Last Revision: January 28, 2009

Summary of Changes

The following is a list of documented changes made to this document to reflect changes in the Version 8 software or processing methodology.

Version 1.1	01/05/07 – TEK	Description:	Added Section 5 to describe new Monitoring routines added to Version 8 daily processing. Also added the Summary of Changes section to this document.
Version 1.2	05/30/07 – VRA	Description:	Added Section 5.4.7 to describe daily zonal average V8 files (CCR 3142).
Version 1.3	10/30/07 – DXU	Description:	Update description for SBUVPOQ and PCCF in SBUV V8 BUFR mnemonic table in Section 4.1.2 (PR1309).
Version 1.4	11/13/07 – V. Kapoor	Description:	Updated BUFR surface category values to match the BUFR descriptor table values. Section: 1.3.9 (PR1312).
Version 1.5	01/28/09 – L.Chen	Description:	New SBUV/2 V8 BUFR Table. Table 6 (CCR00357)

1.0 INPUT FILES

1.1 OOPS Version 6 daily Product Master File (PMF)

To produce the Version 8 daily PMF product, the SBUV Version 8 algorithm (V8) works as a follow-on processing system to the existing Version 6 algorithm (V6) and takes the V6 daily PMF as input. The V6 file is a sequential access binary data file, converted from the standard daily Product Master File (PMF) and containing only data records of the PMF.

Each V6 PMF data record has 207 4-byte words. The Table 1 lists the words used in V8 processing.

Table 1 V6 data record words used in V8 processing

Word.	Type	Content
1	I*4	Record ID (761 for data record)
2	R*4	Logical sequence number
3	R*4	Orbit number
4	R*4	Year at start of scan x 1000 + day of year at start of scan
5	R*4	Second of day
6	R*4	Sub-satellite latitude at beginning of scan
8	R*4	view latitude – Average for total ozone
9	R*4	View longitude – Average for total ozone
11-14	R*4	Photometer N-Value (340-313 nm)
15-18	R*4	Monochromator N-Value (340-313 nm)
19	R*4	Gain selection flag (340-306 nm)
20	R*4	Grating position error offsets for wavelengths 1-6
22	R*4	FOV average cloud top pressure (TOVS)
23	R*4	Pressure of reflective surface (TOVS)
42	R*4	Grating position error offsets for wavelengths 7-12
44	R*4	Terrain surface pressure
47	R*4	Dark current flag (n04 only)
48	R*4	view latitude – Average for profile
49	R*4	View longitude – Average for profile
50	R*4	Solar zenith angle – Average for profile
51-58	R*4	Photometer N-Value (252-306 nm)
59-66	R*4	Monochromator N-Value (252-306 nm)
67-68	R*8	Gain selection flags for each of eight wavelengths (252-306 nm)
156	R*4	Aerosol correction factor (n07 only)
206	R*4	Solar zenith angle at start of scan
207	R*4	Solar zenith angle at end of scan

For more information about the V6 output data files or daily PMF datasets, please see Section 9.7.2 of NOAA KLM User's Guide, or contact:

1.2 ROPES Version 6 orbital Product Master File (PMF)

To produce the Version 8 orbital PMF product, the SBUV Version 8 algorithm (V8) works as a follow-on processing system to the existing Version 6 algorithm (V6) and takes the V6 orbital PMF as input. The V6 file is a sequential access binary data file, converted from the standard orbital Product Master File (PMF) and containing only data records of the PMF.

Each V6 orbital PMF data record has 207 4-byte words. The Table 1 lists the words used in V8 processing.

1.3 Auxiliary input files

Besides the input observations from V6 PMF data file, V8 processing system also access multiple auxiliary input files.

1.3.1 Constants (**control/CONST.nxx**)

This file is in ASCII format and contains instrument calibration and algorithm constant parameters. A brief description to each line of data has been given in the file.

This constant data file is instrument dependent, a dedicated file must be provided for each satellite or instrument. The following is a sample constants file.

1.3.2 N-value look-up tables (**data/v8sbtable_multi.nxx**)

This file is in sequential binary format consisting of 13 records of data, each of which contains four look-up tables for one grating position offset. The four look-up tables are for calculating total intensity due to the atmospheric backscatter, single scattering intensity due to the atmospheric backscatter, transmittance for ground reflected radiation and average of fraction of radiation scattered back from the atmosphere, respectively. All these tables except the last one have dimensionality of (10, 21, 9, 4) corresponding to (solar zenith angle, profile, wavelength, pressure). The last table is not dependent on solar zenith angle, thus has dimension (21, 9, 4).

This constant data file is instrument dependent, a dedicated file must be provided for each satellite or instrument.

1.3.3 N-value sensitivity look-up tables (**data/v8sbndx.nxx**)

This file is in sequential binary format consisting of only one record of data, which contains four look-up tables for calculating N-value sensitivity. The four look-up tables are same as those for N-value except additional dimension of 12 is added for the unperturbed case followed by 11 cases perturbed in Umkehr layer 0-9 and 10, 11 and 12 combined.

This constant data file is instrument dependent, a dedicated file must be provided for each satellite or instrument.

1.3.4 A priori ozone profile climatology (**data/O3_CLIM13.DAT**)

This file is in sequential binary format consisting of only one record of data, which contains a priori ozone profiles in 13 Umkehr layers (12-0) for 18 10-degree latitude zones (from south to north) and 12 months.

1.3.5 A priori temperature profile climatology (**data/TM_CLIM13.DAT**)

This file is in sequential binary format consisting of only one record of data, which contains a priori temperature profiles in 13 Umkehr layers (12-0) for 18 10-degree latitude zones (from south to north) and 12 months.

1.3.6 Standard profiles in fine layers (**data/v8std81.dat**)

This file is in ASCII format and contains one standard temperature and 21 ozone profiles (3 for low latitude with total ozone from 225 to 275 DU; 8 for mid latitude with total ozone from 225 to 575 DU; and 10 for high latitude with total ozone from 125 to 575 DU) in 81 layers. The profile data consisting of 81 records, one for each layer, start from the third record. The records have format of (**f9.6, f7.2, 21f10.6**), corresponding to 1 scaled pressure (0 for the top of the atmosphere and 1 for the ground), 1 temperature and 21 layer ozone amounts.

1.3.7 Solar radiation reference look-up table (**data/solar_bass.dat**)

This file is in ASCII format and contains solar radiation reference data with high wavelength resolution (~0.05 nm). Each record is for one wavelength, including 7 parameters, i.e., wavelength, 3 ozone absorption coefficients, Rayleigh scattering coefficient, molecular anisotropy and solar flux.

1.3.8 Terrain height pressure data (**data/TERPRS.DAT**)

This file is in sequential binary format consisting of only one record of data, which contains 0.5 degree resolution terrain height pressure data with dimension (360, 720).

1.3.9 Surface category code (**data/SURFCAT.DAT**)

This file is in ASCII format consisting of 2160 records with 120 characters per record, which corresponds to a (360, 720) array of 0.5 degree resolution surface category codes (every 6 records hold data for one latitude zone).

The V8 binary surface category values are mapped to match the BUFR descriptor table values as follows:

0 = 0 (ocean)
1 = 3 (land)
3 = 5 (water bodies)
 $\geq 4 = 255$
2 is missing

1.3.10 Snow-ice cover data (**data/v8snocld/v8snowice.mon**)

There are 12 snow-ice cover data files in total, one for each month. These files are in ASCII format consisting of 3600 records with 18 floating point numbers per record, corresponding to a (180, 360) array of 1 degree resolution snow-ice cover data (every 20 records hold data for one latitude zone).

1.3.11 Cloud pressure data (**data/v8snocld/v8cldpres.mon**)

There are totally 12 cloud pressure data files, one for each month. These files are in ASCII format consisting of 3600 records with 18 floating point numbers per record, corresponding to a (180, 360) array of 1 degree resolution cloud pressure data (every 20 records hold data for one latitude zone).

1.3.12 Merged a priori ozone climatology (**data/mrgapprf.dat**)

This file is in ASCII format consisting of 2160 (10 total ozone amounts * 18 latitude zones * 12 months) climatological 11-layer ozone profiles. The file is organized as a sequence of profile data blocks. Each block consists of a header record with month and latitude zone information and 10 data records of 12 floating point numbers. The first number represents the total ozone amount of the profile, ranging from 125 to 575 DU, followed by 11 layer ozone values.

2.0 INTERMEDIATE FILES

None

3.0 OUTPUT FILES

The SBUV V8 processing system generates both daily and orbital output files in binary format, as well as daily and orbital output files in BUFR format (see Section 4 for BUFR description).

3.1 Version 8 daily output file

The V8 daily output data files are in sequential binary format. For each file, there are two header records, followed by all data records (around 1250 normally), and concluded with a trailer record. All records have same length of 2000 4-byte words or equivalently 8000 bytes. Header and trailer records are character strings, while the data records are 4-byte floating point arrays.

3.1.1 Header record I

Header record I contains general processing information such as instrument name, algorithm version, processing date and time. It also lists all lines of input control file. See Table 2 for the Header Record I layout.

Table 2 Header record I layout

Byte	Description	Sample
1-5	Spare	
6-13	Satellite name and flight model identifier	'SBUV-N18'
14	Spare	
15-21	Data Level	'LEVEL-2'

Byte	Description	Sample
22-33	Algorithm	‘BY V8SBUV’
34	Spare	
35-47	Version	‘VERSION 8.100’
48	Spare	
49-62	Program date	‘Feb, 26 2004’

1969-8000	Spare	

3.1.3 Data Record

The length of the data records was expanded to current 2000 4-byte words from original 500 words to accommodate averaging kernel and other information for retrieval error analysis. V6 data record is also included into V8 data record as a subset. See Table 4 for detailed data record layout.

Table 4 Data record layout

172-2000	Spare	99999.00000

3.2 Version 8 orbital output file

The V8 orbital output files have the same format as the V8 daily output files, but they are much smaller in size. The V8 orbital output data files are in sequential binary format. For each file, there are two header records, followed by all data records (around 90 normally), and concluded with a trailer record. All records have same length of 2000 4-byte words or equivalently 8000 bytes. Header and trailer records are character strings, while the data records are 4-byte floating point arrays. (See tables above).

4.0 VERSION 8 BUFR PROCESSING

4.1 Input Files

4.1.1 V8 Product Master File (PMF) file

The Version 8 BUFR encoder program, ‘pmfbufrv8.x’, takes a V8 binary file (daily or orbital) and converts it into a WMO standard BUFR format file.

4.1.2 BUFR Table

The program requires an input BUFR table that describes the layout of the BUFR subsets. These subsets are combined into BUFR messages of up to 10,000 bytes. Table 6 contains the BUFR input table, made up of three sections: Table A, Table B, and Table D.

Table 6. BUFR input table

4.2 Auxiliary input file

None.

4.3 Intermediate files

None.

4.4 Output files

The ‘pmfbufrv8.x’ program creates one output file with multiple BUFR messages in it. Each message consists of a number of subsets where each subset equates to one input record from the Version 8 binary file.

4.4.1 Daily V8 BUFR file

If the V8 input to the BUFR program was a daily binary V8 file, then the V8 BUFR output file will be a daily BUFR file, containing a whole day of data (typically about 1250 data records).

4.4.2 Orbital V8 BUFR file

If the V8 input to the BUFR program was an orbital binary V8 file, then the V8 BUFR output file will be an orbital BUFR file, containing one orbit of data (typically about 90 data records).

5.0 VERSION 8 Daily Monitoring Processing

5.1 Input Files

5.1.1 V8 Product Master File (PMF) file

The five programs run for monitoring (pmfv8pct.x, pmfv8laymon.x, pmfv8sbuvoz.x, pmfv8zone.x, pmfv8zstat.x) use the PMF file as input to update the necessary monitoring files.

5.2 Auxiliary input file

None.

5.3 Intermediate files

None.

5.4 Output files

Several output products are updated daily from the monitoring scripts that are run after the V8 daily processing.

5.4.1 Layer Monitoring file (**data/LAYMON[1,2,4]**)

File contains ozone values for the 21 layers for 3 different latitude regions (Northern Hemisphere, Tropical, and Southern Hemisphere). The file is appended to for each new day and is used as input for the layer monitoring webpage graphics.

5.4.2 PMF Percentages Monitoring file (**data/PCPMFD[1,2,4]**)

File contains the percentage of total and profile ozone products produced (percentage of good products made for all input data received) for the day.

5.4.3 SBUV Zonal Averages file (**N[1,2,4]ZONE.SBUV**)

File contains total ozone statistics for 12 different latitude ranges for SBUV for each day.

5.4.4 Zonal Averages file (**N[1,2,4]ZONE**)

File contains zonal averages and sample sizes for three different latitude regions for each day.

5.4.5 Latitude Coverage file (**LATCOV[1,2,4]**)

File contains the SBUV maximum and minimum latitude coverage for each day.

5.4.6 TOVS Zonal Statistics file (**TOTOZ[1,2,4]**)

File contains zonal averages for TOVS data for each day.

5.4.7 SBUV /2 Zonal Averages files (**data/PMF[1,2,4]V8TODY,** **data/PMF[1,2,4]V8YEST**)

File contains total ozone, 21 layer retrieved ozone profile averages and sample sizes for 18 different latitude ranges for SBUV/2 each day.
