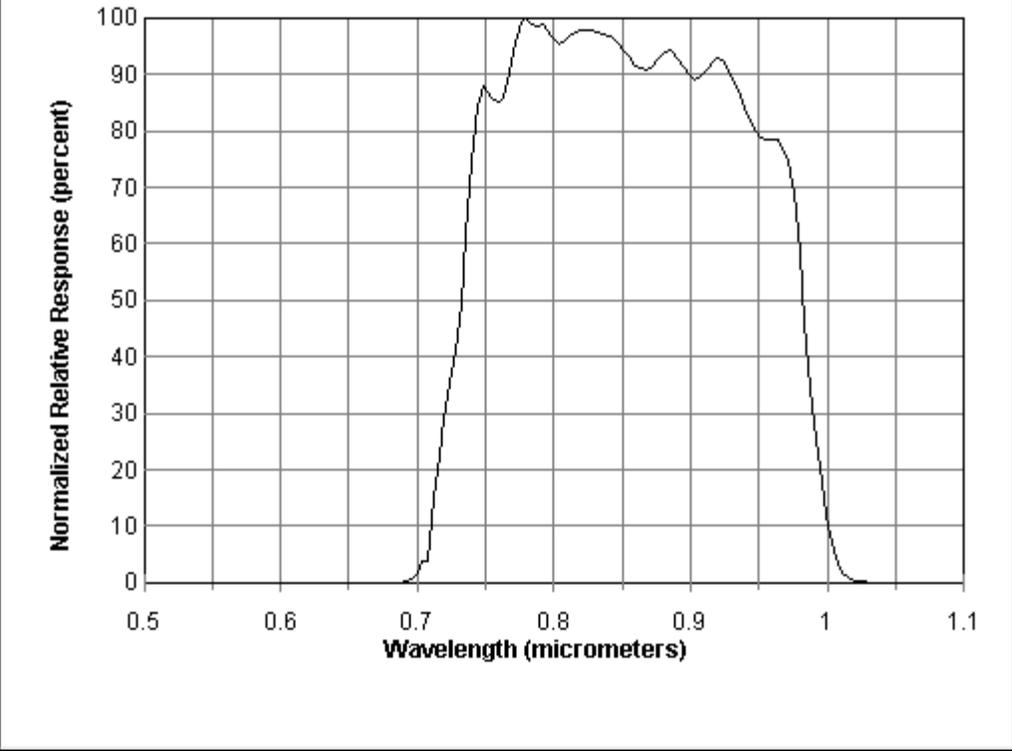

Figure D.2-1. Spectral Response Curve for NOAA-16 Channel 2.

Figure D.2-3. Spectral Response Curve for NOAA-16 AVHRR/3 Channel 3A.

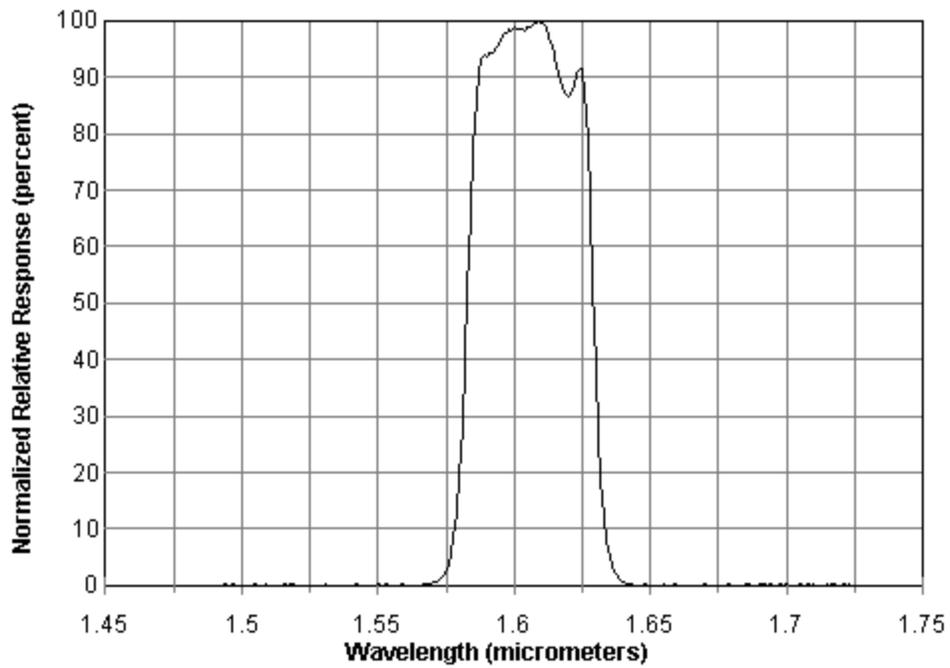

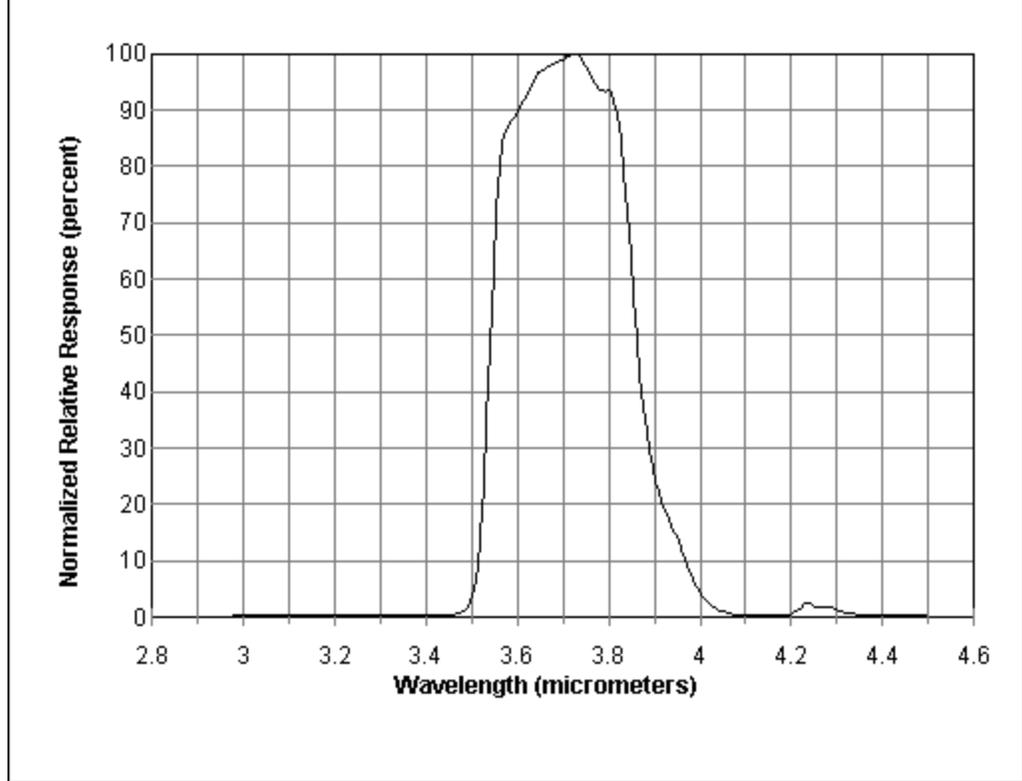

Figure D.2-3. Spectral Response Curve for NOAA-16 Channel 3A.

**Figure D.2-4. Spectral Response Curve for NOAA-16 AVHRR/3 Channel 3B.**

**Figure D.2-4. Spectral Response Curve for NOAA-16 Channel 3B.**

Figure D.2-5. Spectral Response Curve for NOAA-16 AVHRR/3 Channel 4.

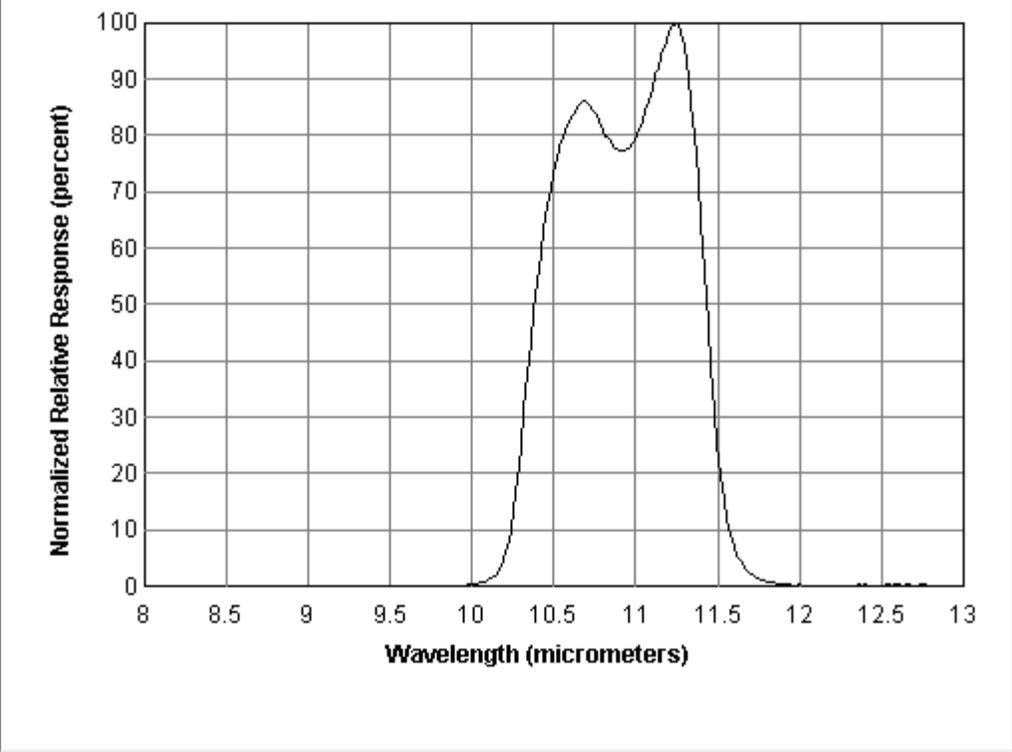

Figure D.2-5. Spectral Response Curve for NOAA-16 Channel 4.

Figure D.2-6. Spectral Response Curve for NOAA-16 AVHRR/3 Channel 5.

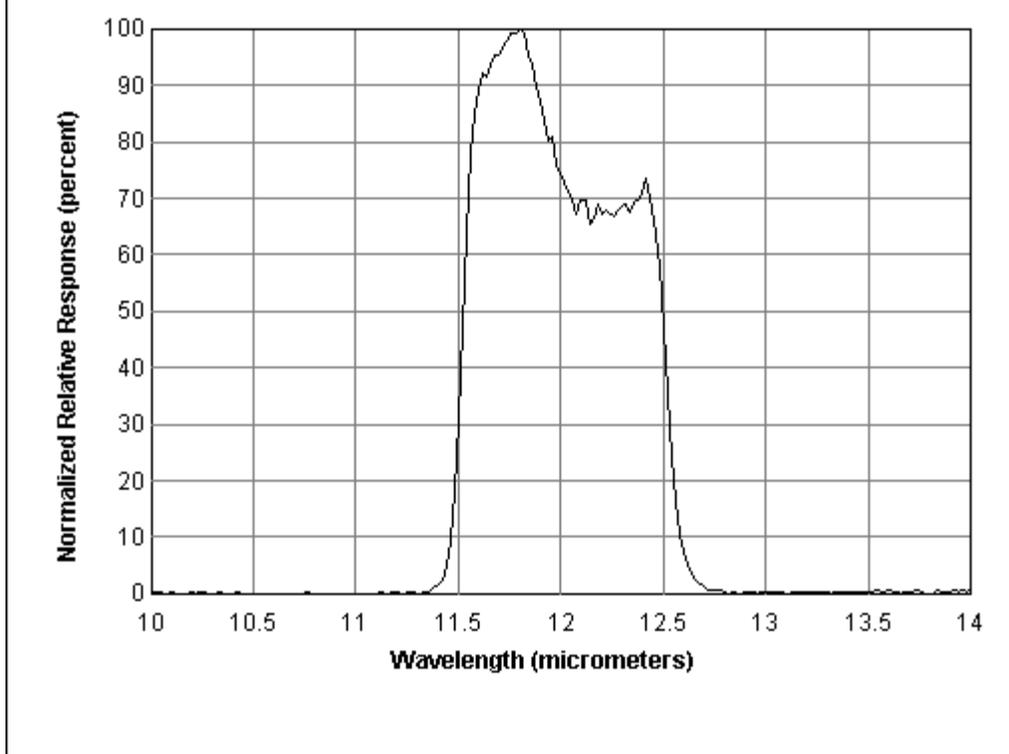

Figure D.2-6. Spectral Response Curve for NOAA-16 Channel 5.

Tables D.2-13 and D.2-14 contain the corresponding spectral response values for NOAA-16 AVHRR/3 Channels 1, 2, 3A and Channels 3B, 4 and 5, respectively. Note: Negative response values were caused by system response noise and are to be ignored but are included in the table for completeness.

### **D.3 NOAA-17 (M)**

Launch date: June 24, 2002

Operational dates: October 15, 2002 - present

Morning orbit: 2200 LST ascending node, 1000 LST descending node

AVHRR instrument: 6 channels (AVHRR/3)

Spacecraft ID: 6

Abnormalities:

Up to date information regarding abnormalities on the POES spacecraft and instruments can be found at: <http://www.oso.noaa.gov/poesstatus/>. This website allows a user to search and sort on any POES spacecraft, subsystem or instrument status. Once a user narrows down their window of interest, further details can be obtained by going to the NOAA/NESDIS/Office of Satellite Operations' (OSO) archive of weekly status reports at: <http://noaasis.noaa.gov/NOAASIS/ml/podocs.html>.

**AVHRR:**

Table D.3-1 contains the PRT weighting factors for NOAA-17.

<b>Table D.3-1. NOAA-17 PRT Weighting Factors</b>			
<b>b<sub>1</sub></b>	<b>b<sub>2</sub></b>	<b>b<sub>3</sub></b>	<b>b<sub>4</sub></b>
.25	.25	.25	.25

<b>Table D.3-2. NOAA-17 Radiance of Space and Coefficients for Nonlinear Radiance Correction Quadratic.</b>				
	<b>N<sub>S</sub></b>	<b>b<sub>0</sub></b>	<b>b<sub>1</sub></b>	<b>b<sub>2</sub></b>
Channel 4	-8.55	8.22	-0.15795	0.00075579
Channel 5	-3.97	4.31	-0.07318	0.00030976

Table D.3-3 contains NOAA-17 coefficients d<sub>0</sub>, d<sub>1</sub>, d<sub>2</sub>, d<sub>3</sub> and d<sub>4</sub> that relate temperature, T<sub>PRT</sub> (Kelvin) of each PRT to count value, C<sub>PRT</sub>, by the equation:

$$T_{PRT} = d_0 + d_1 C_{PRT} + d_2 C_{PRT}^2 + d_3 C_{PRT}^3 + d_4 C_{PRT}^4$$

<b>PRT</b>	<b>d<sub>0</sub></b>	<b>d<sub>1</sub></b>	<b>d<sub>2</sub></b>	<b>d<sub>3</sub></b>	<b>d<sub>4</sub></b>
1	276.628	0.05098	1.371 E-06	0	0
2	276.538	0.05098	1.371 E-06	0	0
3	276.761	0.05097	1.369 E-06	0	0
4	276.660	0.05100	1.348 E-06	0	0

Table D.3-4 contains the pre-launch calibration coefficients (albedo representation) for the AVHRR/3 instrument on NOAA-17.

<b>Channel #</b>	<b>Contents</b>	<b>Slope</b>	<b>Intercept</b>
1	Low albedo range (0-25%)	0.0555	-2.2193
	High albedo range (26 - 100%)	0.1627	-55.9635
2	Low albedo range (0-25%)	0.0543	-2.1227
	High albedo range (26 - 100%)	0.1621	-56.2160
3A	Low albedo range (0-12.5%)	0.0265	-1.1153
	High albedo range (12.6 - 100%)	0.1860	-81.2520

**Note:** The albedo ranges given in parentheses are nominal; the points of intersection of the two regression lines are located at 497.53, 500.32, and 498.66 counts for channels 1,2, and 3A respectively. This information is based on the data in Instruction Manual and Alignment/Calibration Handbook and Optical Data, submitted to NASA/GSFC by ITT Aerospace/Communications (Report 8172845, Rev B), January 2002.

Table D.3-5 contains a summary of the spectral response data as a function of wavenumber for all channels of the NOAA-17 AVHRR/3.

Table D.3-6 contains NOAA-17 AVHRR/3 visible channel information such as equivalent width,  $w$ , effective central wavelength,  $b_e$ , and in-band solar irradiance,  $F$ .

<b>Table D.3-6. NOAA-17 AVHRR/3 Visible Channel Information.</b>			
<b>Channel</b>	<b>Equivalent Width <math>w</math> (<math>\mu\text{m}</math>)</b>	<b>Effective Wavelength <math>\lambda_e</math> (<math>\mu\text{m}</math>)</b>	<b>Extraterrestrial Solar Irradiance in Band <math>F</math> (<math>\text{W}/\text{m}^2</math>)</b>
1	0.0830	0.6343	136.212
2	0.2332	0.8431	240.558
3A	0.0514	1.6062	12.449

Note: These quantities are based on the solar irradiance data of Neckel and Labs (1984), which is a widely used source of such data.

Table D.3-7 contains the temperature-to-radiance coefficients for NOAA-17 AVHRR/3 Channels 3B, 4 and 5.

<b>Table D.3-7. NOAA-17 AVHRR/3 Thermal Channel Temperature-to-Radiance Coefficients.</b>			
	$\nu_c$	<b>A</b>	<b>B</b>
Channel 3B	2669.3554	1.702380	0.997378
Channel 4	926.2947	0.271683	0.998794
Channel 5	839.8246	0.309180	0.999012

Tables D.3-8 and D.3-9 contain the corresponding spectral response values for NOAA-17 AVHRR/3 Channels 1, 2, 3A and Channels 3B, 4 and 5, respectively. Note: Negative response values were caused by system response noise and are to be ignored but are included in the table for completeness.

**Table D.3-8. NOAA-17 AVHRR/3 Spectral Response Values for Channels 1, 2 and 3A.**

\* The lower frequency cutoff in these single passband channels is due to the stop band.

#### D.4 NOAA-18 (N)

Launch date: May 20, 2005

Operational dates: August 30, 2005 - present

Afternoon orbit: 1400 LST ascending node, 0200 LST descending node

AVHRR instrument: 6 channels (AVHRR/3)

Spacecraft ID (PACS): 7

- AVHRR: 13
- TIP 1 (TIP side 1): 13
- TIP 2 (TIP side 2): 14

Abnormalities:

Up to date information regarding abnormalities on the POES spacecraft and instruments can be found at: <http://www.oso.noaa.gov/poesstatus/>. This website allows a user to search and sort on any POES spacecraft, subsystem or instrument status. Once a user narrows down their window of interest, further details can be obtained by going to the NOAA/NESDIS/Office of Satellite Operations' (OSO) archive of weekly status reports at: <http://noaasis.noaa.gov/NOAASIS/ml/podocs.html>.

**AVHRR:**

Table D.4-1 contains the PRT weighting factors for NOAA-18 and Table D.4-2 contains the radiance of space and the coefficients for nonlinear radiance correction quadratic for NOAA-18.

<b>Table D.4-1. NOAA-18 PRT Weighting Factors.</b>

0.25	0.25	0.25	0.25

<b>Table D.4-2. NOAA-18 Radiance of Space and Coefficients for Nonlinear Radiance Correction Quadratic.</b>				
	<b>N<sub>S</sub></b>	<b>b<sub>0</sub></b>	<b>b<sub>1</sub></b>	<b>b<sub>2</sub></b>
Channel 4	-5.53	5.82	-0.11069	0.00052337
Channel 5	-2.22	2.67	-0.04360	0.00017715

Table D.4-3 contains NOAA-18 coefficients d<sub>0</sub>, d<sub>1</sub>, d<sub>2</sub>, d<sub>3</sub> and d<sub>4</sub> that relate temperature, T<sub>PRT</sub> (Kelvin) of each PRT to count value, C<sub>PRT</sub>, by the equation:

$$T_{PRT} = d_0 + d_1 C_{PRT} + d_2 C_{PRT}^2 + d_3 C_{PRT}^3 + d_4 C_{PRT}^4$$

<b>Table D.4-3. NOAA-18 AVHRR/3 Conversion Coefficients.</b>					
<b>PRT</b>	<b>d<sub>0</sub></b>	<b>d<sub>1</sub></b>	<b>d<sub>2</sub></b>	<b>d<sub>3</sub></b>	<b>d<sub>4</sub></b>
1	276.601	0.05090	1.657 E-06	0	0

2	276.683	0.05101	1.482 E-06	0	0
3	276.565	0.05117	1.313 E-06	0	0
4	276.615	0.05103	1.484 E-06	0	0

Table D.4-4 contains the pre-launch calibration coefficients (albedo representation) for the AVHRR/3 instrument on NOAA-18.

<b>Table D.4-4. NOAA-18 AVHRR/3 Pre-launch Calibration Coefficients (Albedo Representation).</b>			
<b>Channel #</b>	<b>Contents</b>	<b>Slope</b>	<b>Intercept</b>
1	Low albedo range (0-25%)	0.05400	-2.130
	High albedo range (26 - 100%)	0.16100	-55.37
2	Low albedo range (0-25%)	0.05290	-2.084
	High albedo range (26 - 100%)	0.15873	-55.31
3A	Low albedo range (0-12.5%)	0.02618	-0.982
	High albedo range (12.6 - 100%)	0.18492	-80.88

**Note:** The albedo ranges given in parentheses are nominal; the points of intersection of the two regression lines are located at 500.54, 500.40 and 500.56 counts for channels 1, 2, and 3A respectively. This information is based on the data in AVHRR S/N A306 Alignment/Calibration Handbook (Report 8172845, Rev B), January 2002.

Table D.4-5 contains a summary of the spectral response data as a function of wavenumber for all channels of the NOAA-18 AVHRR/3.

<b>Table D.4-5. Summary of NOAA-18 AVHRR Spectral Response Data (as a Function of Wavenumber) for Each Channel.</b>

Table D.4-6 contains NOAA-18 AVHRR/3 solar reflectance channel information such as equivalent width,  $w$ , effective central wavelength,  $\lambda_e$ , and in-band solar irradiance,  $F$ .

<b>Channel</b>	<b>Equivalent Width <math>w</math> (<math>\mu\text{m}</math>)</b>	<b>Effective Wavelength <math>\lambda_e</math> (<math>\mu\text{m}</math>)</b>	<b>Extraterrestrial Solar Irradiance in Band <math>F</math> (<math>\text{W}/\text{m}^2</math>)</b>
1	0.0793	0.634	130.3
2	0.2465	0.849	246.0
3A	0.0552	1.608	13.53

Note: These quantities are based on the solar irradiance data of *Neckel and Labs* (1984), which is a widely used source of such data.

Table D.4-7 contains the temperature-to-radiance coefficients for NOAA-18 AVHRR/3 Channels 3B, 4 and 5.

	$\nu_c$	A	B
Channel 3B	2659.7952	1.698704	0.996960
Channel 4	928.1460	0.436645	0.998607
Channel 5	833.2532	0.253179	0.999057

Tables D.4-8 and D.4-9 contain the corresponding spectral response values for NOAA-18 AVHRR/3 Channels 1, 2, 3A and Channels 3B, 4 and 5, respectively. Note: Negative response values were caused by system response noise and are to be ignored but are included in the table for completeness.
