IST is the radiating, or "skin", temperature at the ice surface. It includes the aggregate temperature of objects comprising the ice surface, including snow and melt water on the ice.

Ice surface temperature (IST) composite from all overpasses over the Arctic on March 1, 2015. From Liu et al., 2015.
From U. Wisc/CIMSS near real-time VIIRS ice products, based on JPSS Enterprise algorithms

Summary of the VIIRS IST EDR

- The VIIRS Ice Surface Temperature (IST) EDR provides surface temperatures retrieved at VIIRS moderate resolution (750m), for Arctic and Antarctic sea ice for both day and night.

- The baseline split window algorithm statistical regression method is based on the IST algorithm of Key and Haefliger (1992) and Key et al. (1997):

\[
\text{IST} = a + bT_{11} + c(T_{11} - T_{12}) + d(T_{11} - T_{12})(\sec(z) - 1)
\]

  \(T_{11}\) and \(T_{12}\) : TOA TB’s for ~11 and 12 μm bands
  \(z\): satellite zenith angle
  a, b, c, d: regression coefficients.

- Threshold Measurement Uncertainty = 1K over a measurement range of 213–275 K.

---

During the first week of April 2016 a significant surface warming event was observed over Baffin Bay (left). Mean surface temperatures over the area from The NCEP Climate Forecast System Version 2 (CFSv2) Reanalysis ranged from -30 to -10º C on 1 April 2016 with anomalies of -10º C in the south to +5º C in the north. By 7 April 2016 the mean surface temperatures rose by 10 to 20º C with surface temperature anomalies of up to 20º C off the west central coast of Greenland.

Top row is daily mean 2-meter temperatures for 1 April 2016 left and 7 April 2016 right. Bottom row is daily mean temperature anomaly. Data from CFSv2 provided by the University of Maine Climate Change Institute Climate Reanalyzer (http://cci-reanalyzer.org/)
April surface warming event over Baffin Bay

The NPP VIIRS Ice Surface Temperature (IST) Enterprise algorithm observed the same warming event over the 1 to 6 April period (left). IST was in the range of 245-265 K on 1 April, warming to 255-275 K by 6 April. A strong ridge of high pressure developed over Greenland, allowing warm air from the south to be advected over the Baffin Bay region. On a related but broader scale, a record-breaking level of surface melt on the Greenland ice sheet has been observed for this early in the year. By R. Dvorak

VIIRS IST (green) and KT-19 IST (black) for all coincident IceBridge flights with cloud-free observations over the Arctic (March-May 2014) and Antarctic (October-November 2012-13).

From: *Yinghui Liu, Jeffrey Key, Mark Tschudi, Richard Dworak, Robert Mahoney, and Daniel Baldwin, 2015: Validation of the Suomi NPP VIIRS Ice Surface Temperature Environmental Data Record, Remote Sens. 2015, 7, 13507-13527; doi:10.3390/rs71013507*
VIIRS IST vs. buoys

Scatter plot of surface air temperature from Arctic buoys and NPP VIIRS IST from August 2012 to June 2014, with the thick line as the 1 to 1 ratio line, and thin line as the linear regression.

From Liu et al., 2015.

- total cases: 217
- bias = -3.6
- RMSE = 3.8
- $R^2 = 0.87$
Suomi-NPP VIIRS IST – NASA product

- Utilizes split window:

\[ \text{IST} = a_0 + a_1 T_{M15} + a_2 (T_{M15} - T_{M16}) + a_3 (T_{M15} - T_{M16}) (\sec(z) - 1) \]

- Initial code generated from MODIS code by NASA’s Science Investigator-led Processing System (SIPS)
- Code being updated for VIIRS (calibration coefficients, etc.)
- New Quality Flags to be added
- Inter-comparison: MODIS, NCEP
- Validation: IceBridge, buoys

Left: VIIRS IST (K) from the NASA VIIRS IST product
Sept 12, 2014, 21:10 UTC
Beaufort Sea, AK
NASA VIIRS Sea Ice Cover Product

- NASA VIIRS Sea Ice Cover by Reflectance
- Follow-on from MODIS (D. Hall & G. Riggs)
- Code generated by NASA SIPS
- In development by M. Tschudi (CU), George Riggs (SSAI)
- Reflectance-based during daytime, nighttime uses the IST product
- Sea ice by reflectance utilizes the NDSI:
  - NDSI = \[\frac{\text{R}(I1) - \text{R}(I3)}{\text{R}(I1) + \text{R}(I3)}\]
  - \(\text{R} = \text{reflectance}, \text{VIIRS } I1 \ (0.64\text{um}), \text{VIIRS } I3 \ (1.61\text{um})\)
- Ice cover is mapped:
  - Snow-covered ice:
    - NDSI > thold and \(\text{R}(I1) > \text{thold2}\)
    - Thin ice (<10 cm, no snow cover)
      - IST – SST > thold
  - Validation: IceBridge, Digital Globe, …
  - Intercomparison: AMSR-2, IDPS Sea Ice Age, VIIRS Sea Ice Concentration, NDE Sea Ice Thickness

NASA VIIRS Sea Ice Cover
April 7, 2015, Beaufort Sea
Conclusions

- VIIRS IST algorithm in most cases meets the requirement of 1K measurement uncertainty
- The VIIRS IST has detected early warming in Baffin Bay which parallels other observations.
- Improvements in the VIIRS IST performance have been realized as the VIIRS Cloud Mask matures
- NASA’s Sea Ice Extent and IST products will provide continuity with the MODIS product
