

# Representing Aerosol-Cloud Interactions Using Machine Learning Techniques in Energy Exascale Earth System Model

**Po-Lun Ma**

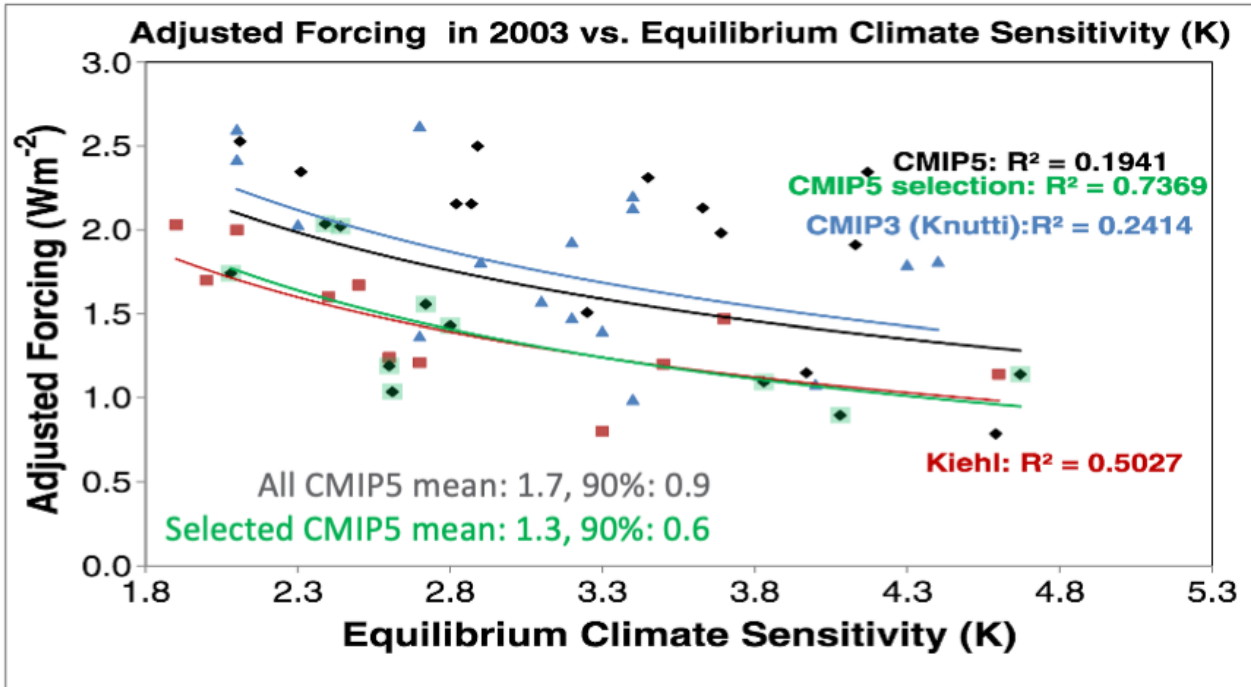

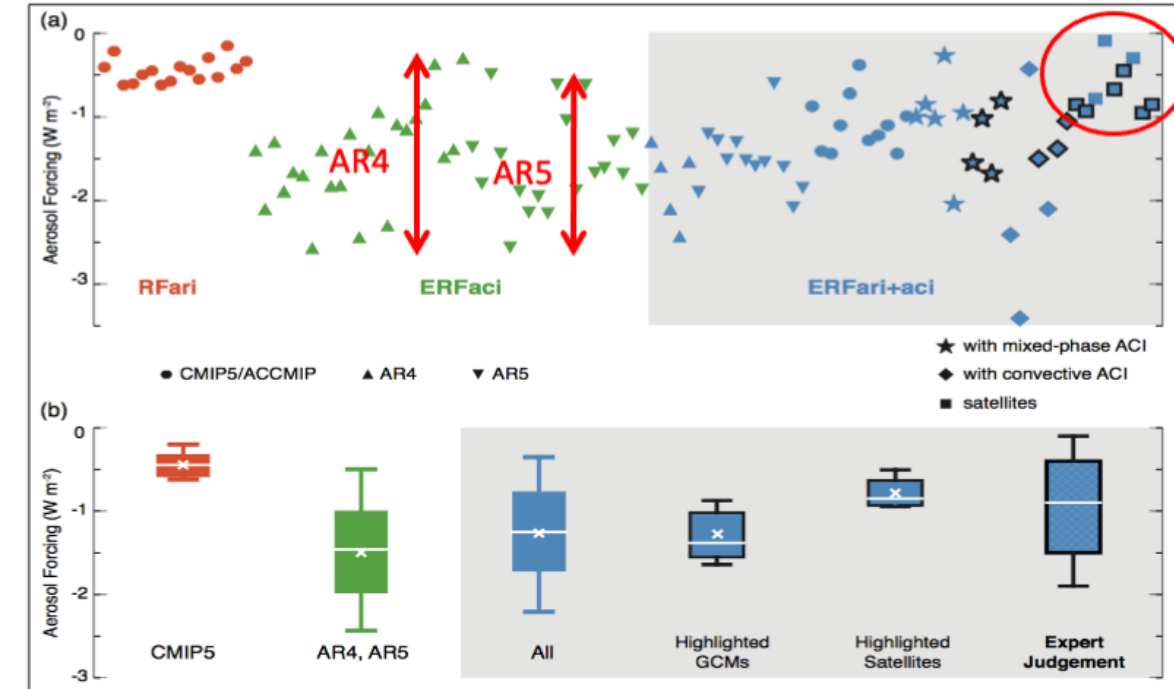

October 1, 2020

# Aerosol effect is a major source of uncertainty

Kiehl (2007)

IPCC AR5 (2014)

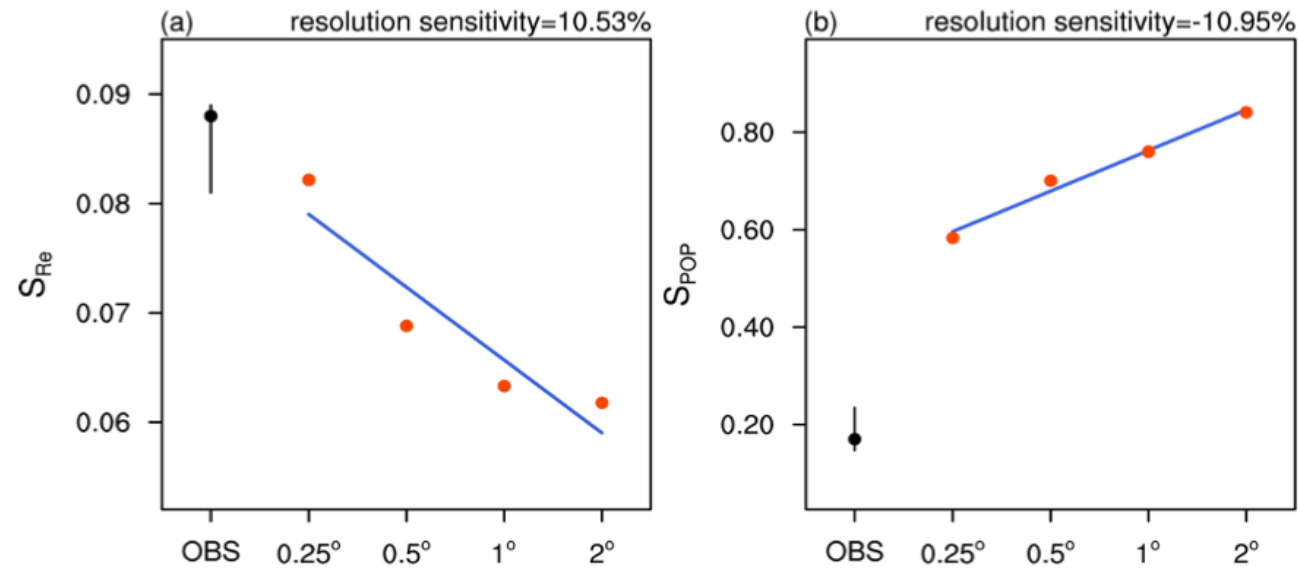

Forster et al (2013)

Smith et al (2020)

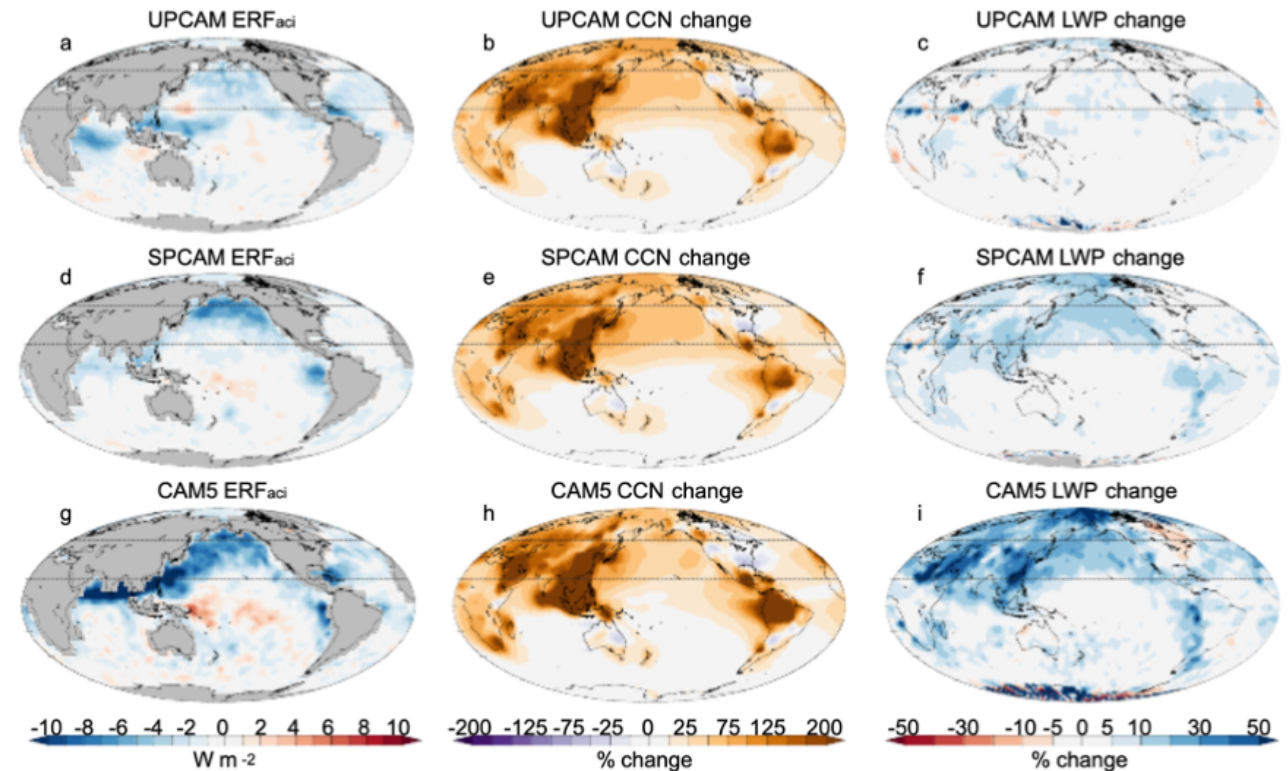

- CMIP3-5: Stronger aerosol effects lead to weaker total forcing and higher climate sensitivity
- CMIP6: New (no?) relationship

# Increase resolution improves agreement between model and observational estimates of ACI

Ma et al. (2015)

Terai et al. (2020)

- Increasing resolution **improves small-scale meteorological features critical for aerosol-cloud interaction**, increasing the agreement of cloud and precipitation susceptibility with observations even though the same physical parameterizations are used.

- Weaker ERF<sub>aci</sub> is caused by a combination of weaker increase in LWP in non-raining clouds and a smaller fraction of raining clouds in UPCAM

# EAGLES

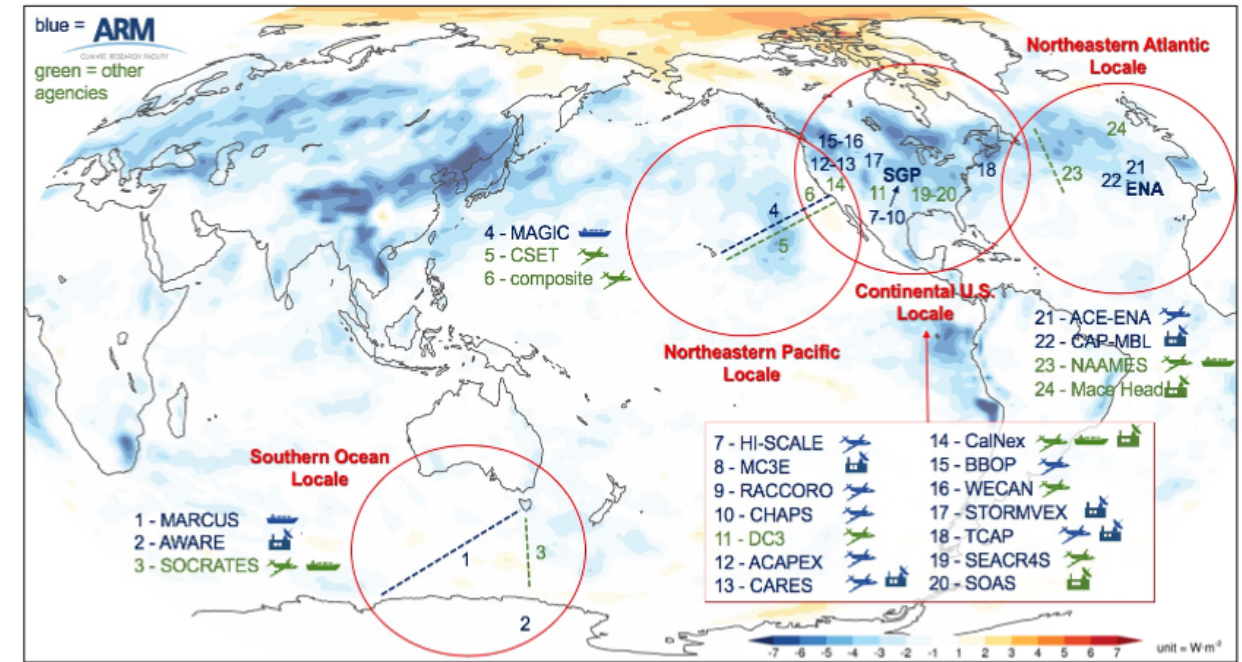

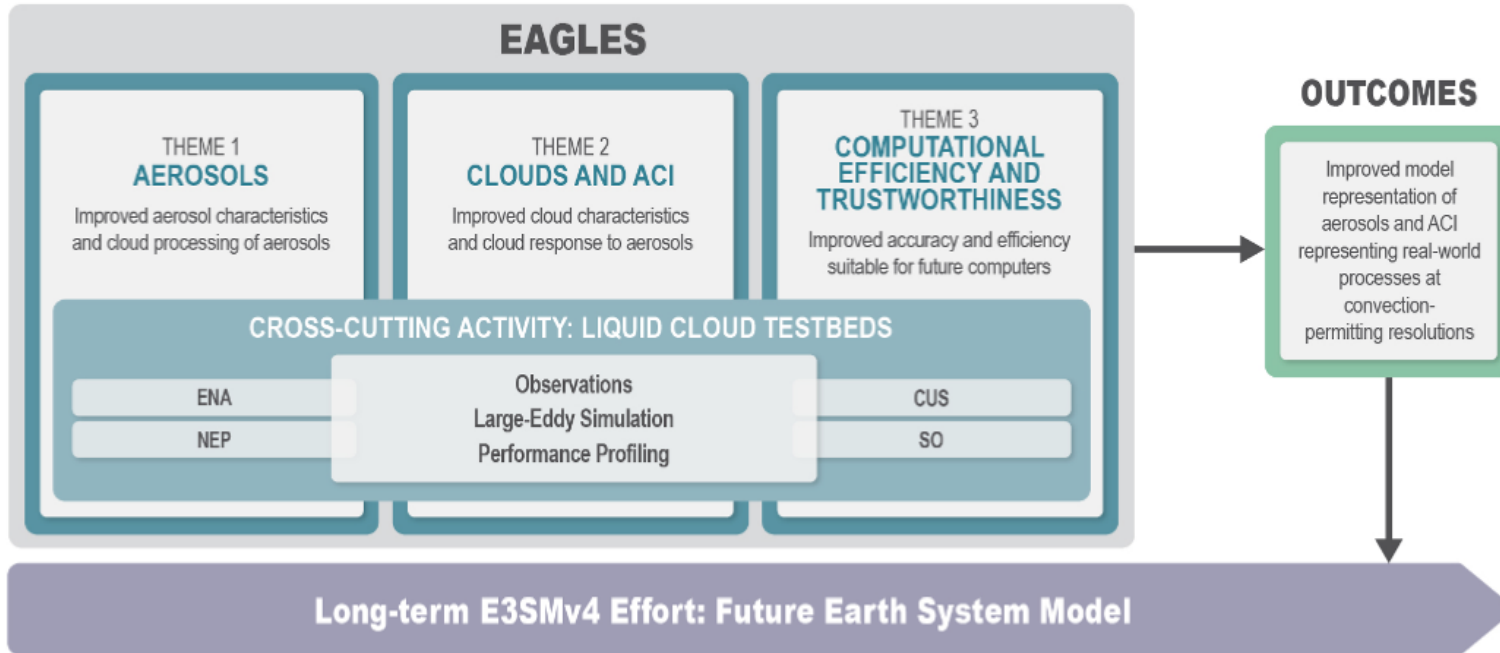

3 model development themes (Aerosol, Clouds, Computation)

1 cross-cutting activity (Testbeds)

Deliver improved representation to run on DOE's GPU-based computers

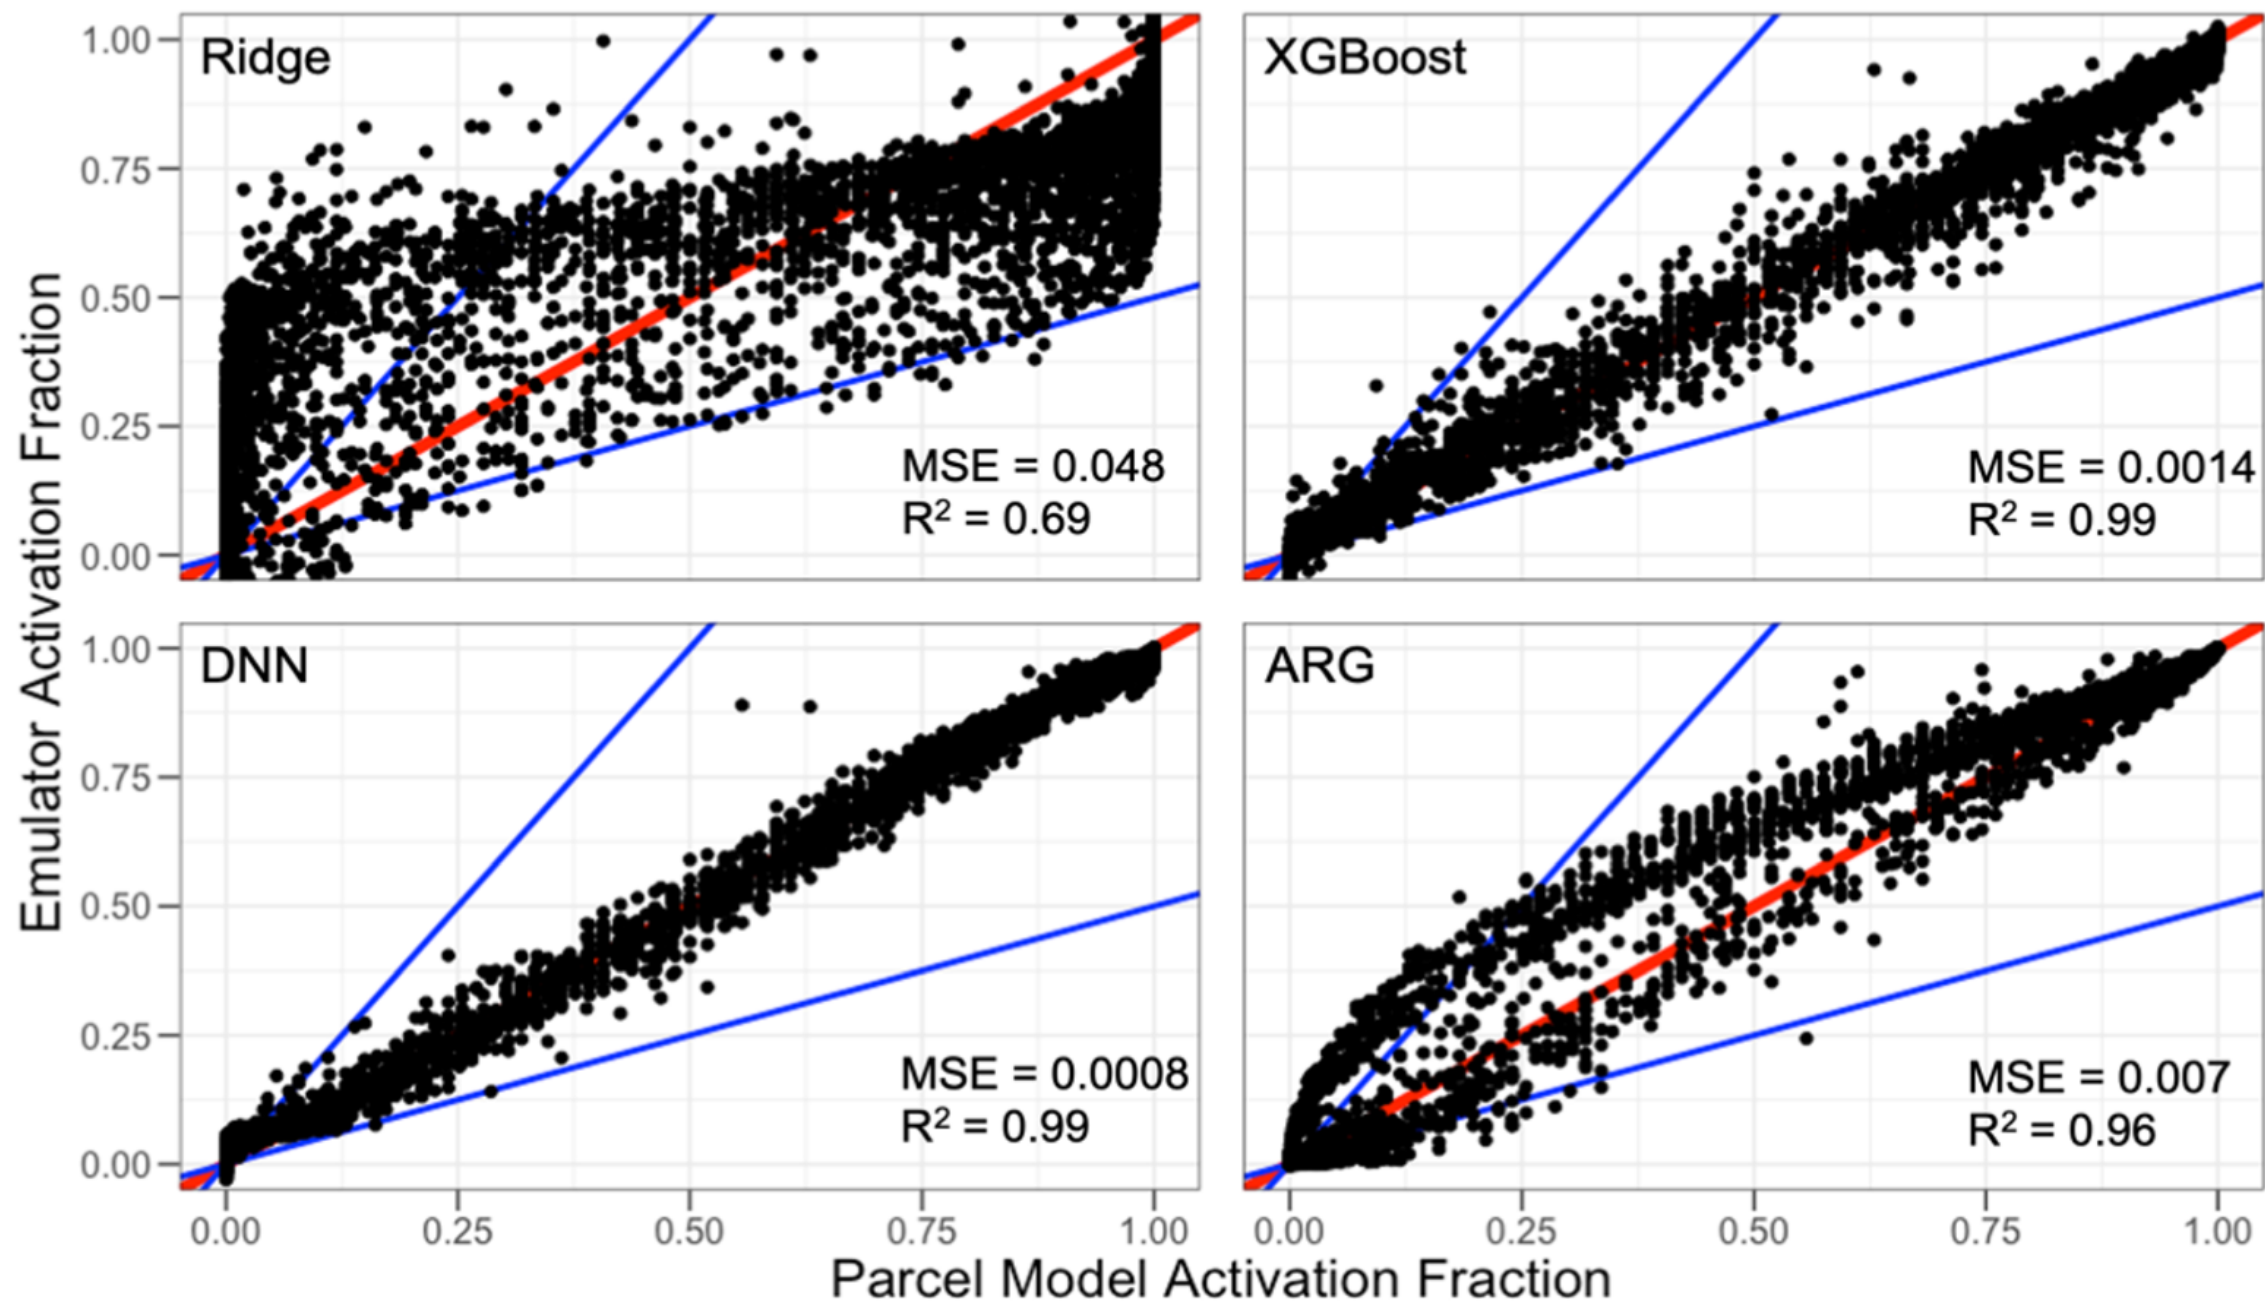

**Vision:** To increase confidence in and understanding of the role of aerosols and aerosol-cloud interactions in the evolution of the Earth system using new modeling techniques that are scientifically robust and computationally efficient for global convection-permitting simulations

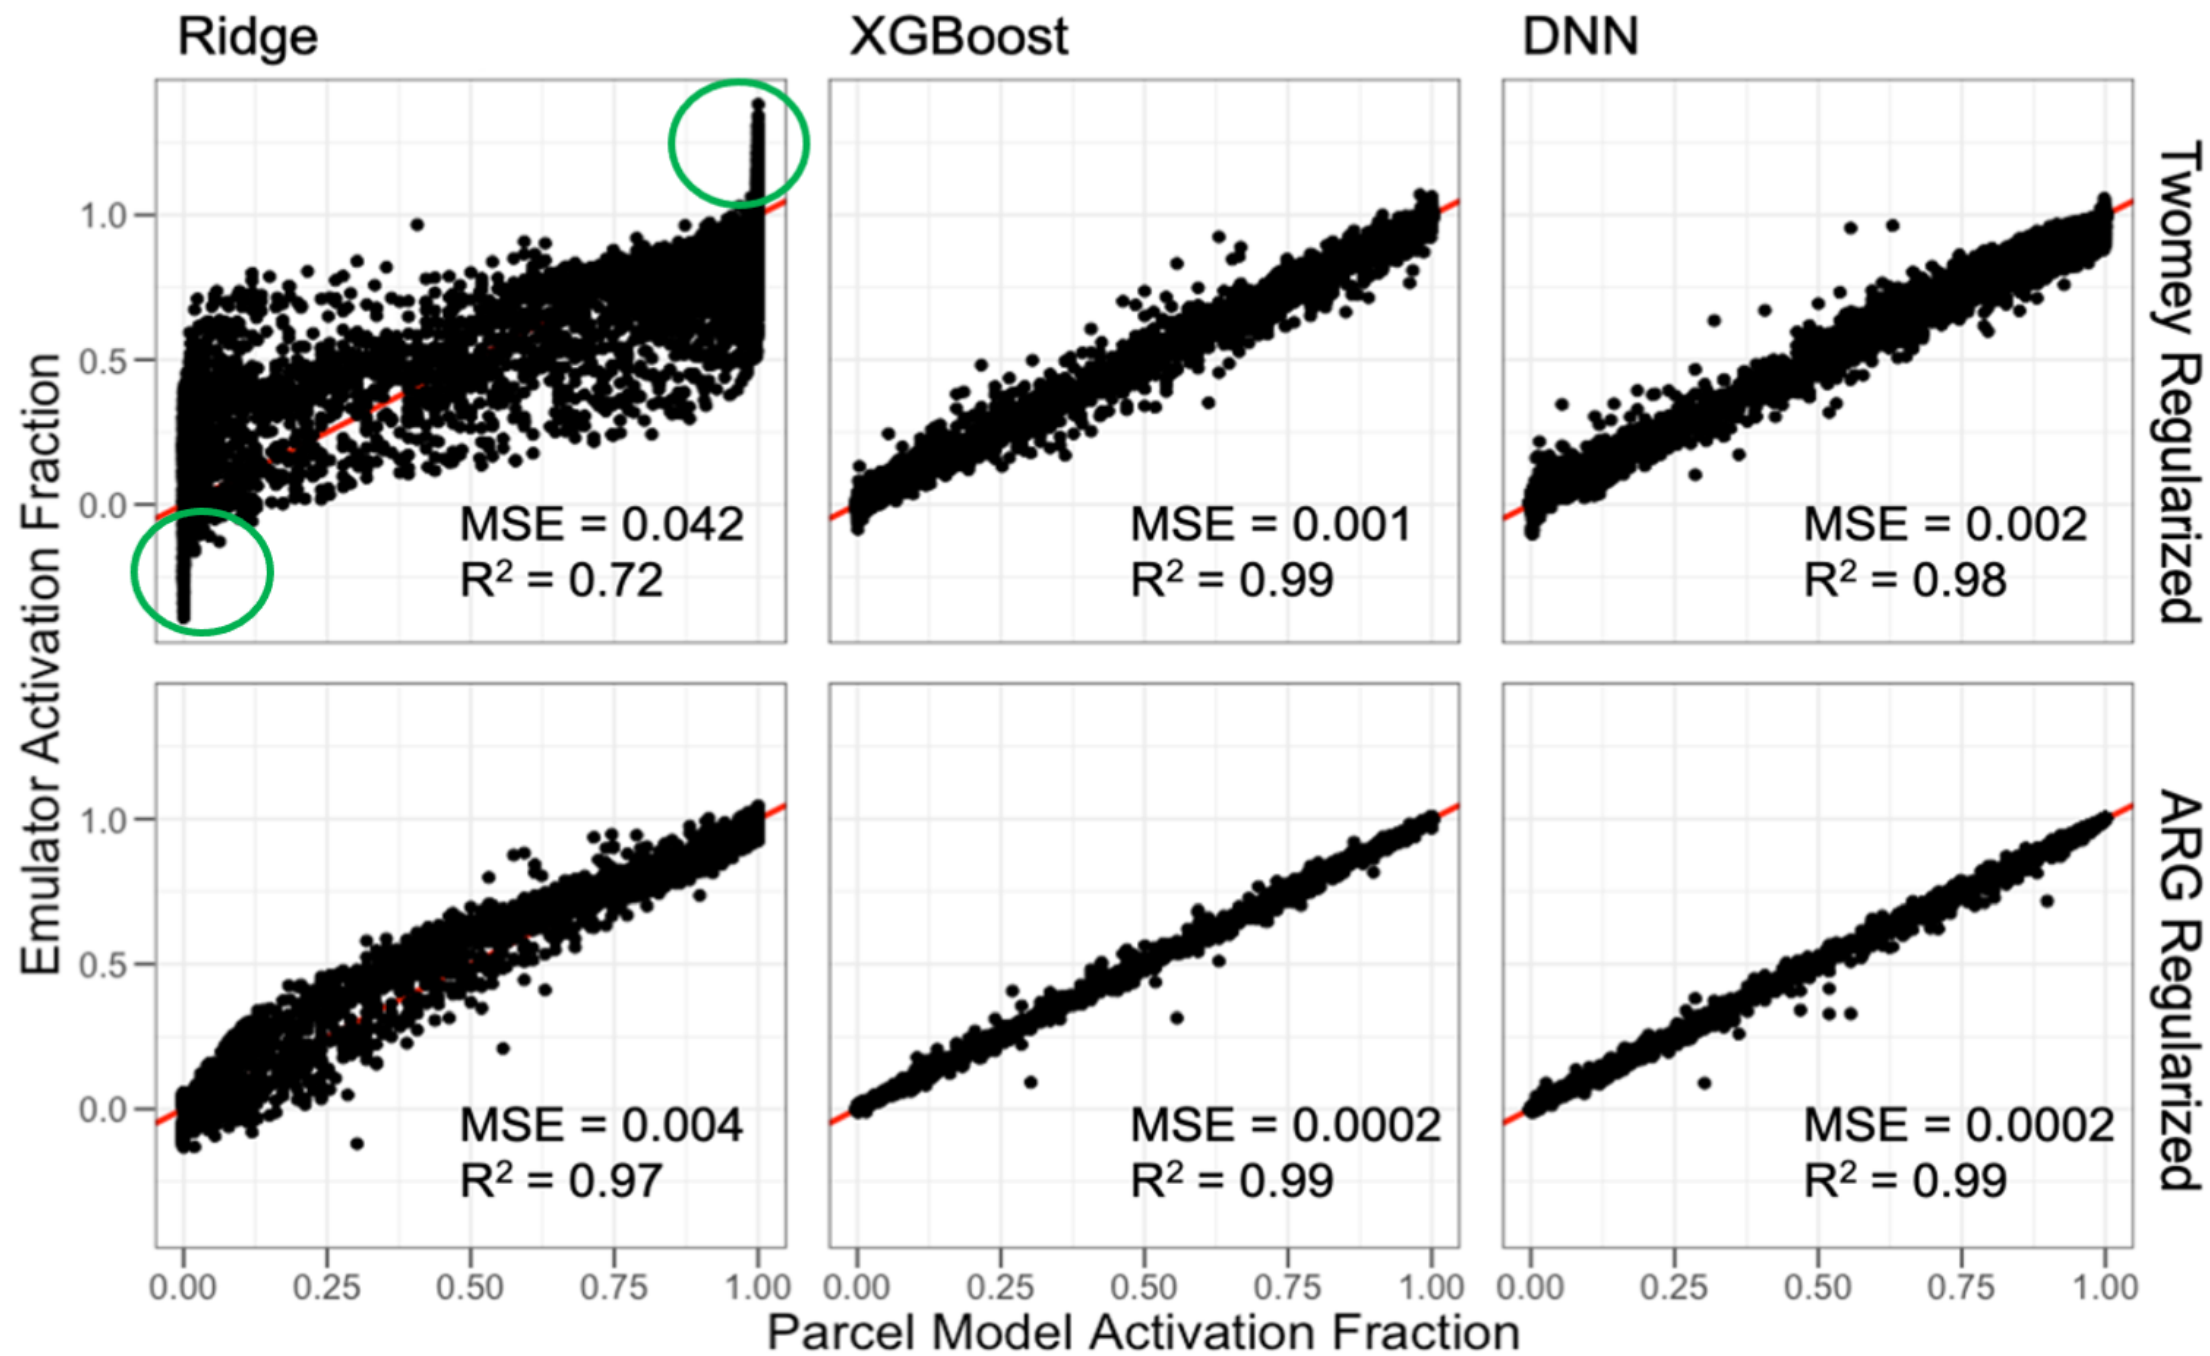

# Activation emulation

Silva et al.

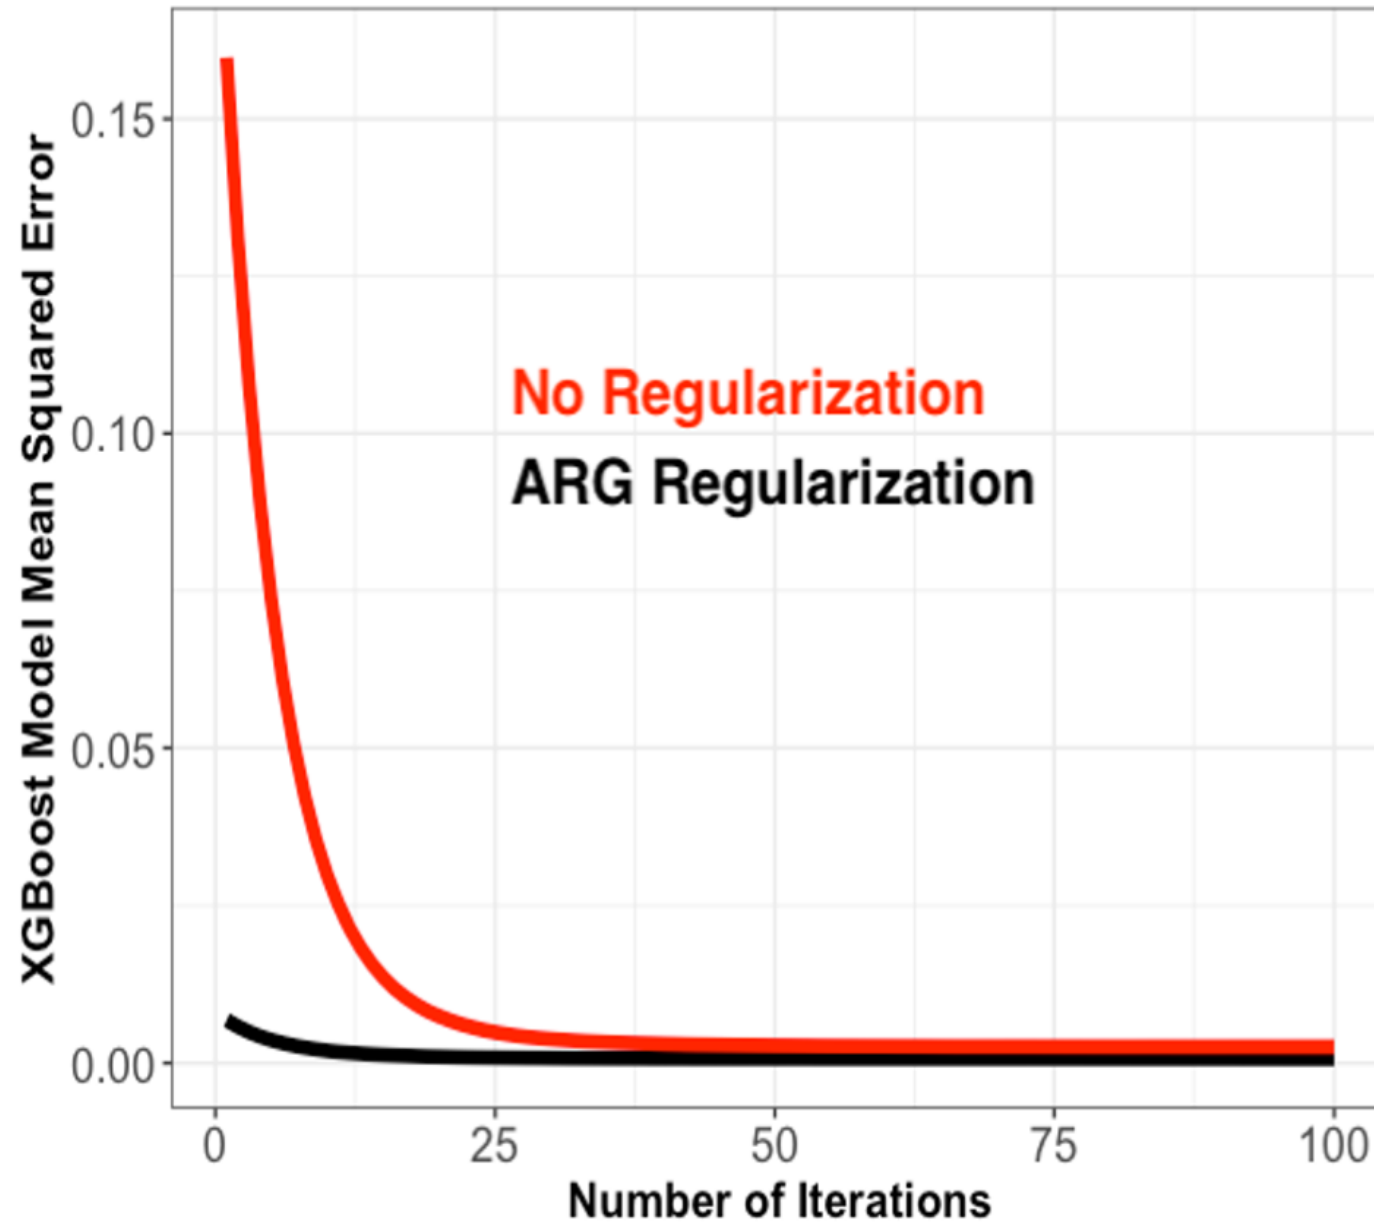

# Use physics to regulate the emulator

Silva et al.

# Physics regularization: reducing emulator complexity

Silva et al.

# New DNN-based activation in E3SM runs smoothly

Silva et al.

**DNN**

## Cloud fraction

Total cloud mean= 65.32 percent

**ANN**

Min = 7.88 Max = 98.67

v1pg2\_f2000 (yrs 2000)

Total cloud mean= 65.40 percent

Min = 7.84 Max = 99.00

v1pg2\_act\_f2000 - v1pg2\_f2000

mean = -0.08 rmse = 0.96 percent

Min = -4.75 Max = 4.16

## Precipitation rate

Precipitation rate mean= 3.06 mm/day

**ANN**

Min = 0.00 Max = 26.06

v1pg2\_f2000 (yrs 2000)

Precipitation rate mean= 3.05 mm/day

Min = 0.00 Max = 27.99

v1pg2\_act\_f2000 - v1pg2\_f2000

mean = 0.01 rmse = 0.19 mm/day

Min = -3.27 Max = 1.57

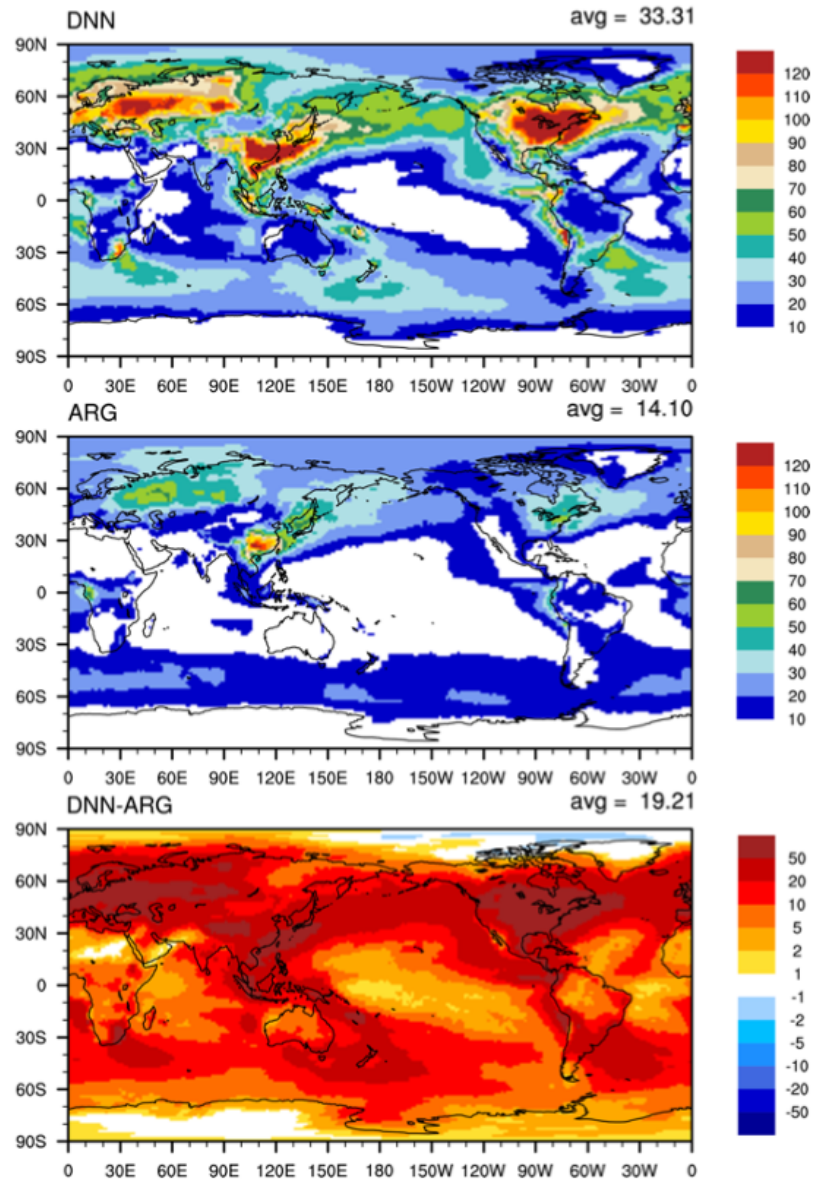

**Diff**

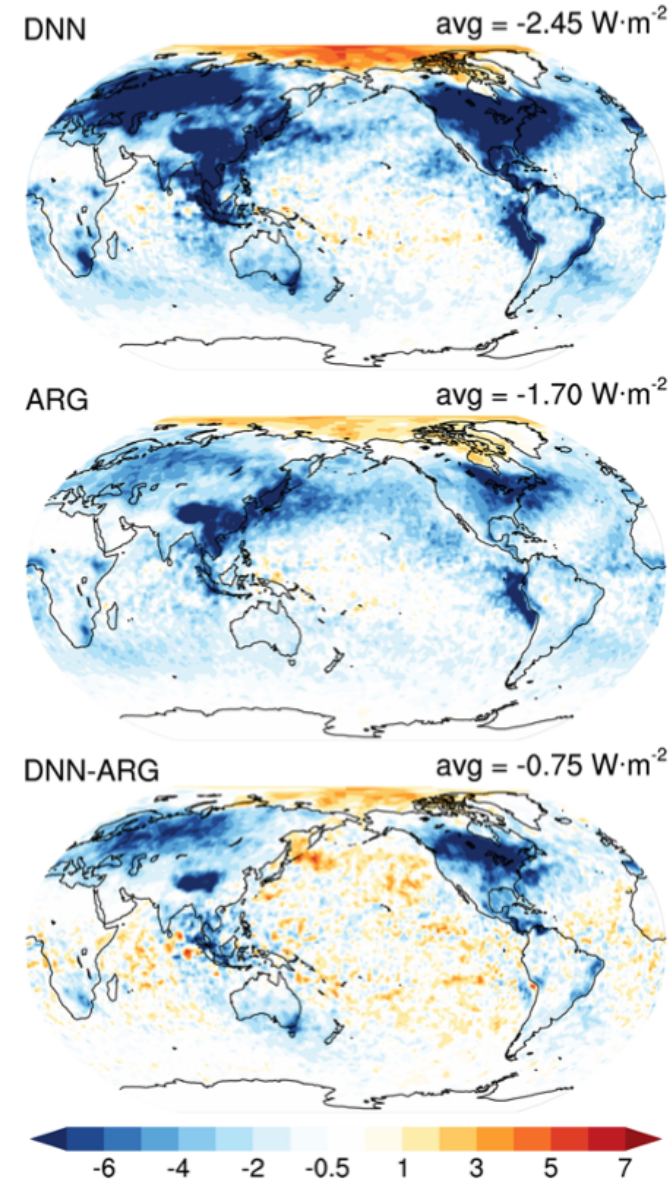

# Some new problems indicates (hidden) issues in the emulator

Silva et al.

Column integrated droplet number concentration ( $\times 10^9$ )

ERFaci

# Software considerations when implementing emulators in E3SM

Singh et al.

- We use Fortran keras bridge library
  - Easy: Provide a text file, link the library, write an interface routine
  - Flexible: do not need to recompile the whole E3SM after replacing the emulator
- Numerical considerations
  - Clipping (input)
    - Assumptions made in other parts of the model: updraft velocity
    - Inconsistent bounds: minimum hygroscopicity in the emulator ( $10^{-4}$ ) vs in E3SM ( $10^{-10}$ )
  - Clipping (output)
    - Fraction between 0 and 1
  - Sampling of training data
    - Comprehensive (Latin Hypercube, MCMC) vs. realistic multivariate PDF
- Computational cost
  - DNN on CPU machines is slightly cheaper than the default E3SM with ARG

# Autoconversion emulation

Pressel et al.

## Objective

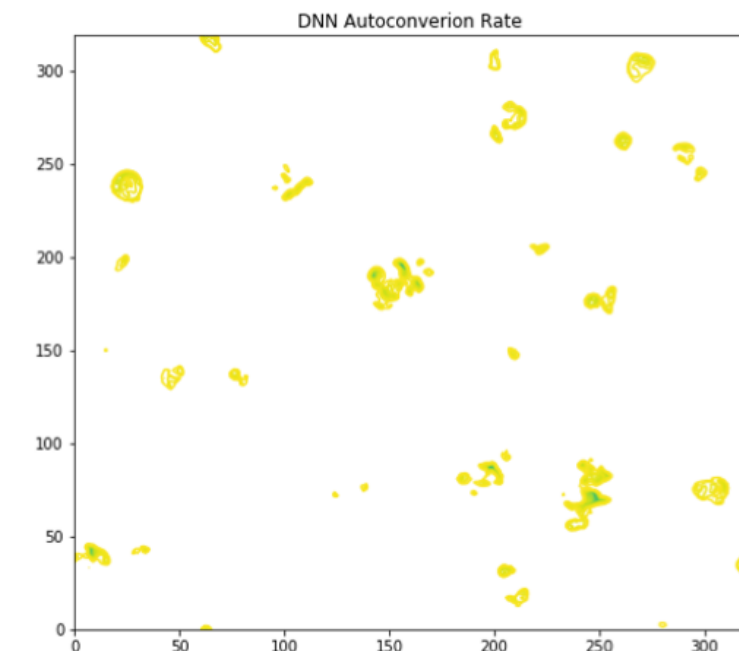

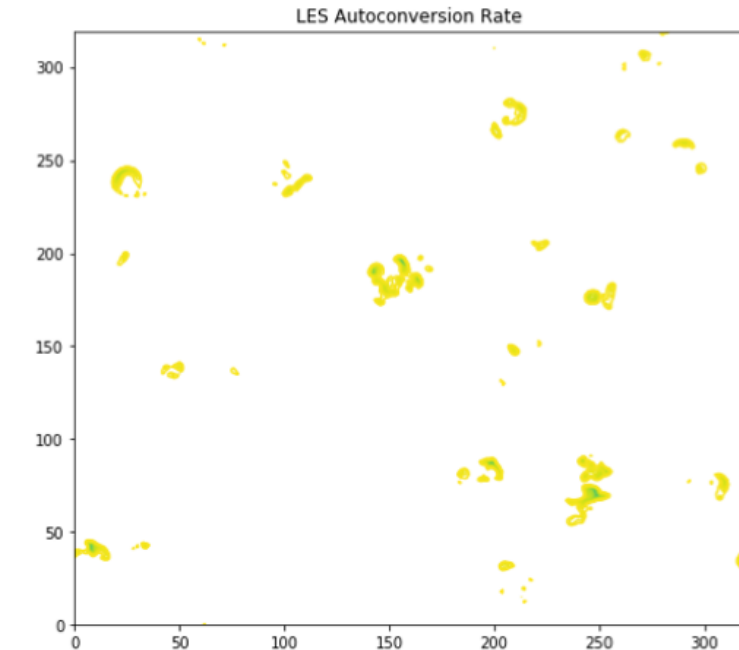

- To develop robust training data sets to be used for machine learning emulation of autoconversion rates for a diverse set of aerosol conditions and boundary layer cloud regimes

## Approach

- A new computationally efficient LES model, Predicting Interactions of Aerosol and Clouds in Large Eddy Simulation (**PINACLES**)
- Coupled with spectral bin microphysics (**SBM**) to explicitly predict autoconversion rates
- Perform a very **large LES ensemble** for a wide range of aerosol conditions and cloud types

## Results

- A proof-of-concept exercise builds a reasonable emulator
- In addition to traditional variables, **meteorological variables** play a significant role in autoconversion rates and need to be included in the training

## Summary

- Successful development of physically regularized DNN that outperforms all existing parameterizations
- Successful implementation of DNN-based parameterization in E3SM with ample flexibility. Computational cost is slightly reduced
- Interface routine has some numerical considerations needed for both the DNN emulator and for the E3SM
- Climate simulations are stable and reasonable, though we see new biases in droplet numbers, pointing to DNN's relatively large bias in low activation scenarios.

## Lessons learned

- Tools are available for inserting a DNN-based parameterization (python-based) in a climate model (FORTRAN-based), but interface routine needs to be designed carefully.
- Emulator development requires close collaboration between domain scientists and data scientists. E3SM with the DNN-based parameterization produces reasonable climate simulations, but new biases were produced. Some iterations between emulator-building (parameterization development) and climate modeling are needed.
- What are we learning? Statistical characterization of model states and process rates or real-world physics?

Thank you.
