SUMMARY

The May Sea Ice Outlook report for the September 2008 sea ice extent is based on a synthesis of 19 individual outlooks from the international arctic science community. The outlook for the pan-arctic sea ice extent in September 2008 indicates a *continuation of the recent trend of sea ice loss*.

Sea Ice Extent Outlook for September 2008
(Millions square kilometers)

- International effort (led by EU DAMOCLES & US SEARCH programs, coordinated by Jim Overland) to anticipate, track and evaluate Arctic seasonal ice evolution in the summer of 2008
- Roughly two dozen contributors: statistical, heuristic, numerical and other models, discussion & integration of observations
- Continuation for 2009 underway - visit web site & contribute!

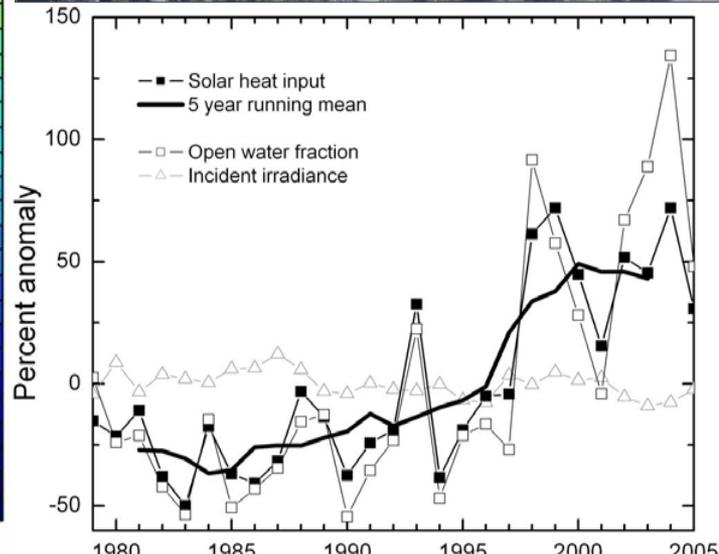

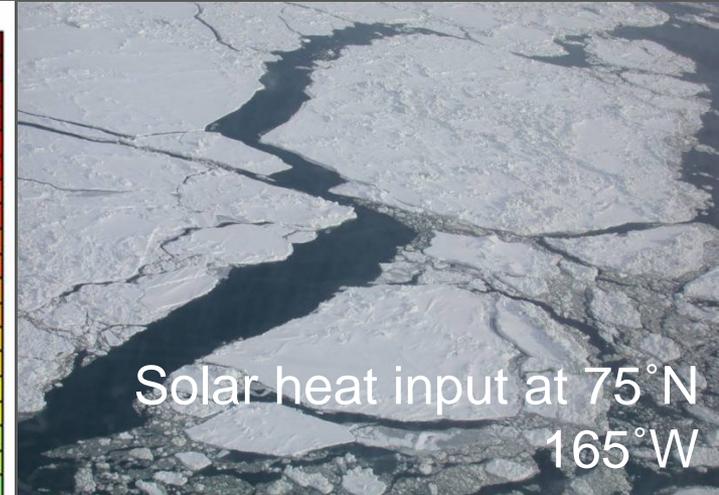

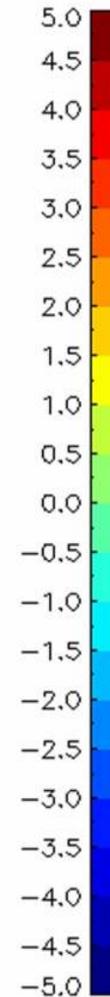

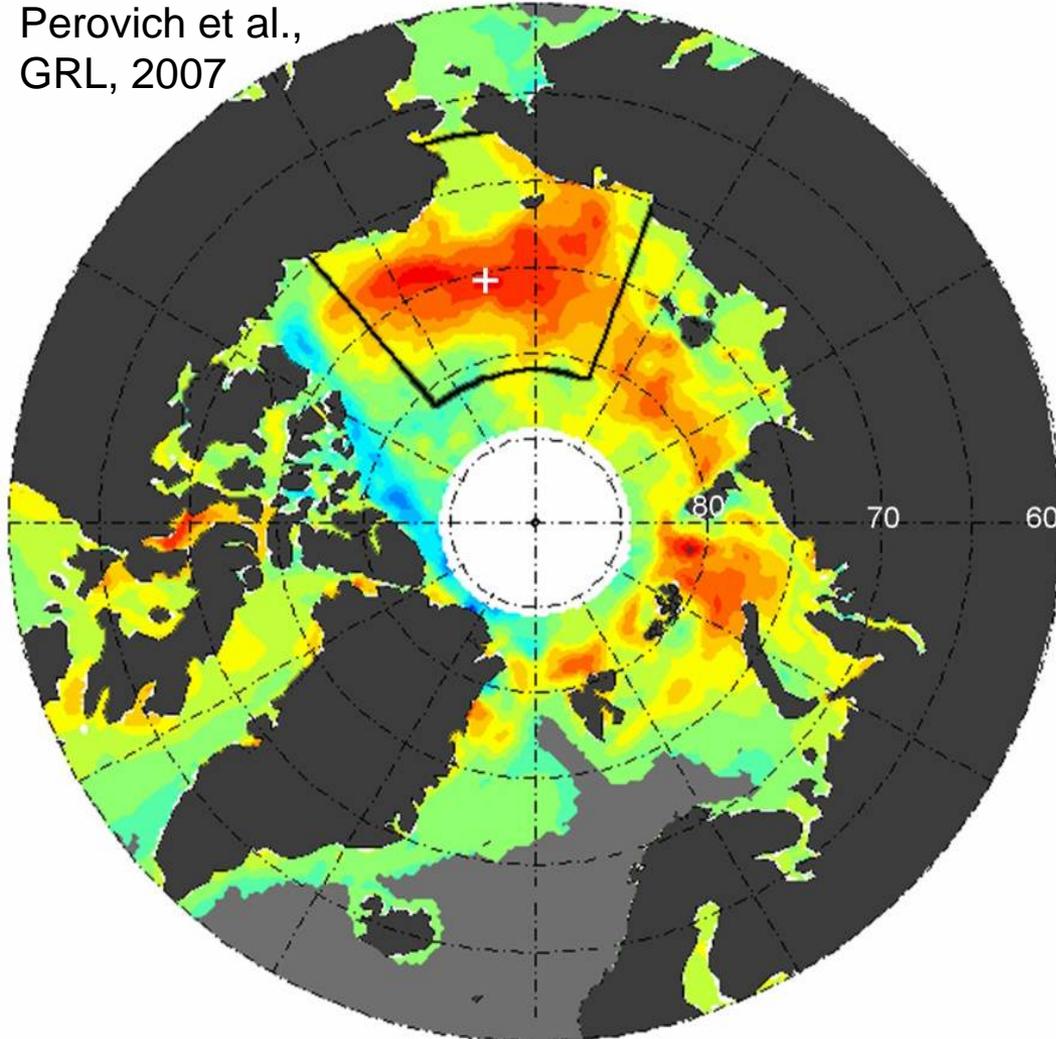

Key considerations of forecasters

- Importance of preconditioning (heating of ocean in preceding year)
- Fate of first-year ice through melt cycle
- Vagaries of the weather: May through August

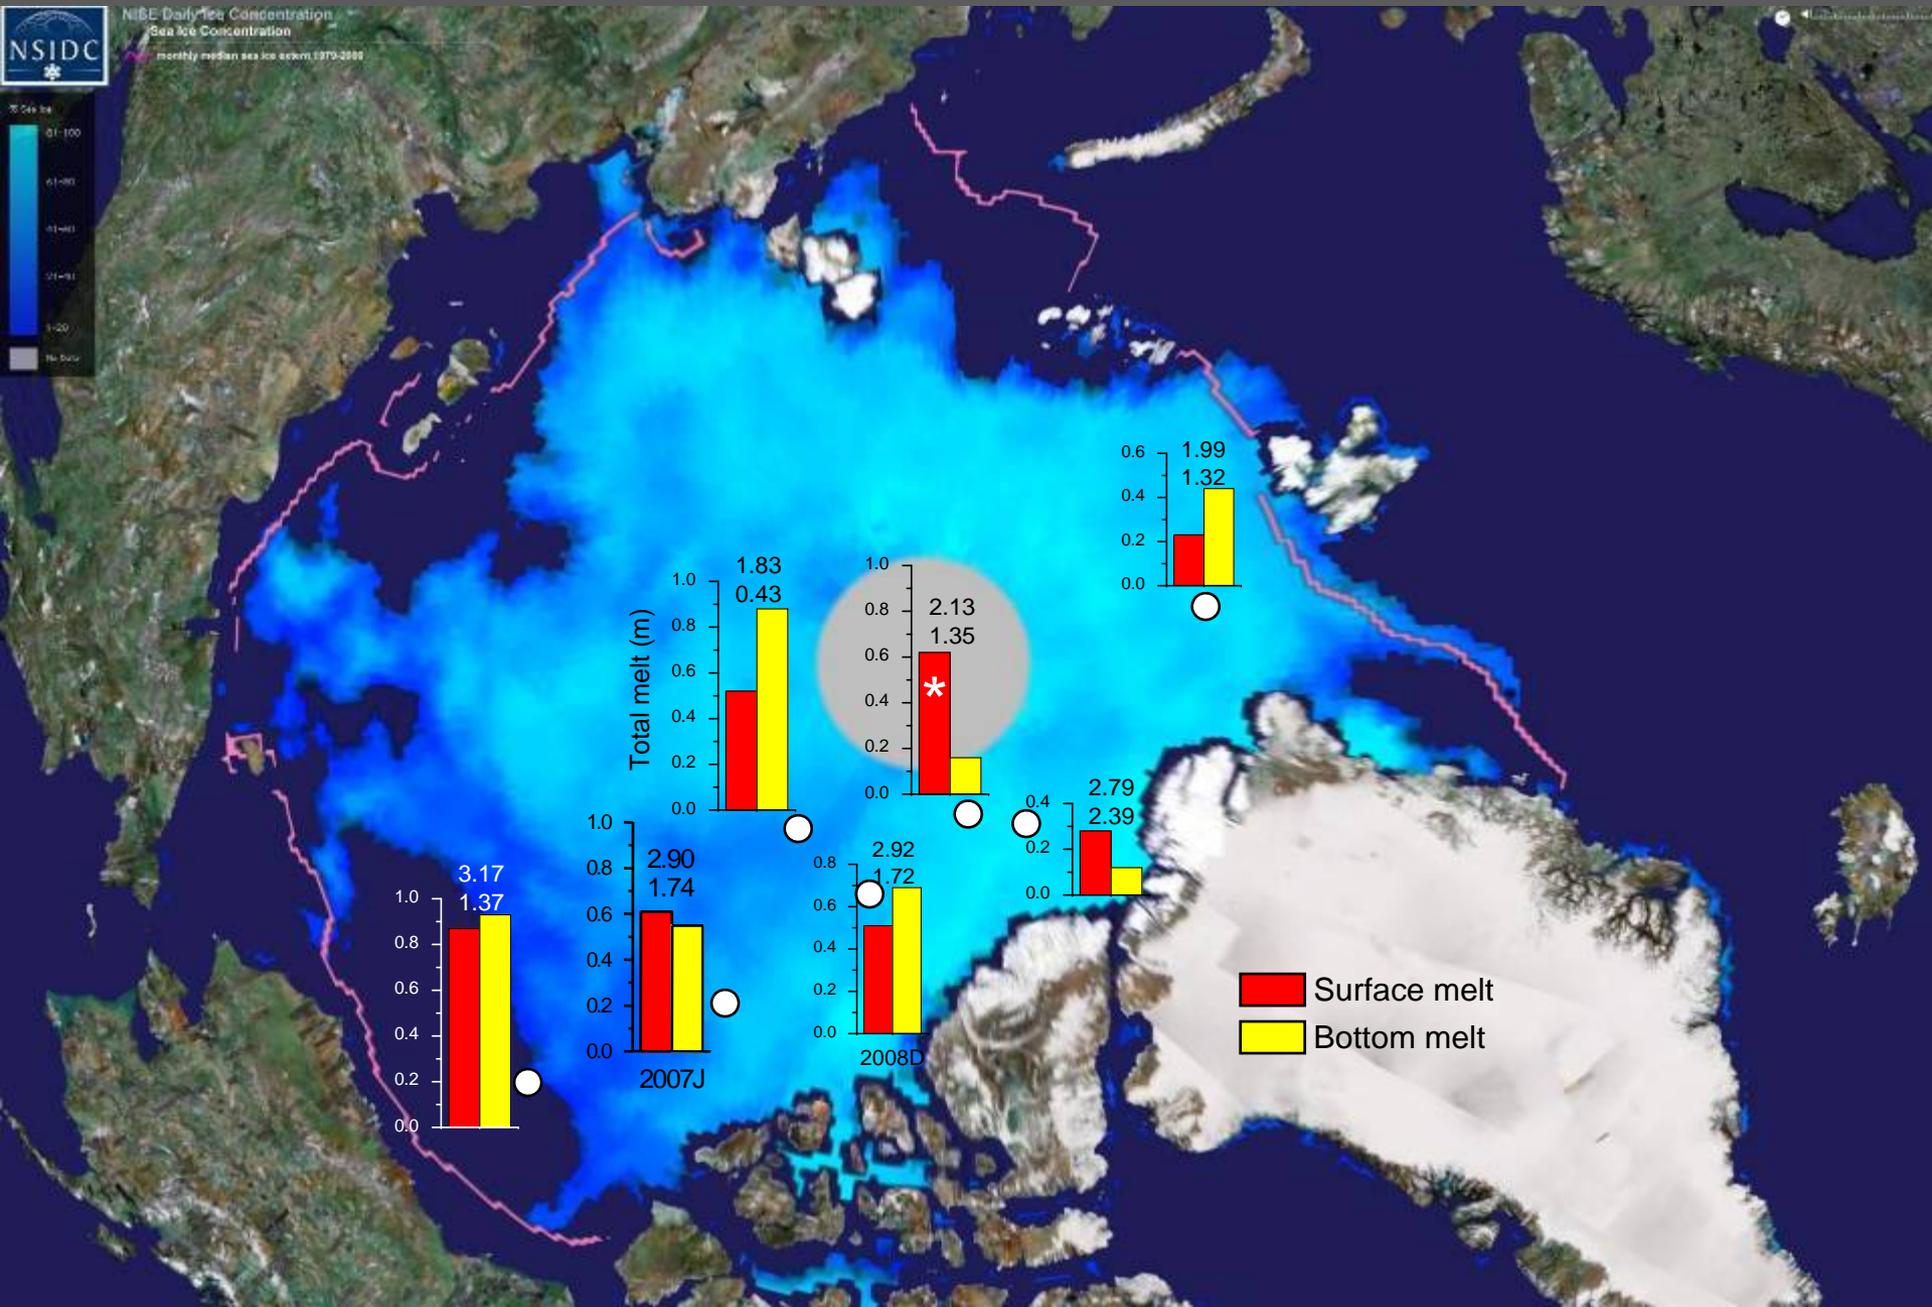

Solar heat into surface waters in pack ice: Ice-albedo feedback hard at work?

Solar heating linear trend (% yr⁻¹, 1979-2005)

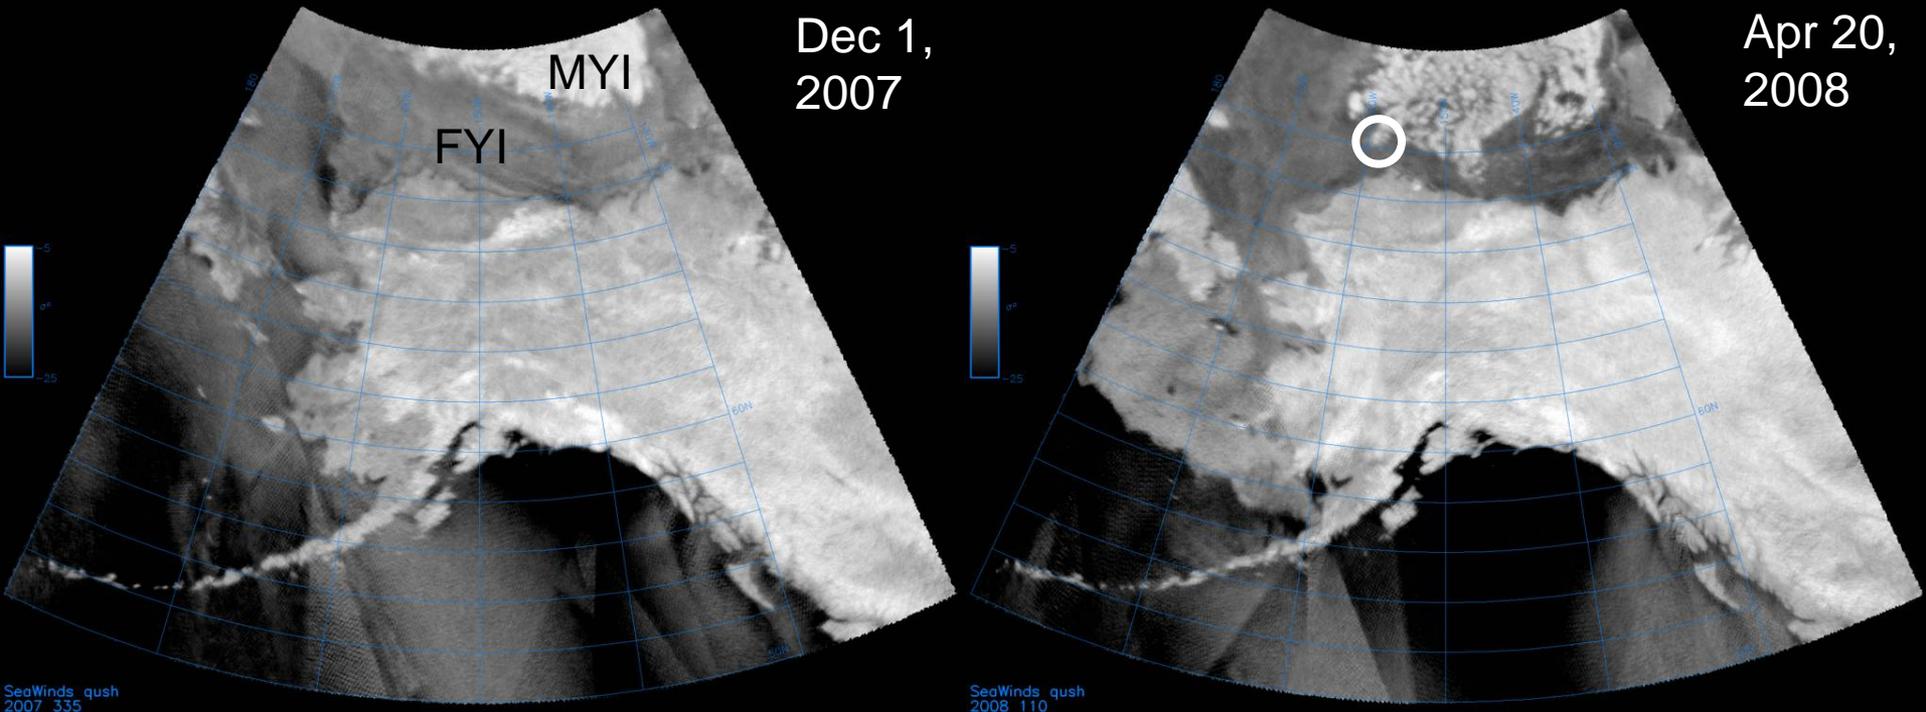

Perovich et al.,
GRL, 2007

2008: Results from IPY mass-balance buoys (Perovich et al.)

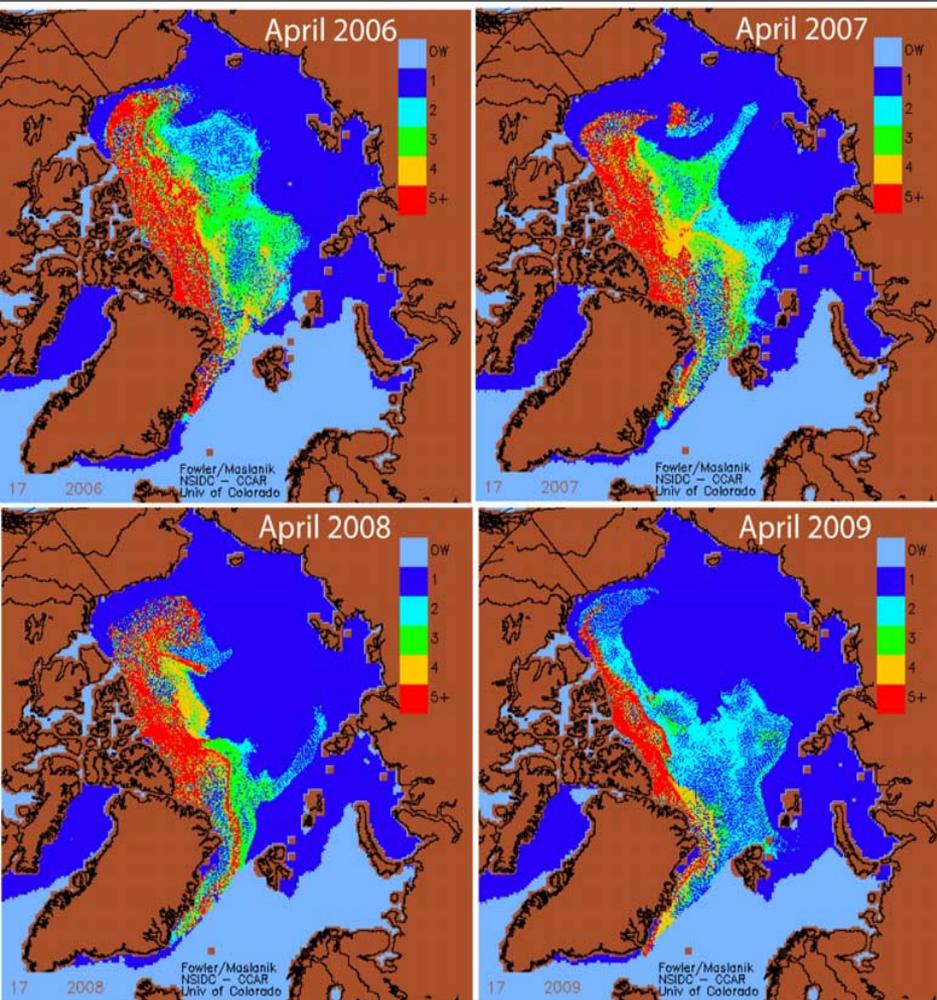

Faster ice movement still advects some thick, old ice north of Alaska

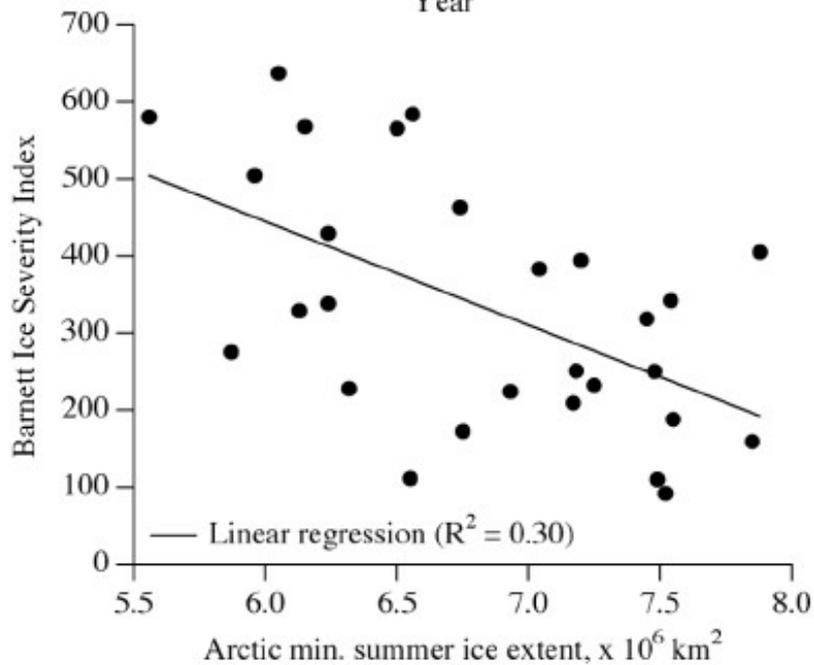

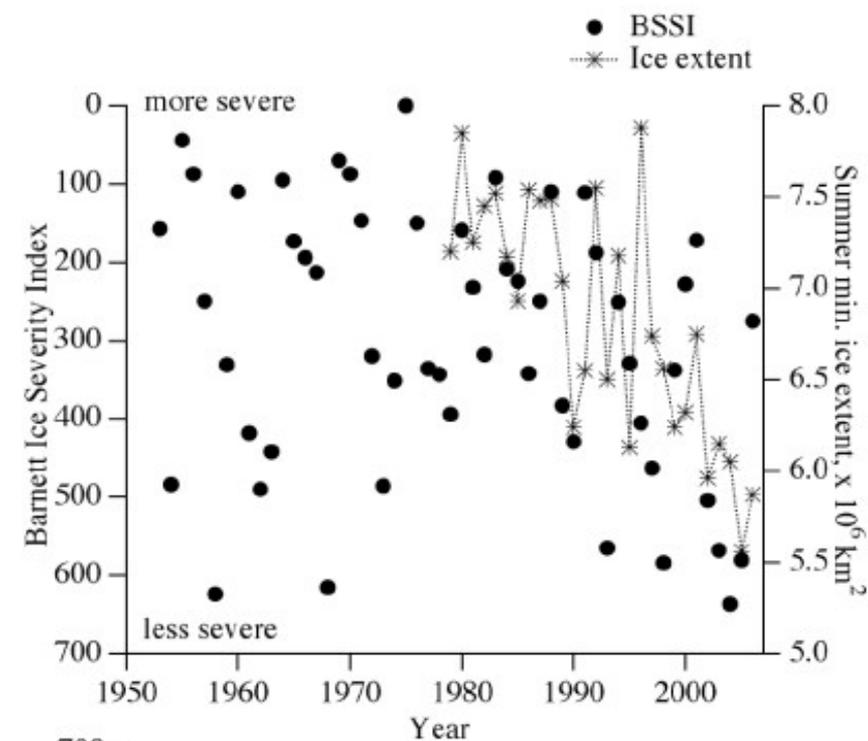

- Ice circulation patterns & increased ice velocities help bring old (multiyear) ice to Beaufort Sea coast
- Measurements off Barrow in April 2008: 5-7 year old, 3.5 m thick ice from High Canadian Arctic
- April 2009: First-year ice thicker than 2008, less multi-year ice of comparable thickness, though possibly younger age (to be confirmed)

Sea Ice Outlook 2009: Ice age distribution

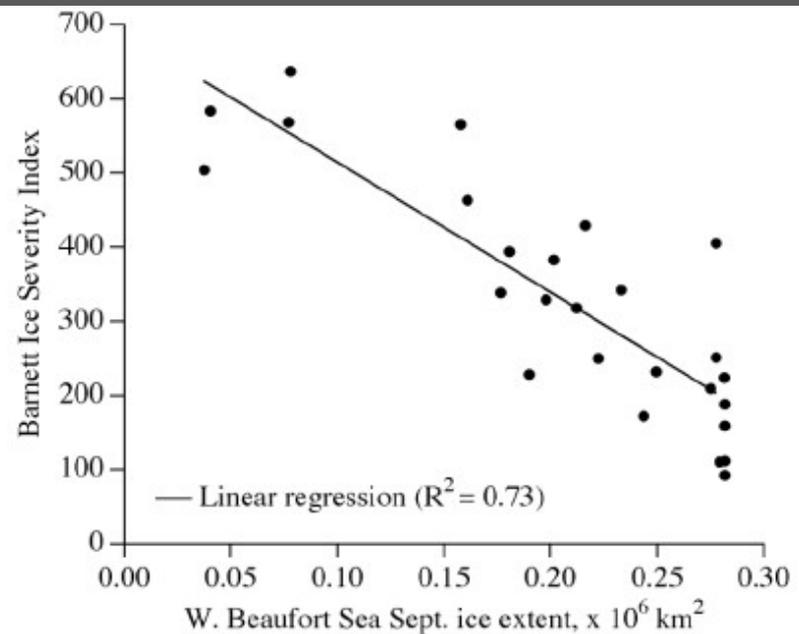

- Maslanik & Fowler: Age distribution derived from ice velocity fields (obtained from passive microwave data)
- 2009 has the smallest proportion of old ice since 1979
- Large variability and big reduction in ice age in Alaskan Arctic
- Reduction in multi-year ice impacts marine mammals and subsistence hunters

How do regional and local ice conditions scale with pan-Arctic ice variability?

- September minimum ice extent explains 30 % of observed variance in Barnett Ice Severity Index
- W Beaufort Sea Sept. ice extent explains 73 %

Correlation matrix for different Arctic and northern Alaska sea-ice variables

	Arctic annual minimum ice extent	West Beaufort September Ice extent	Barnett Ice Severity Index (BSI)
West Beaufort September Ice extent	0.699⁺		
BSI	-0.55	-0.853	
First landfast ice at Barrow	0.246	-0.255	0.611
First stable landfast ice at Barrow	0.075	-0.032	0.257
Landfast ice break-up at Barrow	0.362*	0.642*	-0.769*
First landfast ice at Prudhoe Bay	-0.078	-0.535	0.577
First stable landfast ice at Prudhoe Bay	-0.307	-0.765	0.884
Landfast ice break-up at Prudhoe Bay	0.221*	0.575*	-0.604*

+ Correlation coefficients r significant at 99%-level are shown in bold, those significant at 95%-level are shown in italics (two-tailed Student t test)

* *evaluation for minimum ice extent in the subsequent rather than the preceding season*

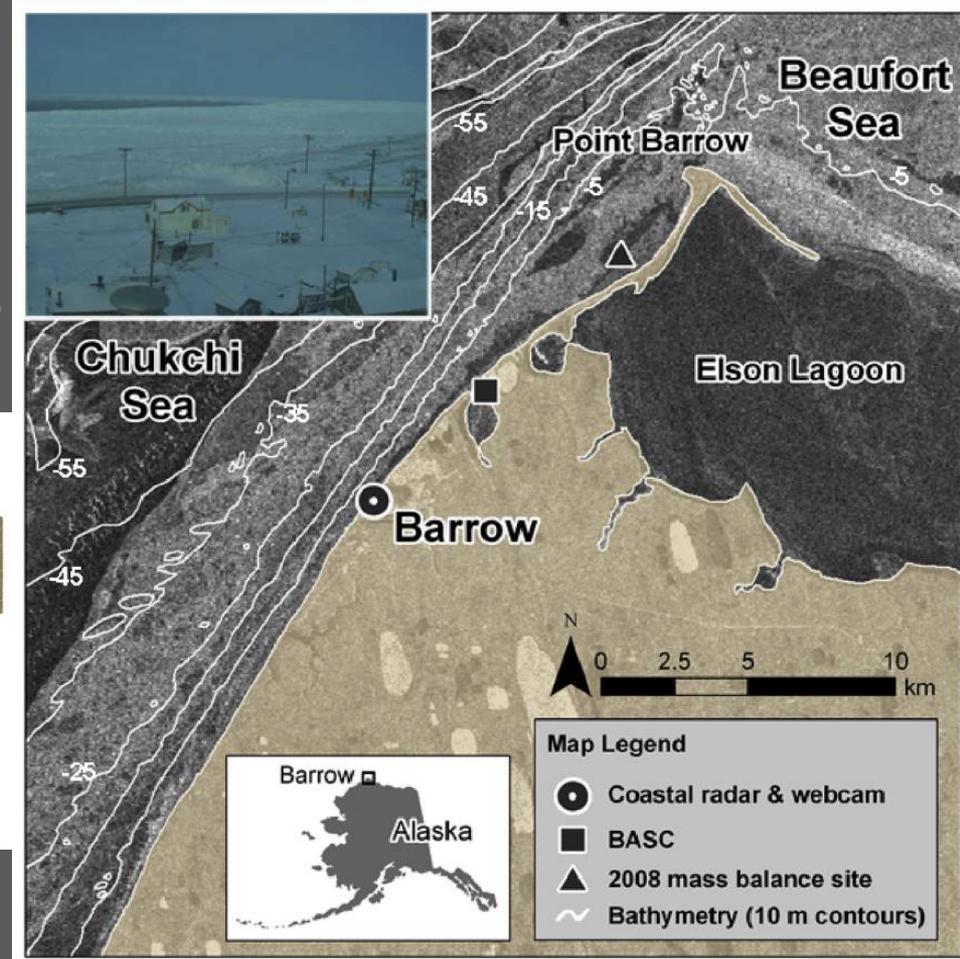

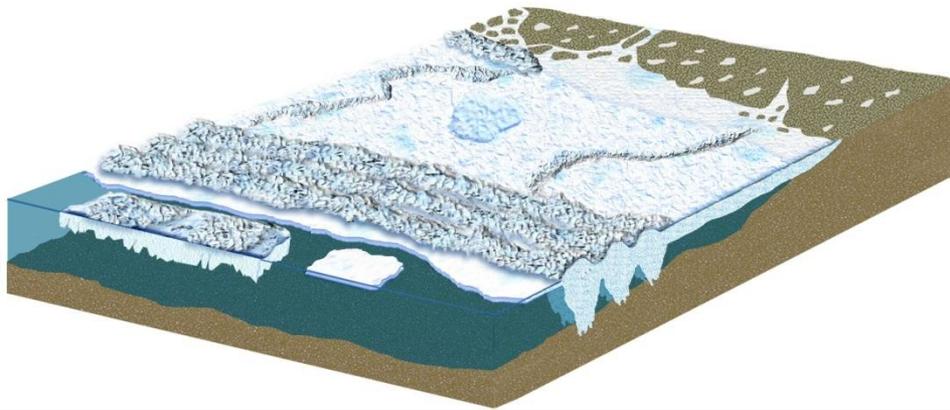

- Use of sea ice as platform by marine mammals (walrus, seals)
- Use of sea ice as a platform for hunting & butchering by Iñupiaq & Siberian Yupik hunters

Photos: Winton Weyapuk Jr.

Local conditions at Barrow, AK

www.sizonet.org

- *Remote sensing* (km-scale)
- *Coastal radar* (sub-km scale)
- *Thickness and topography* (sub-km)
- *Ice mass-balance site* (10s m-scale)
- *Local Iñupiaq ice observations* (J. Leavitt, A. Brower Sr. and others)

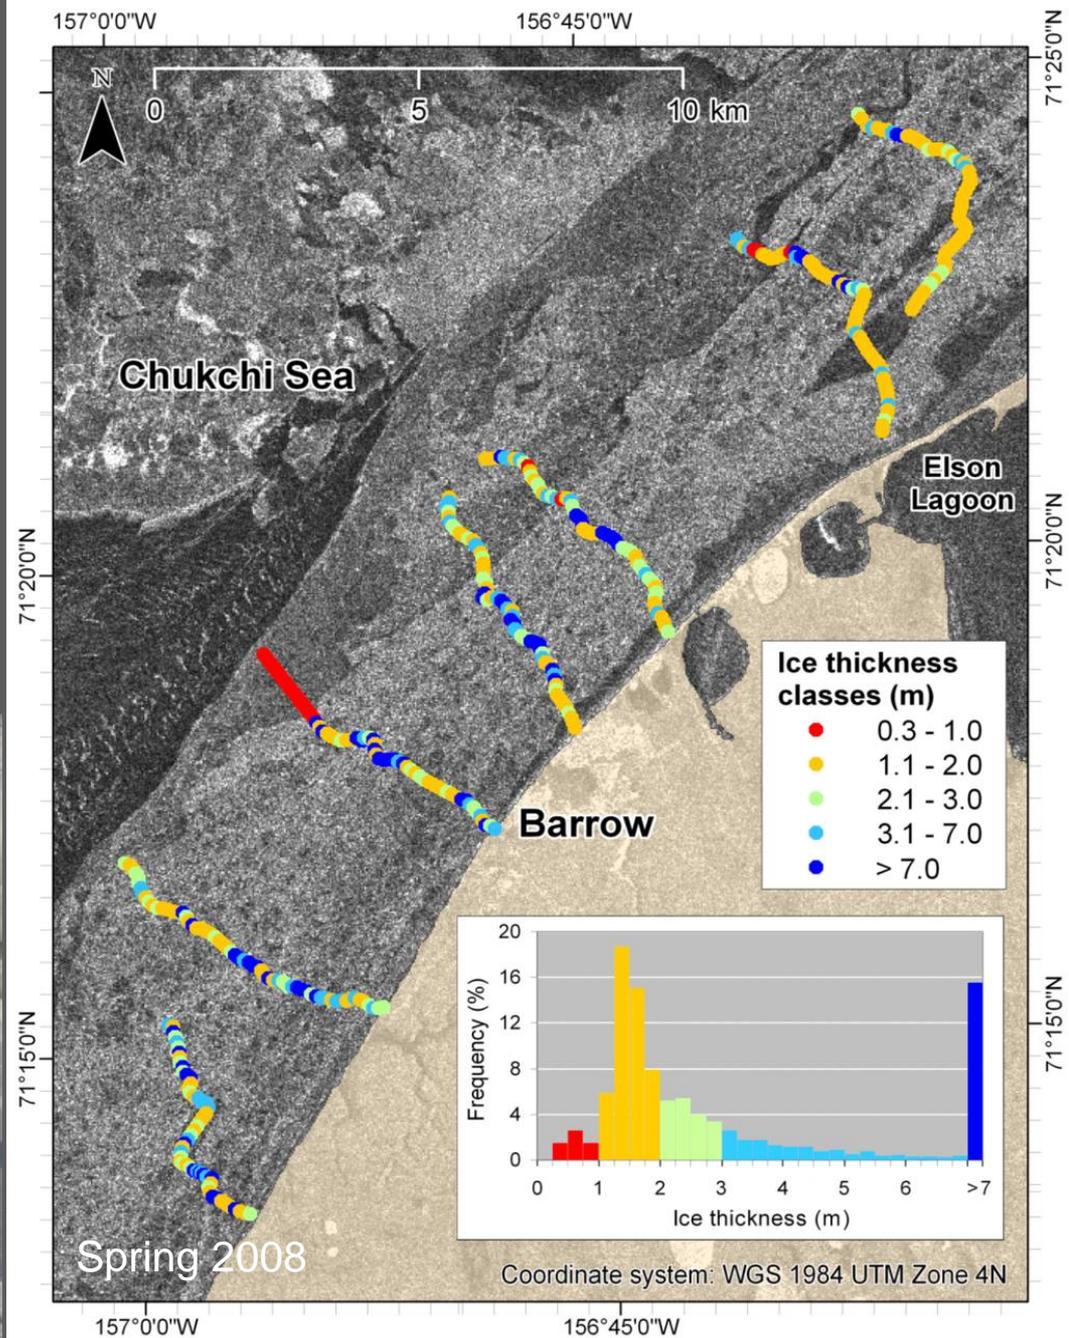

- *Seasonal Ice Zone Observing Network (SIZONet)*
IPY Project with support from NSF-AON and NOAA
AK Ocean Observing System

M. Druckenmiller et al.

Tracking ice use & ice stability

- Trails for hunting camps established annually
- Thickness (EMI) & surf. elevation (DGPS) data collected trail on system
- Interviews with hunters

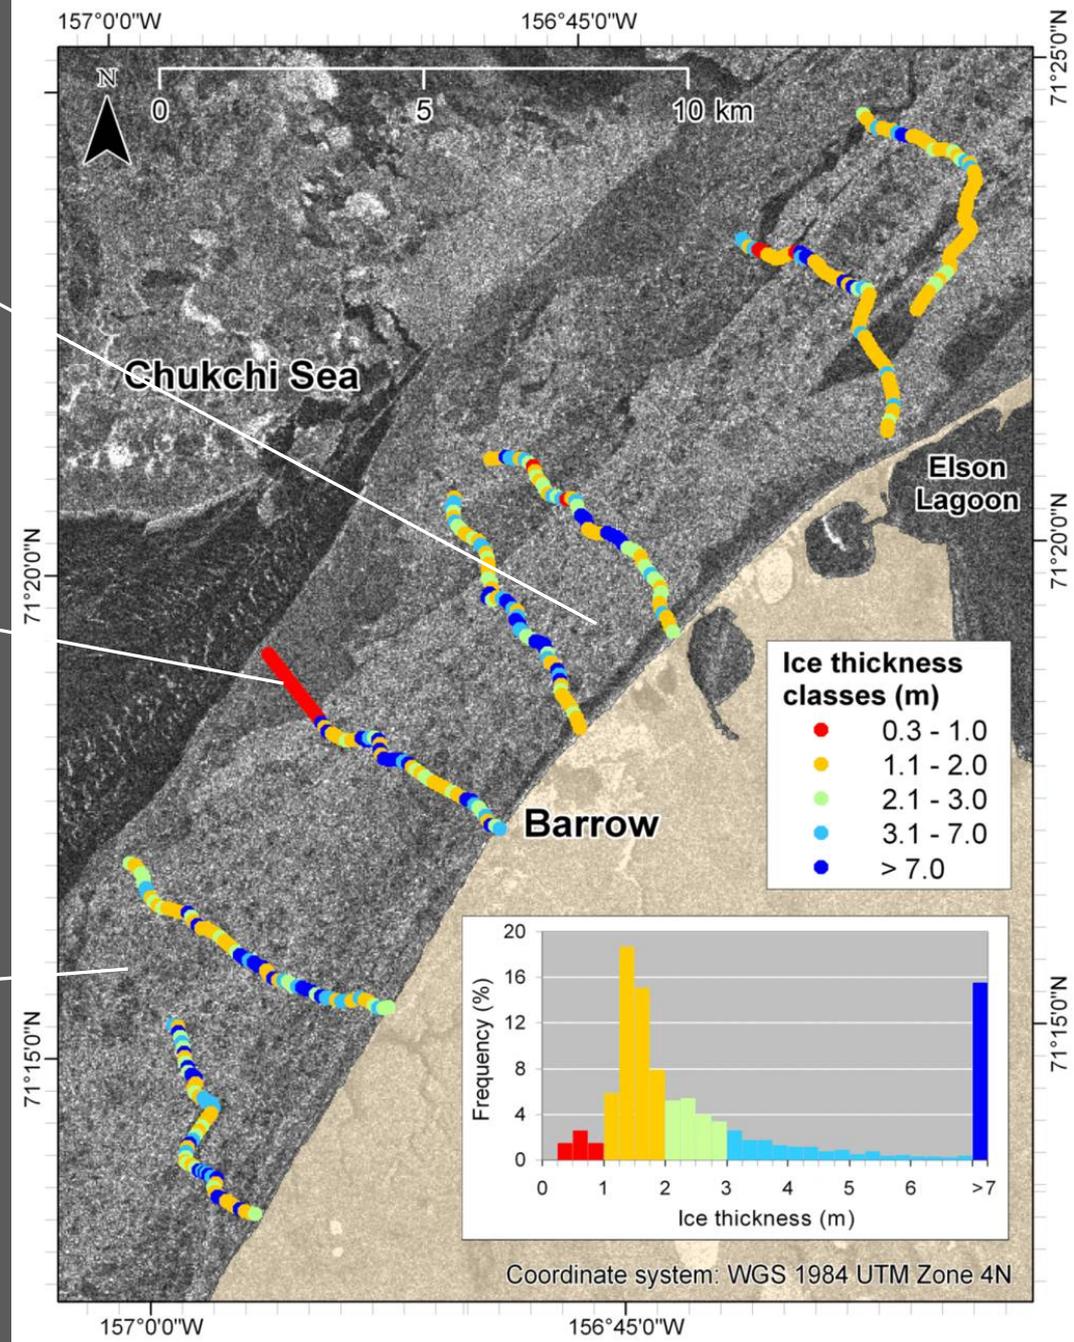

Coastal sea-ice change during past two decades

Ice is rougher but fewer large pressure ridges, reducing landfast ice stability

Thinner ice impacts load-bearing capacity & harvesting of whales

Lack of multiyear ice & more dynamic ice pack reduce landfast ice stability and impact access to marine mammals

Can ice break-up be predicted?

17 May 2007

Barrow Sea Ice Cam Thu May 17 2007 14:00:07

- Case study at Barrow
www.gi.alaska.edu/BRWICE
- Ice decay and melt-out driven by solar heat input melting level landfast ice matrix

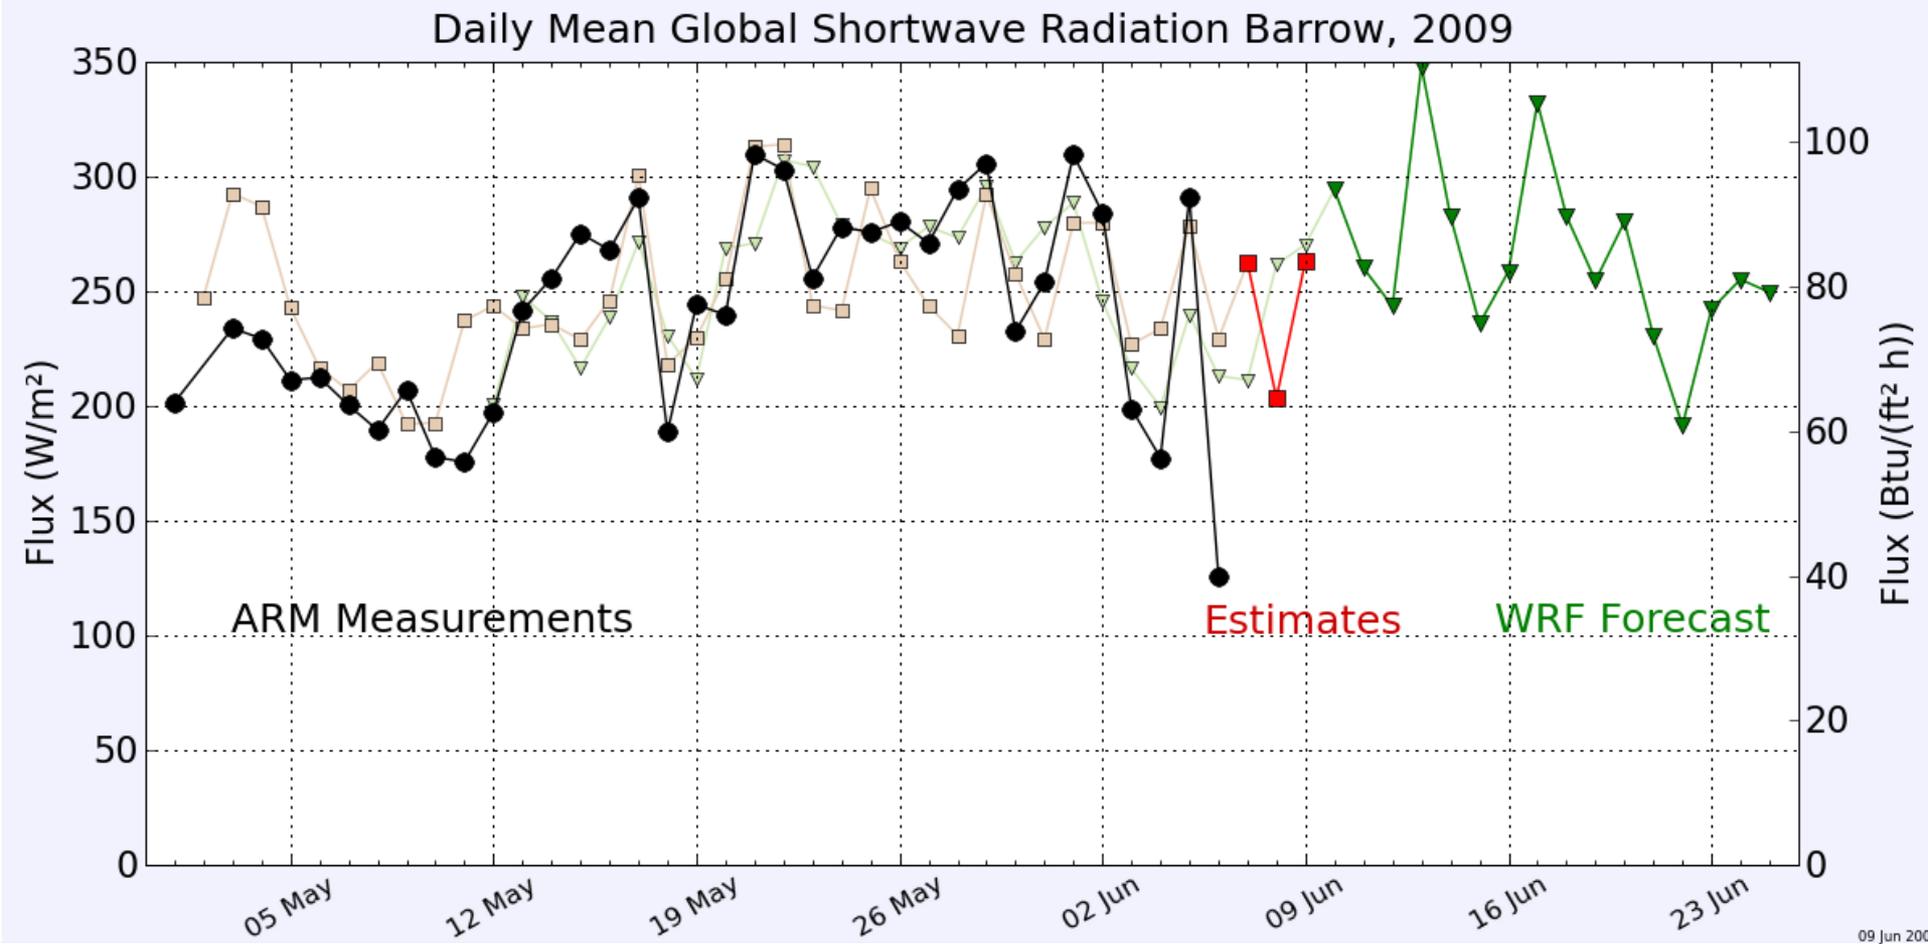

25 June 2007

Barrow Sea Ice Cam Mon Jun 25 2007 14:01:18

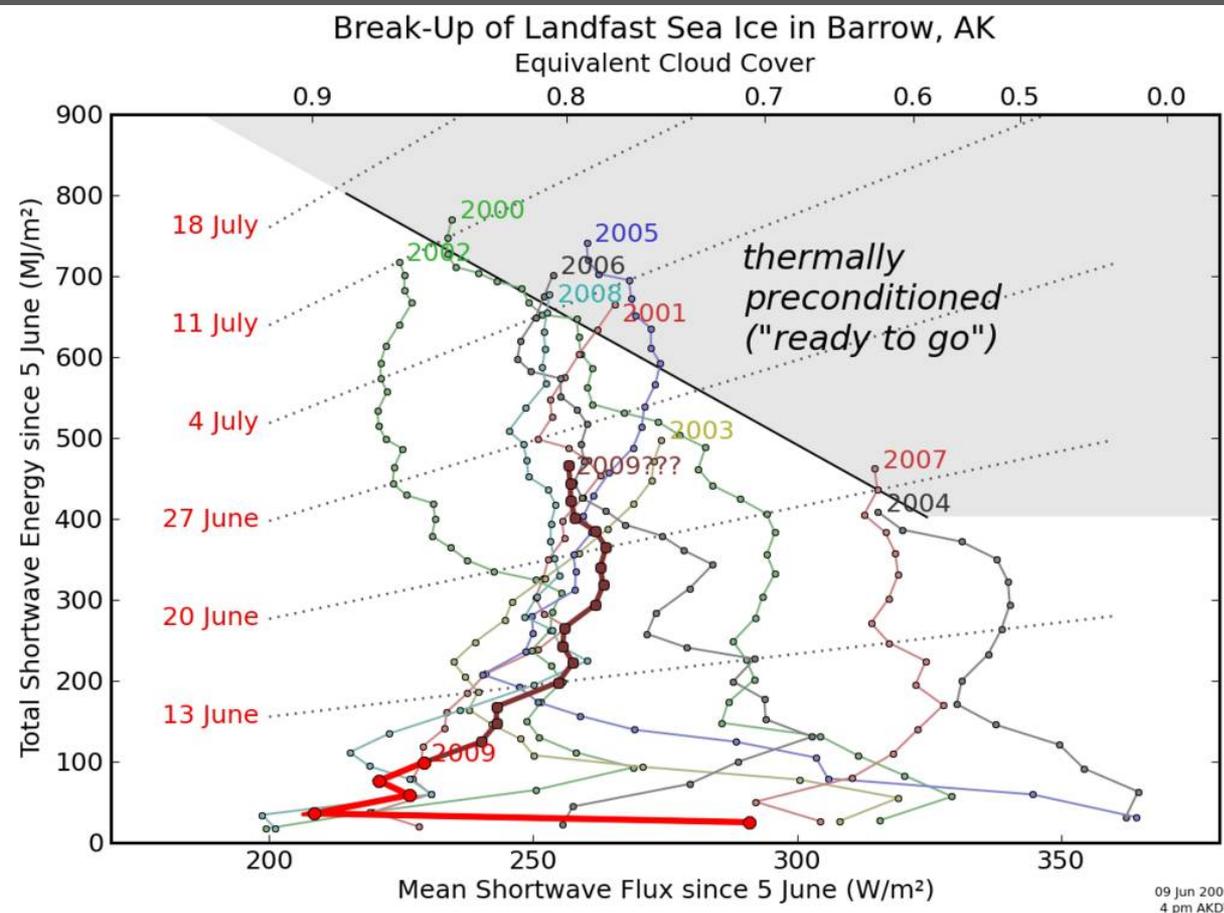

- Ice break-up driven by sealevel variations and currents, dislodging and removing grounded pressure ridges

2009 Solar radiation at Barrow

09 Jun 2009

Can ice melt-out be predicted?

- Case study at Barrow
- Ice decay and melt-out driven by solar heat input melting level landfast ice matrix

Petrich & Eicken:

www.gi.alaska.edu/snowice/sea-lake-ice/Brw09/forecast/

Sea ice predictability: present status

- Pan-Arctic minimum ice extent appears to have predictability several months in advance
 - ice age distribution
 - preconditioning
- Correlations between pan-Arctic extent and local conditions are not high
- Melt-out of coastal ice appears to have short-range (~weeks) predictability, with accumulated solar flux as a key predictor
