Using ACSPO VIIRS data in CMC SST analyses

Dorina Surcel Colan
National Prediction Development Division, Meteorological Service of Canada, Environment and Climate Change Canada, Canada

4th STAR JPSS Annual Meeting
14-18 August 2017, College Park, MD, USA
Introduction

• In 2016 CMC run 2 SST analyses using Suomi-NPP VIIRS retrievals:
  – 0.2° analysis assimilating 3 AVHRR, VIIRS and AMSR2 (v2)
  – 0.1° analysis assimilating 4 AVHRR, VIIRS and AMSR2 (v3)

• Both analyses assimilate in situ observations (ships, drifting buoys and moored buoys) and ice data

• SST analysis refers to a depth temperature (foundation SST) without diurnal variability

• CMC SST analyses were available on PO.DAAC
VIIRS SST Product

- VIIRS dataset used in SST products is produced by NOAA/NESDIS using Advanced Clear-Sky Processor for Oceans - ACSPO (Petrenko et al. 2014)
- ACSPO VIIRS retrievals: L2P format – 21G/day – until October 2016 and L3U data (~2.4 G/day) afterwards
- No SSES bias and standard deviation from ACSPO VIIRS are used, the analysis has his own satellite bias correction algorithm.
Evaluation of CMC SST for 2016

• All verifications are done against independent measures from Argo floats
• Observations are used only if they are between 3 m and 5 m and within four standard deviations of the climatology
Performance of CMC SST

The 0.1deg analysis performed better than 0.2 deg. analysis in 2016. GMPE product improved in April 2016 (VIIRS used in OSTIA?)
In 2016 GMPE product used 0.2deg CMC SST but not 0.1deg CMC SST
ACSPDO VIIRS from PO.DAAC

- NOAA/NESDIS provided VIIRS 2.40 L2P and L3U format
- CMC SST analyses had used ACSPDO VIIRS in L2P format since 2014.
- From 26 Sept. to 4 Oct. 2016 data feed for ACSPDO VIIRS L2P from PO.DAAC had been interrupted
Without VIIRS data CMC SST has larger standard deviation compared to ARGO; VIIRS L3U have been used after Oct.4
ACSP PO VIIRS 2.40 L2P vs L3U

Similar performance for 0.1 deg. CMC SST when VIIRS ACSPO in L3U format are used
Changes in CMC SST in 2016

Smaller bias and standard deviation when using observational data with higher precision (two decimals instead of one decimal)
Using SSES only for ACSPO VIIRS L3U has very small impact in the analysis bias
Conclusions and future plans

- CMC SST analyses continue to perform well in 2016
- As 0.1 deg. CMC SST has better performance than 0.2 deg. CMC SST (v2) and is an operational product, 0.2 deg. analysis using VIIRS has been discontinued in March 2017
- At this moment no CMC SST is used in GMPE, 0.1 deg. analysis to be introduced soon
- Using VIIRS L3U data does not affect the quality of the analysis and the data are easier to handle (2.4G/day compare to 21G/day)
- A new version of 0.1 deg. CMC SST using higher precision for the observational data and an improved ice analysis will be implemented early in 2018
- This new version will be reprocessed for the last 5 years (at the beginning) and the data will be made available early in 2018.
